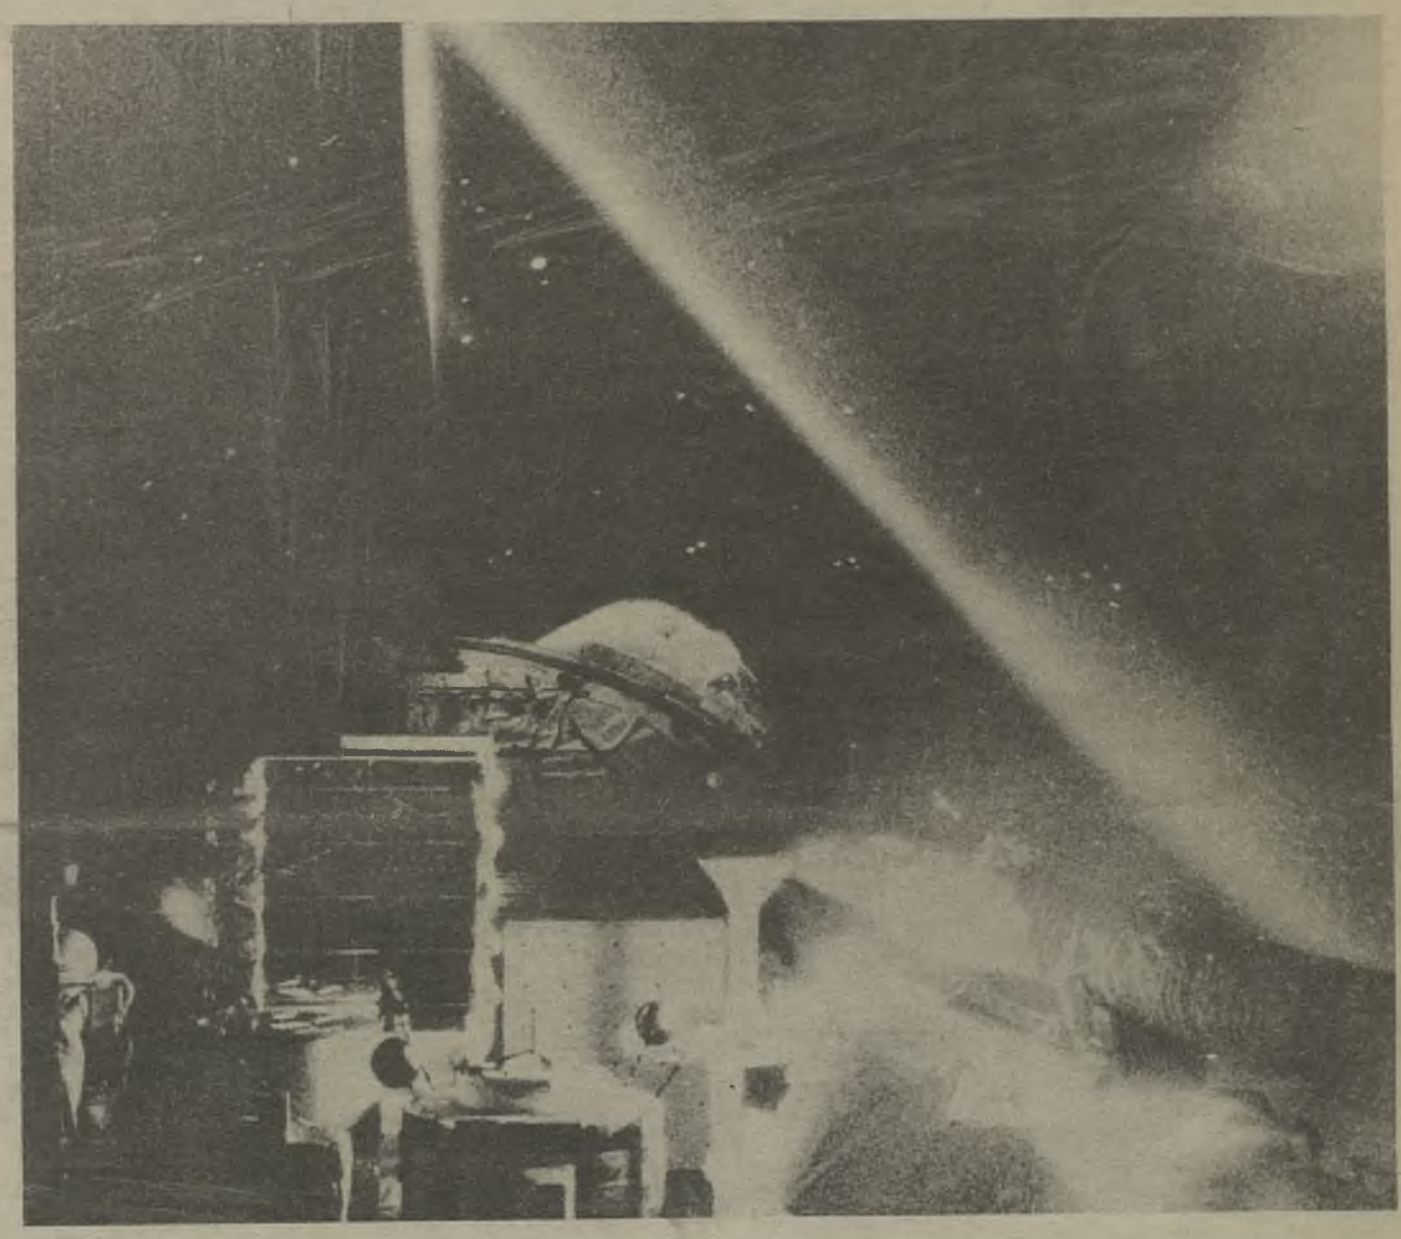
Strike still deadlocked in 12th day

President Donald Kennedy of Stanford Tuesday, Sept. 21, declined an invitation for a personal meeting with Michael Baratz, executive secretary of United Stanford Workers, saying that "the only appropriate forum for resolution of our differences is at the bargaining table."

In a letter delivered to Baratz Monday, Kennedy praised the union for its "restraint" at the San Jose State football game, saying conduct of bargaining unit workers "showed real class."



Replying, Baratz suggested a personal meeting "to present a full explanation of the issues from our perspective. Perhaps we could explore some creative ways in which a settlement could be pursued."

Earlier, Kennedy canceled the pre-game Employee's Day picnic, citing the risk of "serious disruption." Scores of union supporters leafleted 60,000 people attending the San Jose State game. A helicopter with a banner, "Stanford Unfair to Workers" circled overhead.

Federal mediator Dorothy Christiansen met with both sides alter-

Rosse heads new Center for Economic Policy Research

Stanford's new Center for Economic Policy Research, which formally opened Sept. 1, will expand the University's top reputation nationally in economic theory and methodology into the realm of applied policy.

Its faculty will include some of the leading economists in the nation. Its Advisory Board includes such names as George Shultz, William Hewlett, Walter Hoadley, Frank Lodato, Arjay Miller, Anthony Ridder and Thomas Schelling.

The Center has taken two years in planning. It was brought into being by a committee headed by Prof. Paul David, chairman of the Economics Department.

The director will be noted economist Prof. James N. Rosse, who just finished a tour of duty as associate dean of humanities and sciences. The chairman of the Planning Committee will be Prof. Michael Boskin, who has a national reputation in economics and works regularly with the Administration in Washington, D.C.

The main purpose of the Center is to foster research on economic policy among economists at Stanford. "We see ourselves as being concerned with the sort of research that doesn't go to a subcommittee the day after tomorrow. We try to work

Rodriguez tells how to move beyond affirmative action

Moving beyond compliance in affirmative action requires active management, positive rewards, and improved recruitment and promotional opportunities, according to Santiago Rodriguez, Stanford's affirmative action officer.

Since the mid-1970s, Stanford has experienced a "plateau" mentality, with little substantive progress toward diversity, especially in faculty and staff, he declares in a report to University President Donald Kennedy. Other universities face "similar, perhaps even worse" dilemmas.

"No minorities and women currently hold positions in the top administrative ranks," he notes. "Some women, and only a handful of minorities, occupy positions in the mid-level administration. The professoriate is still overwhelmingly composed of majority males.

"Greater success in diversification has occurred within the student body, notably within the professional schools and, to some extent, in the undergraduate ranks. Major problems continue in the graduate programs, which are a vital source of potential candidates for future academic positions."

Successful affirmative action requires an "active" management style, he observes. If it is unreasonable to expect professors to be active, day-to-day supervisors,

Advisory Board chooses Jim Adams as chairman

Prof. James L. Adams, associate dean of the School of Engineering, has been elected chairman of the Advisory Board at Stanford for 1982-83.

The board reviews every appointment, reappointment, and promotion in the professoriate at Stanford. It is composed of seven full professors elected by their faculty colleagues in the Academic Council. The board chooses its own officers.

Nobel Laureate Kenneth Arrow, the Joan Kenney professor of economics and a professor of operations research, was elected vice-chairman. Prof. George Dekker, English, will be secretary.

Other members are Nobel Laureate Paul Berg, holder of the Jack, Lulu, and Sam Willson professorship in biochemistry; Eugene Webb, the Lane professor of organizational behavior in the Graduate School of Business, who holds courtesy appointments in communication and psychology; Robert A. Chase, the Emile Holman professor of surgery and a professor of structural biology; and Donald Knuth, the Fletcher Jones professor of computer science.

Adams, former head of the Department of Mechanical Engineering, recently was named head of the Values, Technology, and Society program. A Caltech graduate, he received both his master's and doctorate degrees at Stanford

James Adams

and has been a faculty member here since 1966.

Author of *Conceptual Blockbusting*, a book on problem solving, Adams received the University's highest honor for outstanding service to undergraduate education, the Lloyd W. Dinkelspiel award, last year. He was cited for his "freewheeling, blockbusting, barn-burning style that makes him an exciting teacher in all known media" and for his "steadfast commitment to the view that engineers and technologists have an obligation to reach out academically to the rest of the University, and beyond it."

Adams was vice-chairman of the Advisory Board last year. Members serve three-year terms on a staggered basis. Only with their approval does the president of the University forward appointment recommendations to the Board of Trustees for final approval.

The Advisory Board also:

* Counsels the president and provost of the University on any matter they submit to the board for advice;
* Initiates its own advice to the president and provost on academic and policy issues about which its members are concerned; and
* Conducts final reviews of faculty grievances and faculty discipline when these matters cannot be resolved except by a formal hearing.

Detailed duties of the Advisory Board are described in the articles of organization of the Academic Council. It is the only group of faculty involved in University governance that is selected by the entire Academic Council.

Cox gets fellowship

Stanford Business School **Prof. John C. Cox** has been awarded a Batterymarch Fellowship to pursue his research interests in 1982-83.

He is one of three academicians from throughout the United States to be so honored. The award, which carries a $35,000 stipend, permits nontenured faculty members to take a year off from teaching to do basic research in investments or finance.

The faculty research fellowships are sponsored by Batterymarch financial Management, an investment advisory firm in Boston.

This is the second consecutive year in which a Stanford Business School professor has been a Batterymarch Fellowship recipient.

Research associate positions

Department of Oncology

This position entails studies on muscle cell differentiation, particularly cell surface changes during myogenesis. We will be using monoclonal antibodies to characterize these myogenic cells as well as to identify the contractile proteins which they synthesize.

Candidates must have a Ph.D. or M.D., postdoctoral training, and demonstrated skills in biochemistry, cell biology, or developmental biology.

Please send applications or resumes to Frank E. Stockdale, M.D., Division of Oncology, Stanford Medical Center, Stanford, Calif. 94305.

Stanford is committed to equal opportunity through affirmative action in employment and we are especially eager to identify minority persons and women with appropriate qualifications.

Department of Opthalmology

The research to be done will focus on mechanisms involved in the active transport of water across the cornea. Qualifications are a Ph.D. or M.D. and a few years of subsequent experience in the area of study; experience with electron microscopy helpful.

Applications or resumes should be sent by October 21, 1982 to Dr. David Maurice, Division of Ophthalmology, Room S030, Stanford Medcial Center, Stanford, Calif. 94305, or you may call 497-5844.

Stanford is committed to equal opportunity through affirmative action in employment and we are especially eager to identify minority persons and women with appropriate qualifications.

Humanities, Sciences announces four new tenured professors

Alban K. Forcione, 43, Princeton University professor of Spanish and comparative literature, is one of four tenured appointments and promotions in the Stanford School of Humanities and Sciences approved by the Board of Trustees Tuesday, Sept. 14.

Jerome H. Friedman, 42, leader of the Computation Research Group at the Stanford Linear Accelerator Center since 1972, was appointed professor of statistics on a 50 percent time basis, effective immediately.

Corey S. Goodman, 31, and Steven George Boxer, 34, were promoted to associate professorships in biological sciences and chemistry, respectively, effective immediately.

Alban Forcione

Forcione, who will come to Stanford in September, 1983, has taught at Princeton since receiving his Ph.D. there in 1968. His research interests have centered on Cervantes, Spanish literature of the Golden Age, and European literature of the Renaissance and the Baroque, for which he recently received a major grant from the National Endowment for the Humanities.

His undergraduate courses have covered such topics as Cervantes, *Don Quixote*, Spanish drama of the Golden Age, masterpieces of Western literature, Renaissance culture, and literary theory. At the graduate level he has taught the literature of European humanism, masterpieces of the European Baroque, Renaissance epic and literary theory, the development of the European short story, the origins of picaresque fiction, Baroque satire and all areas of Spanish Golden Age literature.

Born Nov. 17, 1938 in Washington, D.C., Forcione received his bachelor's degree at Princeton in 1960 and his master's at Harvard in 1961. He has been a full professor at Princeton since 1975. His most recent publication is *Cervantes and the Humanist Vision*, published this year.

Jerome Friedman

Born Dec. 29, 1939 in California, Friedman received his bachelor's at Berkeley in 1962 and his doctorate there in 1967. He joined SLAC after four years as a research physicist at Lawrence Berkeley Laboratory.

Friedman is regarded as the leading force in developing projection pursuit methodology for a large variety of statistical problems. Projection pursuit is a method of fitting regression models when there are many explanatory variables and no strong *a priori* notion of the proper regression model.

He also has used computers to develop a new method of recursive partitioning for classification problems. His most recent publications are *Projection Pursuit Regression* (1981) and *An Adaptive Importance Sampling Procedure* (1982).

His teaching will concentrate on data analysis, computational statistics, and graphical statistics.

Corey Goodman

A Stanford faculty member since 1979, Goodman's research interests center on embryonic development of the nervous system. He lectures extensively on neurobiology and developmental biology in the biology core program. He helped establish the developmental biology program on campus and obtained a National Institutes of Health training grant for predoctoral and postdoctoral students in this field.

Born June 29, 1951 in Chicago, he received his bachelor's degree from Stanford in 1972 and his doctorate from Berkeley in 1977. He was a postdoctoral fellow at UC-San Diego for two years before coming to Stanford.

He has been a Helen Hay Whitney fellow, an Alfred P. Sloan fellow, a McKnight Foundation scholar, and won the Charles Judson Herrick award.

George Boxer

A Stanford faculty member since 1976, Boxer specializes in biophysical chemistry. His primary interest has been to understand the basis of photosynthesis, how plants use the sun's energy to convert carbon dioxide and water into organic compounds. He has inserted chlorophyll into a protein, thus determining aspects of its absorption spectrum as an "isolated" molecule.

Born Oct. 18, 1947 in New York, he received his bachelor's degree from Tufts in 1969 and his doctorate from Chicago in 1976. He has been named a Camille and Henry Dreyfus teacher-scholar fellow for 1980-85, an Alfred P. Sloan Foundation fellow for 1979-83, and was an Atomic Energy Commission predoctoral fellow in 1972-76.

Magician to perform

Muddled magician **Prof. Denis Phillips**, education, will be one of the special attractions at the Beggar's Bazaar, to be held 1-5 p.m. Sunday, Oct. 3, in the Palo Alto Cultural Center's sculpture garden.

The event, a fund-raiser for West Bay Opera, will feature also other entertainment and items for sale. Admission is tax-deductible.

Schimke's team finds clue to why some tumor cells resist anticancer drugs

BY DONALD STOKES

A new line of research at Stanford into fundamental properties of genes gives strong promise of advances in cancer treatment.

Prof. Robert T. Schimke, internationally known for his work in the field of gene expression and protein synthesis, is leader of a team of 20 researchers in the Department of Biological Sciences.

The team is following a new line of inquiry that may change basic concepts of how to deal with malignancies.

The Stanford researchers, who include recombinant DNA and somatic cell geneticists, as well as developmental biologists, tend rows of cell incubators and sophisticated instruments. They probe the process whereby mammalian cells, including human cells, grown in culture develop resistance to certain anti-cancer drugs.

One of the great frustrations of clinicians treating patients with cancer chemotherapeutic agents is the development of drug resistance in the tumor cells.

Why is it that the cancer cells overcome the drugs which physicians use to try to kill the cancer?

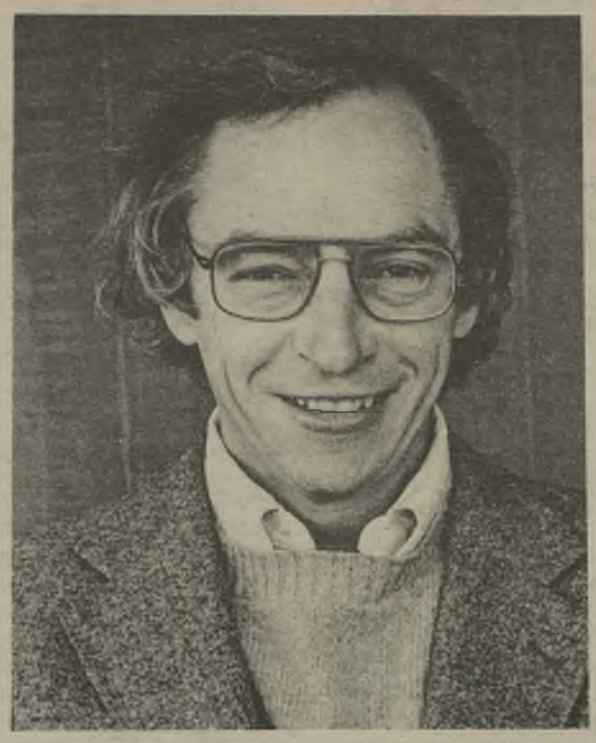
"Because nature, whether it be entire organisms or individual cells, is based on the survival of the fittest," says Schimke. "In terms of cancer cells, the fittest are cells that will grow in the presence of drugs." Various types of mutations, i.e. alterations of DNA structure, occur constantly, and out of this process comes cells that are resistant. Evolution springs from such processes, and drug resistance is a form of such evolution.

This evolutional process occurs in many ways, but what Schimke and his laboratory group have been studying is how cells acquire resistance by increasing the numbers of copies of a specific gene, i.e. gene amplification.

"Cells normally contain only two, or at most, a few copies of a particular gene. What we are finding is that cells resistant to the cancer drug we are studying, methotrexate, may contain as many as 400 copies of a particular gene per cell.

Although Schimke has won international recognition for his research, only this year, at the age of 49, has he been able to devote full-time to research. For the past 14 years he has been chairman of two departments successively at Stanford, editor of several major professional journals, member of a number of national committees, and responsible for a number of other administrative activities.

With these have come national honors, including election to membership in the National Academy of Sciences and the American Academy of Arts and Sciences.



Today he is happily devoting himself full-time to the research to which he committed himself nearly a quarter of a century ago.

"In our laboratory we have been examining the mechanism whereby cultured mouse and hamster cells become resistant to the drug, methotrexate, a chemotherapeutic agent used in the treatment of human cancer," he said. "The drug kills cancer cells by binding tightly to the enzyme dihydrofolate reductase at the same site where the normal substrate, dihydrofolate, would bind.

"If one grows cells in the presence of a low concentration of methotrexate, virtually all of the cells are killed. Occasionally, however, some cells (approximately one in every 100,000 of the cells we have been working with) survive and will grow.

"These cells are then resistant to a low concentration of methotrexate, and they have an elevated level of dihydrofolate reductase. If such cells are now grown in the presence of a somewhat higher concentration of methotrexate, again the majority of cells will be killed, but some will survive and grow; they will be even more resistant to the drug, and they will have even more enzymes.

"By continuing the process through additional incremental selections in progressively higher concentrations of methotrexate, one eventually gets cells that are highly resistant to methotrexate.

We think we are beginning to understand how drugs might be used in therapeutic regimes to reduce the possibility of developing resistance in the tumor.

—Robert Schimke

"It is important to realize that this procedure is equivalent to a Darwinian selection process, inasmuch as most of the cells are killed at each step along the way.

"The selection pressure in this case is far greater than would ever be expected in normal evolutionary processes in mammals. However, perhaps a comparable selection pressure is attained when insects are exposed to a massive application of insecticide.

What causes the cells to become increasingly resistant?

"In very simple terms, because the cells that are selected are those that have undergone a relatively infrequent event of gene amplification. We started this line of experimentation in 1974; this was a time when the various techniques of recombinant DNA, including isolation of messenger RNAs, and cloning specific genes were just being developed in many laboratories throughout the world. In 1977 we found that the reason why cells resistant to methotrexate overproduce dihydrofolate reductase was because these cells have more copies of the gene.

"The fact that you can select drug-resistant cells that have multiple copies of a particular gene was unexpected to us, for we have not entertained such a possibility. Other researchers have begun to look at this type of phenomenon in other cells and with other drugs, and the realization is growing that amplifications of this kind are quite common. For instance George Stark and his colleagues in the Department of Biochemistry at Stanford have found resistance to another drug results from amplification of yet another gene.

"Although we started out this research in cultured cells, we now believe that this type of amplification process occurs in the clinical world as well. We are about to publish two papers which indicate that patients who have been treated with methotrexate and whose tumor cells are resistant to methotrexate have amplified dihydrofolate reductase genes in the surviving tumor cells."

"During the last three years we have also learned a great deal about what chromosomes look like when you have amplified genes."

Schimke displayed microscopic pictures of chromosomes in a drug-sensitive cell taken from a Chinese hamster's ovary. He then compared them with chromosomes from a drug-resistant cell. There was a striking difference. One of the chromosomes in the drug-resistant cells had a long, extended addition to a specific chromosome.

"The extended region of that chromosome contains about 150 amplified genes which cause the resistance," said Schimke. "In some cases we have found up to 400 copies of the gene on a single chromosome. The identical genes are often grouped together in a chromosome as a "gene cluster."

Schimke went on to explain that the drug resistance and amplified genes could be either stable or unstable. When some of the drug-resistant cell lines are grown in the absence of selection (i.e. methotrexate) drug resistance and the amplified genes are lost. "This instability phenomenon in many instances of gene amplification has not been understood in the past, so classical geneticists have tended to ignore it."

"What we are trying to figure out are the molecular and biochemical reasons for the emergence of resistance, i.e. gene amplification. Our most recent findings suggest that amplifications of genes are quite frequent in the cultured cells we are studying. In addition we are finding that certain treatments of cells, including such things as intermittent treatment with compounds that inhibit DNA synthesis increase the frequency of gene amplification. Other types of treatments, including ultraviolet light and use of carcinogens, also increase the frequency of amplification of the dihydrofolate reductase gene.

"We think we are beginning to understand how drugs might be used in therapeutic regimens to reduce the possibility of developing resistance in the tumor. A very important question is whether intermittent treatment of cancer by chemotherapy may, in fact, increase the frequency of emergence of resistant cells. Since intermittent treatment is a relatively standard regimen for drug administration, perhaps more attention should be given to considering mechanisms of resistance in the development of new drugs and treatment regimens so that resistances can be decreased.

"We hope that our studies may shed some light on this area. Once we understand how amplification occurs, it may well be possible to find out how to prevent it from occurring. This may greatly improve the success of treatment in those cases where resistance, unfortunately, develops."

Asked if gene amplification is involved in malignancies, Schimke replies: "As with any relatively new concept, attempts are made to apply that concept to poorly understood biological phenomenon.

"In the past year researchers are beginning to look for abnormal types of chromosome structures in various types of tumors, including breast, lung, brain and bowel tumors. They are finding structures which are suggestive of amplified genes as we have studied them in terms of methotrexate resistance. These chromosome changes occur unrelated to treatment, and probably preexisted in the tumors.

"There is considerable interest in whether amplification of genes is related to the onset of the cancer process, or occurs as part of the process whereby many cancers progress to a more malignant state. There are no answers at the present time, and only more research will tell. It is an exciting time.

Schimke opened one of his incubators and took out containers that held mouse or human cells growing in nutrients. He placed these under the microscope.

MacArthur fellow Charles Bigelow to teach art, computing at Stanford

Charles Bigelow, 37, recent winner of a five-year $192,000 MacArthur Foundation fellowship, will return to the Bay Area this fall as an assistant professor of art and computer science at Stanford.

Internationally known as a type designer, he will teach "Introduction to Grammatology." Grammaton is the Greek word for letter, and the course will cover the art and science of letter formation.

Bigelow credits Stanford computer science Prof. Donald Knuth and the proximity of Silicon Valley with drawing his interests back to the West Coast and teaching.

He has lived in an apartment in Cambridge, three blocks away from the Stanford of the East. "I've been studying at the Harvard evening school three years, but I'm still in the dark," he quips.

Bigelow marvels at the idea that a typographer would be selected for the MacArthur award, which has absolutely no restrictions on its use.

While "the figures involved are embarrassing," he adds, "it's wonderful to work for 12 years and then get a retroactive grant for all the time donated various research projects."

Better letters

His interests have ranged from designing better letter forms for modern computer texts—videotexts, typesetters, and terminals, for example—to finding an appropriate typography for an oral form of Indian poetry.

A graduate of Reed College, where he majored in anthropology and linguistics, Bigelow studied calligraphy with Lloyd Reynolds, Oregon's poet laureate.

"He was a very forceful personality, as well as a scholar and enthusiast," Bigelow recalls. "Reynolds felt that if everyone took a small part of the world under their control that would be a measure of success—that writing beautifully (in calligraphy) could improve communication, for example."

After studying at the San Francisco Art Institute and free lancing for the San Francisco Mime Troupe and the Oregon Environmental Council, Bigelow became art director for the *Oregon Times* magazine, now known more simply as the *Oregon* magazine.

In the mid-1960s Bigelow took a course from Jack Stauffacher—a former book designer for the Stanford Press—which turned his interests from calligraphy toward typography. They formed a small Center for Typographic Language in the City.

In the late 1970s, Bigelow and his partner, Kris Holmes, worked with Dell Hymes, an anthropologist interested in the Chinookan Indian culture to develop an alphabet and design a book for what was largely an oral form of poetry. The National Endowment for the Humanities and National Endowment for the Arts supported this project.

Subsequently, Bigelow was named designer in residence at the Rhode Island School of Design, where he remained during 1978-80 before returning to Cambridge to work on digital typography.

Bigelow calls the Bay Area "very relaxed and easy going" compared to Boston, "where people dress formally, with frowns and furrowed faces, and either get froze nor broiled."

It's a reflection of "Anglo prejudice" to say the East is older than the West, especially for those familiar with the Mission traditions and Indian life, he suggests.

Charles Bigelow

When the call came through from Roderick MacArthur, Bigelow at first thought an eager real estate salesperson might be on the line from California. "But when the caller said he was chairman of the MacArthur prize committee, I knew it wasn't about a house."

And what does he plan to do with the award? "I'll just use it to buy time to keep on working," Bigelow says. He plans to move his studio from Cambridge to the Palo Alto area with his partner, Kris Holmes.

"I don't even own a car, and hope I don't have to buy one, even in California," Bigelow says. "But I might use part of the grant to buy a bike."

Applebee elected to literacy group

Arthur N. Applebee, associate professor at the Stanford School of Education, has been named as a member of the Early Childhood and Literacy Development Committee of the International Reading Association.

The association, with 65,000 members worldwide, is a nonprofit education organization devoted to the improvement of reading instruction and promotion of lifetime reading. Its members include reading teachers, researchers, administrators, reading specialists and others interested in reading education.

Davis receives scholarship recognition

Kingsley Davis, senior research fellow at Stanford's Hoover Institution, has received the highest award of the American Sociological Association, the career of distinguished scholarship award.

Davis also is distinguished professor of sociology at the University of Southern California and Ford professor of sociology and comparative studies, emeritus, at UC-Berkeley.

He has "had a profound impact upon the profession and upon social policy" in a scholarly career of nearly four decades, the ASA citation said. "His voluminous works cover such diverse fields as demography, urbanization and development of Third World countries, family and youth, social stratification, and theory."

Coining the phrase "Zero Population Growth" in 1967, he has been one of the principal exponents of the use of incentives in fertility control policies. He has served as a consultant on population policies and demographic information in India, Nepal, Bahrain, and Latin American countries.

His books include *The Population of India and Pakistan*, *World Urbanization* (two volumes), and *Cities: Their Origin, Growth and Human Impact*. He is editor of *Studies in Population and Urban Demography*, which now includes 18 volumes. His work has appeared in *Scientific American*, the *New York Times Magazine*, *Commentary*, *Foreign Affairs*, and in newspapers generally.

Currently he is writing a book on the demographic changes responsible for major economic and social developments in industrial societies.

Schimke. . .

continued from page 3

objects, cells growing. An occasional cell was rounded up as a ball, cells that were in the process of dividing. In these small objects, seen only with the microscope, may lie understanding of one of mankind's greatest scourges.

Schimke began his career by winning a national scholarship which would have sent him to Yale in the fall of 1951. In February of that year, his draft board sent him an induction notice—the Korean War was then at its height. So he had to quickly find a good university that would admit him right away on a scholarship. This turned out to be Stanford, and he became a freshman in spring, 1951.

He chose a biology major, but enjoyed most the courses he took in philosophy. After three years he entered Stanford School of Medicine, which at that time was in San Francisco. "They were trying to induce medical students to go into research," said Schimke "so the dean took the two students with the highest grades and gave us each a fellowship for a year.

"At that time I was interested in psychiatry and in brain chemistry, so I spent the year in the Department of Pharmacology, where Avram Goldstein had just become chairman.

"I wanted to do my own research. Avram was very supportive and sent me off to Washington University in St. Louis to learn some special techniques from Oliver Lowry."

On returning to Stanford Schimke concentrated on research, and received his own grant from the Lucie Stern Foundation.

Although committed to research at that time, he decided to take an internship and assistant residency in medicine at the Massachusetts General Hospital in Boston.

Schimke made arrangements to work with Herbert Tabor, a well-known biochemist at the National Institutes of Health in Bethesda, Maryland.

"I thought I would give myself about three years to see if I could accomplish something worthwhile in research." He became a commissioned officer in the Laboratory of Biochemical Pharmacology at the National Institute of Arthritis and Metabolic Diseases.

His pattern of research ever since 1960 has been in the same broad direction: he worked to find out what was involved in the regulation of expression of genes in higher vertebrates. Early on in his research he demonstrated that there was a significant relationship between how much urea is excreted by rats and the levels of a series of enzymes involved in the synthesis of urea. His major contribution during his six years at Bethesda was to show that not only are levels of proteins regulated by how rapidly they are synthesized, but also by how rapidly they are broken down.

In 1966 he returned to Stanford as associate professor of pharmacology and biology, and within four years had become chairman of the Department of Pharmacology.

For nearly 7 years the focus of his laboratory work was into the role of steroid hormones, for instance estrogen, in the regulation of protein synthesis. During this time recombinant DNA technology entered the scene and became available as a tool.

In 1978 he began a four-year term as chairman of the Department of Biological Sciences, which he completed on September 1, this year. Now, for the first time in some 14 years, he will be able to give the majority of his time to research.

One of Schimke's great regrets is that so few persons with M.D. training are currently going into medical research. "The problem is obvious. By the time people leave medical school, they usually have debts of over $50,000 accumulated for their education. There is no way they are going to be able to repay that debt as a committed scientist.

"Also, there is the shrinking of monies devoted to basic research, and this makes it most difficult for the beginning investigator."

His own team of researchers is a very mixed one, including graduate students, Medical Scientist Training Program trainees, an M.D. clinical oncologist, as well as postdoctoral fellows, and undergraduate students. Schimke looks on them all as a precious breed, but an imperiled species.

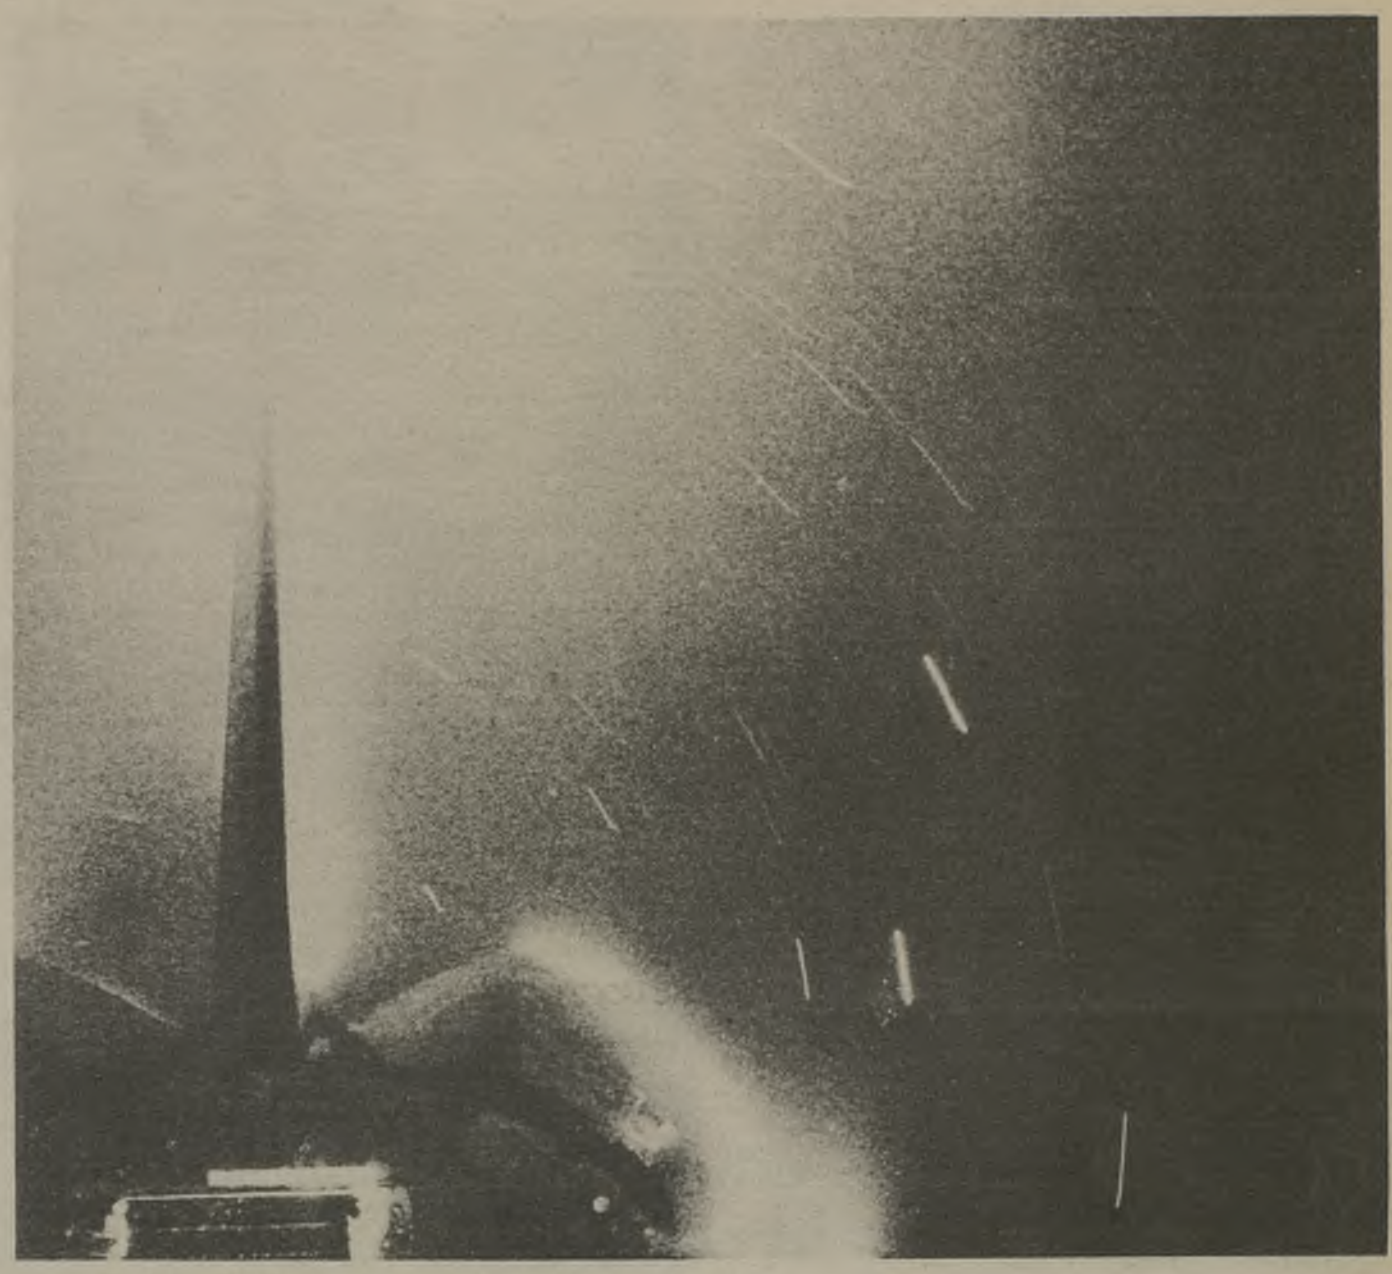
"The problems are so vast and urgent, and researchers so few," he states.

Electron gun in space

Stanford experiment will lead to fancy flying by shuttle

BY JOEL SHURKIN

A joint Stanford-University of Iowa experiment to be carried into space aboard a shuttle in 1984 will require the shuttle astronauts to perform the most complex and difficult maneuvers ever attempted in manned spaceflight.



The astronauts will have to fly in tandem with a satellite for the first time, then aim their craft into elliptical loops around the satellite in order to record streams of electrons fired at it. The maneuver, which is potentially dangerous, has excited the NASA astronauts, according to Stanford researcher Peter M. Banks.

"It gives them a chance to prove they can fly the vehicle," he says.

The flight is scheduled for November, 1984, the second scheduled flight of Space Lab, the European-constructed flying laboratory that fits in the cargo bay of the shuttles. The flight will be the 21st American shuttle flight, probably using the second shuttle, the Challenger, now getting ready for service.

The experiments are designed to study the plasma of the earth's upper atmosphere. Although it appears the shuttles are flying in the vacuum of space they are, in reality, flying through a plasma, a soup of charged particles. In order to study this plasma Stanford scientists have experimented with firing electron guns into space from the shuttle to see how the electrons react.

The electron gun, part of an experiment package called Vehicle Charging and Potential (VCAP) is now being refurbished at Utah State University where Banks and his co-investigator Roger Williamson worked until last year. The electron gun was used on the third flight of the shuttle Columbia.

The space shuttle tail and engine mount glow from interaction with the upper atmosphere for reasons not entirely understood. The curving white lines in the background are stars.

Iowa diagnostics package

Banks, a professor of electrical engineering, said the electron gun will again be used in conjunction with the Plasma Diagnostics Package (PDP) of the University of Iowa.

The PDP will be carried in the cargo bay and lifted away from the spacecraft by the shuttle's maneuvering arm. As with the last experiment, the PDP then will be moved all around the spacecraft as the electron gun is fired. Banks said the scientists are duplicating the earlier experiment because "the results from the first are so complicated that we don't understand them completely. We want to change angles and energies."

What happens next will be new: the shuttle arm will lift the PDP away from the spacecraft and let go. The PDP will become a satellite flying alongside the shuttle.

The astronauts will fly the shuttle away from the satellite to a distance of about 100 meters (110 yards.) They will then begin flying elliptical loops around the PDP, going out as far as 600 meters (656 yards). This will be followed by a series of zigzags, back and forth, and finally, at the end of the mission, flying 5,000 kilometers (3,100 miles) away.

All the while the shuttle electron gun will be firing at the PDP as both pass through the magnetic field lines of earth.

"The exciting thing about it is that electrons are strongly guided by magnetic field lines," Banks says. "I can't just shoot in space; I can't just get from here to there if there is magnetic field."

The field lines run from earth out into space. The electrons would travel along these lines like beads on a string, Banks says.

The shuttle will be flown to within one meter of these lines—"that's incredible flying," Banks says.

Each time they are directly on top of the PDP, and each time they are directly underneath the PDP relative to the earth, the electron gun will go off as they fly through a field line. The beam is about 10 meters (15 yards) in diameter.

"We know the electron beam propagates out to a distance of 15 meters (16 yards); we know its properties. There's tremendous scientific interest in knowing what happens to the electron beam as it propagates to longer distances.

"It's a good target practice problem," he says, "really tough. You can't sense the magnetic field in a physical sense, you have to rely on instruments."

NASA isn't sure just how to fly this maneuver, he says, and will have to set it up in simulators.

"They definitely don't want to hit the satellite. One collision with a windshield will wipe out the whole vehicle."

The shuttle will be carrying a crew of six: two astronaut-pilots, two mission specialists, and two payload specialists. The payload specialists, who will actually operate the experiments, are to be non-NASA personnel, probably from universities or industry.

The shuttle will have rendezvous radar to keep track of the satellite and for part of the time the astronauts will have visual sighting. Although objects in space have no weight, both the shuttle and the satellite will have mass and inertia so collisions are to be avoided.

The principal investigator of Iowa for this experiment is physicist Stanley Shawhan.

Banks says the Stanford group will also be participating in other experiments on the flight. They also make use of VCAP.

As the electron beam shoots off the negatively charged electrons, the spacecraft "sucks" electrons from the plasma to make up for the loss. Additionally, the spacecraft picks up an electric charge by just flying through the plasma. The difference in electric potential from tail to nose is 20 volts. Banks says the spacecraft can pick up as much as 100 volts at nighttime when the gun is fired.

"We need to know more about that because it has impacts for big structures in space, space stations, which will have active electrical equipment on board. . . .

"If you're talking about some of the big space stations you can get potentials of 60-80 volts—and those are real volts. If you make a mistake about how you hook stuff together you can lose semiconductor chips, you can get a breakdown—all sorts of bad things can happen. It's a new environment people have to learn to operate in."

He says it's even possible for an astronaut on a large space station to get substantial electric shock because of this charge potential.

Another experiment involving the electron gun is based on research being done at Boston University. The shuttle will fire off its main rockets which will produce water vapor that will react with the plasma, forming "holes" in the plasma.

The Stanford people will fire the electron gun into the holes to see how they react.

Williamson, a senior research associate, is co-investigator of the Stanford group and Lon Raley, administrative services manager, is project manager. John Raitt is co-investigator at Utah State.

RLG gives use guidelines for members' library facilities

The Research Libraries Group (RLG), of which Stanford is a member, is dedicated to developing cooperative activities to improve library services to its members' constituents.

One of the means of making collections available is by reciprocal access which allows visiting faculty, academic staff and graduate students to use materials in the library, but not to borrow them directly.

Thus, a qualifying member of the Stanford community, upon presenting proper identification, has access to the collections and can anticipate assistance from the staffs of such university libraries as those at Columbia, Yale, Princeton, Dartmouth, Brown, Cornell, Northwestern and Johns Hopkins, among others.

Some RLG libraries do not control access to their buildings or general stacks, but when general library access is controlled, the following guidelines apply:

1. Visiting faculty (including academic staff) and graduate students, upon presentation of their home institution's currently validated I.D. card, will be accorded stack access under the same policies which are applied to local faculty and graduate students.

2. Visiting undergraduates are welcome to use the resources of other RLG libraries. It is expected that the home institution will be able to satisfy most needs. Stack access may or may not be granted.

3. The On-Site Access Policy does not apply to alumni, retired faculty (with the exception of emeritus faculty), fee borrowers, or to faculty and students of affiliated institutions unless such institutions are considered RLG members through the parent institution.

4. The On-Site Access Policy will not override pre-existing local protocols which have governed access between neighboring institutions.

5. The library being visited may request the presentation of additional identification if the institutional I.D. does not include a photograph.

The visiting RLG faculty member or student can expect the following services:

1. **Reference service**—guidance in using the collections.

2. **Photocopy service**—use of photocopy machines at the same rate the local constituency pays.

3. **Data base search service**—Normally, an individual will be encouraged to request a data base search at his own institution. However, special arrangements *may* be made if an institution has access to unique data bases. At libraries which do not charge their own constituency, the RLG visitor may be charged.

4. **Special arrangements** may be made for special needs if arranged in advance, for example, the use of restricted collections (rare books, manuscripts), accomodations for physically limited users, etc.

Interlibrary loan is excluded from the above on-site services. When using the resources of another RLG library it is best to make your visits during regular business hours. A telephone call in advance may be necessary to confirm library hours. For a complete list of RLG member libraries consult the Reference Desk at Green Library.

Joan Krasner

CIT's new rate schedule for the 3081 now in effect

On September 1, 1982, the Center for Information Technology (CIT) announced a new rate schedule for the 3081 node. (The use of the word "node" is in anticipation of the development of the SUNet, the campus computing network; the 3081 node refers to the campus IBM computer located in Forsythe Hall.)

The new schedule reflects a simplification of the rate structure through a consolidation of categories, an adjustment in rates to reflect costs, and a sizeable discount in computing rates during night and weekend periods. It is designed to enable computer users to make decisions more easily concerning the most cost-effective use of the system.

This year, the rate for interactive processing is lower than last year's interactive rate, but still higher than the batch rate. (Interactive tasks are executed at a higher priority than batch jobs, so the interactive CPU rate is higher than the batch rate.)

In addition, the new rates encourage evening and weekend computing through a drastic (65 percent) rate reduction during these nonpeak hours, when the system tends to be under-utilized. Low-cost interactive and Class L services promote further use at night and on weekends.

For Stanford-funded computer accounts, all terminal sessions in night and weekend time blocks are now being charged a flat $2.50 per hour, replacing the usual charges for session connect time, terminal I/O, and up to 30 seconds of interactive CPU time per session. (Interactive CPU time in excess of 30 seconds per session are billed at the normal rate.)

Rates are simpler

Basic print rates are now simplified; separate line and page charges are consolidated into a straightforward charge per page image.

Rates for labor-intensive services, such as tapes and printers, have been increased, to reflect associated costs more closely. (Requirements for the tape storage have exceeded the facilities in Forsythe Hall, and related costs have not been fully recovered in the past.)

The rapid growth in disk use, combined with a reduction in costs for the new 3380 disk drive technology and the difficulty in allocating and supporting disk drives dedicated to specific user communities, has resulted in a simplification in charging for disk use.

Detailed information concerning these rates may be obtained by reading the CIT's Rate Schedule #13 or the next issue of the Computing Bulletin (these are available through the Document Sales office in Forsythe Hall). It is also available online to the 3081 account holders in DOC#RATES PUBLIC.

Personnel update

Insurance meetings slated

Jeannie Thomas, the University's manager of benefits and records, advises that the new life insurance plan open enrollment is off to a very active start.

"We are very pleased with the initial responses and continue to encourage anyone having questions to call the life insurance enrollment center for assistance," she says.

Staff members are available to talk with employees between the hours of 9 a.m. and 4:30 p.m., including the lunch hour, at the temporary life insurance office located in the Old Pavilion.

Employees also may call the life insurance phone number, 7-0757, during the same hours.

During the open enrollment period, September 10 to November 10, open meetings are being held to answer questions and to explain the plan in more detail. The schedule of meetings is as follows:

September 22—9:30-10:30 a.m., Fairchild Auditorium.

October 6—9-10 a.m., CERAS 112.

October 6—2-3 p.m., Fairchild Auditorium.

October 7—9:30-10:30 a.m., SLAC Auditorium.

Thomas wants to remind employees that enrollment forms should be completed and returned to the life insurance center at the Office of Benefits and Records by November 10. Even employees who choose to participate in the free $5,000 life insurance coverage option should complete, sign, and date an enrollment form for beneficiary designation purposes.

Controller's Office classes explain many facets of accounting system

The Controller's Office has scheduled nine workshops in September, October, November and December. The courses are:

1. **Introduction to the Stanford Accounting System** (two two-hour sessions). For employees new to Stanford who monitor either departmental or auxiliary activity expenditure statements. The course includes the organization of the Controller's Office, discussion on account numbers, responsibility for the use of funds and record retention. Practical work includes practice in reading an expenditure statement and in forecasting for future results.

Thursday Sept. 23 and 30, 10 a.m.-12 noon, Room 282, Tresidder.

2. **Travel** (One two-and-a-half-hour session). For employees who need to understand the University's travel policy (Guide Memo 36.7) to complete travel and expense reports. The Travel Workshop summarizes travel policy, defines allowable travel costs, and provides practice in completing the necessary forms for Advances (SU-34A) and Expense Reports (SU-35).

Thursday, Oct. 7, 9:30 a.m.-12 noon, Room 282, Tresidder.

3. **Equipment Administration** (One two-and-a-half-hour session). For employees who are new to the field of equipment administration as well as for those who want to "brush up" and/or need more information on the new computerized system. The emphasis of this workshop is on how to use the manual, forms and reports.

Friday, Dec. 17, 9:30 a.m.-12 noon, Room 112, CERAS Building.

4. **Payroll/Personnel** (three two-hour sessions). For employees completing forms related to Payroll/Personnel actions and record keeping. This workshop includes a review of policies and procedures, and practice in completing all necessary forms.

Tuesday, Oct. 19, 26 and Nov. 2; 10 a.m.-12 noon, Room 112, CERAS Building.

5. **Payroll/Personnel Update** (one two-hour session). This new workshop is planned for administrators and other interested employees to discuss specific topics and common problems encountered in the payroll/personnel system. The topic for this update workshop is Sick Leave Reporting. Short Term Disability forms as well as the Yearly Leave Record (SU-5) will be discussed.

Tuesday, Dec. 7, 10 a.m.-12 noon, Room 112, CERAS Building.

6. **Fund accounting at Stanford and how to read fund statements** (two two-hour sessions). The purpose of this workshop is to teach interested employees the fundamentals of fund accounting as practiced at Stanford. The University's financial statements are discussed as well as fund statements and fund summary reports.

Friday, Dec. 3 and 10, 10 a.m.-12 noon, Room 112, CERAS Building.

7. **Fundamentals of grant and contract administration** (four two-hour sessions). This workshop is planned for administrators and others involved with the preparation of proposals as well as accounting procedures for expenditures, monitoring and forecasting for sponsored research projects. Members of the Sponsored Projects Office will participate in the workshop. The sessions planned are:

1. Introduction and overview of definitions, Federal regulations and the role of SPO.
2. Proposal preparation.
3. Proposal processing and post-award administration.
4. Contract and grant rebudgeting, forecasting and financial management.

Friday, Oct. 8, 22, 29, and Nov. 5; 10 a.m.-12 noon, Room 112 CERAS Building.

8. **Grant and contract administration update** (one two-hour session). This new workshop is planned for administrators and other interested employees to discuss current issues and problems in grant and contract administration. A specific topic will be chosen for each update session. The topic for this first workshop is the closing out of sponsored projects. A panel discussion is planned, followed by guest speaker, Fred Bentley, associate director of SPO, who will speak on current issues.

Friday, Nov. 19, 10 a.m.-12 noon, Room 112, CERAS Building.

9. **Procurement** (two two-hour sessions). This new workshop reviews the procurement process along with criteria for choosing the correct form amongst the SU-10, SU-11, SU-12, SU-13, SU-14, SU-15, SU-34A, SU-34B, SU-35, SU-40, SU-41 and SU-43.

Tuesday, Nov. 16 and 23, 10 a.m.-12 noon, Room 112, CERAS Building.

Send name, department, campus address and phone extension and choice of class to Alice Forbes, 200 Encina Hall.

Robert MacKinnon

High school teacher triggered the musical career of Bob MacKinnon

By Donald Stokes

If a middle-aged teacher had not taken in hand the life of a high school freshman, Stanford would have missed having, for the past 19 years, one of the finest glee clubs in the nation.

During that span of time, Robert MacKinnon has been everything to the club—its inspirer, composer, arranger, orchestral director and universal uncle.

Under his guidance the Stanford Glee Club changed from a forlorn group of seven angry young men into a 60-voice chorus with a 21-piece orchestra that has become well known in every major city on the West Coast. Its reception everywhere is what *Variety* calls "boffo."

On Sept. 1, MacKinnon retired from leadership of the club, and a chapter ended in the Stanford story. But the Glee Club lives on, and with a new conductor, continues to have bookings all over the state.

When MacKinnon was 11 years old his parents separated, and the boy was left with his father, Raymond, who was a traveling insurance salesman. When the boy was 13, the father took his son to Coeur de'Alene, Idaho, to be near his grandfather, who was dying.

It was in Coeur de'Alene High School that the boy's destinty began to take shape.

This was during the depths of the Depression. Because of the scarcity of jobs, the school had been able to recruit some of the finest music teachers in the country.

"It was practically a music conservatory," recalled MacKinnon, interviewed at his Menlo Park home. "Raymond Fahringer was a brilliant violinist, teacher, and conductor. At the school he created two orchestras, two bands, many small ensembles, and instrumental soloists.

"Under Fahringer I learned to play the drums, the tuba, baritone horn, saxophone, and finally the clarinet.

"But another teacher, Evelyn Townsend, did even more. She had graduated from Columbia School of Music in New York, and she was brilliant. She taught German, French, and Italian, in addition to piano and voice, and directed the high school chorus.

"When Miss Townsend discovered that I had what she considered a fine high tenor voice, she gave me lessons five days a week. She made up her mind that I was going to be a musician—and that was that.

"Evelyn Townsend became the center of my universe. Within a year I became her assistant choral director. I was the tenor soloist, the tenor lead in musical comedies, and I did whatever else I could to help out.

"Musical instruments intrigued me, and always will. However, my voice was my greatest asset at that time. It has stood me in good stead all my life."

After graduating, MacKinnon attempted to continue his education at several colleges. Difficulties always seemed to arise—"probably due to my immaturity," he says.

Even now Townsend was very supportive, and at crucial periods she was always behind him. After floundering for a while, he became a dance band vocalist. He also composed and arranged music, and played the saxophone and clarinet.

Musical instruments intrigued me, and always will. However my voice was my greatest asset [in high school]. It has stood me in good stead all my life.

—Robert MacKinnon

At age 22, MacKinnon organized a campus dance band and made his living playing at sorority and fraternity houses on the University of Idaho campus. After two years he was ready to aim higher.

"In Salt Lake City, after almost starving for a few months, I landed a job with a superb dance band called Jerry Jones, and my eating problems disappeared. I was getting a good salary, was earning extra money for my arrangements, and two nights a week I sang solos over the NBC radio network."

It was in Salt Lake City that MacKinnon met the woman who was to become his wife, Carolyn McMullin.

"I never even thought of marriage before I met this wonderful girl. I was then 25. In no time I was proposing to her. She laughed at me a lot and said things like 'I've never planned to get married' and 'Robert, you character, get up off your knees.'

"I don't know how I won her over, but somehow I did. It took a couple of years and many letters. On Dec. 19 we shall have been married 40 years."

Next came San Francisco, where he spent a year playing in a small combo in Chinatown. It was three floors below street level. These were the beginning days of World War II, and MacKinnon was suddenly drafted and put into an Army band.

The band members had little time to perform, for they became part of General Patton's Third Army, hurtling across Europe.

On demobilization, MacKinnon went to the University of Kansas on the G.I. Bill of Rights. This time he buckled down in earnest, and within three years had obtained his bachelor of music degree, with honors.

By this time he had become captivated by composing. A superb teacher of composition at Kansas, Laurel Everett Anderson, made MacKinnon realize that composing had now become his greatest ability, and that he should develop it.

"Since then I have never stopped composing. It is hard work for me, and I am slow at it. Every note has to be right. But I can keep at it day and night, and never grow tired."

His wife Carolyn researched music departments and urged him to go to Yale for his master's degree. "I was a bit overwhelmed, but since Carolyn is

University team analyzes union's latest contract proposal

Following is a Sept. 21 statement to the Stanford community from the University Negotiating Team on the status of negotiations with United Stanford workers:

Mediation/Negotiations

After 10 weeks of negotiations between the University and USW, the Union announced it would convene a general membership meeting on Sept. 8 to vote on whether to accept or to reject the University's last proposal. The night before the meeting, when it became clear the union was not moving toward settlement, the University gave to the Union its final offer, urging the union to consider the offer seriously and to refer it to its membership. The union negotiating team stated almost immediately that it would unanimously recommend rejection. The next day, the membership did vote to reject the University's final offer. On Sept. 10, the Union went on strike.

On Friday, Sept. 17, upon the request of a federal mediator, we agreed to meet again with the union in the hope of achieving a settlement. But in fact we did not. After nearly 10 hours, the result was a union proposal not significantly different from its earlier proposals. This last union proposal is detailed below and its combined costs over two years is at least 23.25 percent and, for many workers, considerably more than that.

The Union's Proposal

The union's proposal provides, *in the first year*, across-the-board wage increases from 10.25 percent to 13.9 percent. The union further proposes increased benefit arrangements which would cost the University approximately another 1 percent on the wage base. Thus, the compensation increase of the union's proposal for *the first year* ranges between 11.25 percent and 14.9 percent per worker.

The union's proposal provides, *in the second year*, an across-the-board wage increase of 5 percent plus a new step 4 of 5 percent. Combined with the automatic step increases of the current contract, this means that each worker would receive at least a 10 percent increase in the second year. Furthermore, the union proposes additional range adjustments for various classifications, comprising over half the workers, of up to 15 percent, costing the University 3 percent on the wage base. This means that USW workers in the second year would receive wage increases ranging from 10 percent to 25 percent. Finally, the union proposes further increased benefit arrangements which would cost the University approximately another 2 percent on the wage base. Thus the compensation increase of the union's proposal for *the second year* ranges between 12 percent and 27 percent per worker.

A demand of such magnitude is simply not reasonable, particularly in this time of national and local economic difficulty.

The University's Final Offer

The University's final offer includes 9.5 percent across-the-board for *the first year*.

For *the second year*, the University's offer is 5 percent across-the-board plus a new step 4 of 2.5 percent. Combined with the automatic step increases of the current contract, this means that each worker would receive an increase of either 7.5 percent or 10 percent in *the second year*.

For *the third year*, the University's offer is 5 percent across-the-board plus a broadening of the new step 4 by another 2.5 percent. Combined with the automatic step increases of the current contract, this means that each worker would receive an increase of either 7.5 percent or 10 percent in *the third year*.

In addition, the University's offer includes a cost-of-living adjustment in this third year if inflation should warrant.

Contracting Out/Use of Temporaries, Students, and Scientists

The latest union proposal on this subject would require the University to provide "prior notice" to the union and then to wait for up to three weeks before allowing *anyone* to do "work customarily and regularly performed by workers."

In these times of increasing economic constraints, particularly in the areas of research grants and contracts, the University needs increased flexibility to meet short-term, staffing needs. The current contract provides protection for individual workers. The University cannot accept the further restrictions proposed by the union.

Wages

The setting of wages is a complex mechanism dominated by consideration of the "markets"—wages paid employees doing equivalent work outside the University. The union's recent flyers attempt, on the other hand, to emphasize comparisons of wages with other employees of the University and of the Hospital, and does so inaccurately.

In point of fact, accurate figures are: across-the-board increases for *clerical workers* at the University over the past three years total to 30.25 percent and for *USW workers* the same total is 27.25 percent. Increases for clerical employees over this period were due to the University's recognition of the changing clerical labor market.

Again, in point of fact, accurate figures are: across-the-board wage increases this year at the Hospital have been 9.0 percent for technical workers, 9.5 percent for service workers, and 10.0 percent for clericals. And, despite the union's claims, *no new steps were added to any Hospital classifications.*

In any event, the labor markets for clerical workers and hospital employees are different from the labor market for USW workers. USW does not represent clerical or hospital employees. USW's focus should be on the workers it does represent. For these workers, the University's offer provides a competitive wage which realistically reflects the comparative labor market.

Benefits

The union has characterized the University's medical plans as a substandard benefit. In fact, the University provides full medical and major medical insurance coverage to all full-time employees completely free of charge and, in addition, contributes to dependant coverage. Whatever some full-time employees do pay for medical insurance is for extended dependant coverage. Because of this structure, whatever rate increases occur, the University's contribution rises accordingly.

In addition, the USW contract includes a provision requiring the University to offer to USW any benefit improvements made for other University employees.

Dignity and Respect

The union suggests that the University's offer is an affront to the dignity and respect of union members and other employees who may be considering unionization. The University's offer is the result of serious and good faith bargaining which responds to the express needs of the workers while preserving the flexibility which is essential to University operations.

Despite this, the union insists it has been forced to strike. The extent of the union's demands only makes us wonder whether the real issue is a fair and realistic settlement for current workers or a settlement which can be used as an organizing strategy for the future.

We recognize the strains caused by any strike. We remain hopeful that the situation will be resolved.

MacKinnon. . .

continued from page 7

seldom wrong about anything I decided at least to apply, and was delighted to be accepted.

"I studied with some excellent men. Quincy Porter was a composer on the staff and was my main teacher. Some useful work was beginning to come out of me, and Porter knew just how to bring it out.

"Paul Hindemith was also working there, and it was exciting to study his approach to music theory and composition.

"But the man who has had the greatest effect on my life is Normand Lockwood, both as a friend and as musician. He has great strength, superior talent (a nationally known composer), and is always willing to help his friends in any manner possible. He is now 76, and turns out music every day of his life."

After leaving Yale, MacKinnon found his first teaching job at Tarleton State College in Texas. He took his wife and baby son to Texas for two years. At the end of that time Carolyn again suggested they move on.

"I'm not sure, but I believe I began to tremble when I asked her what she had in mind.

"She said the next step was to apply for a doctorate. Which state would I like to live in?

"I replied without hesitation, 'California.'

After leaving Yale, MacKinnon found his first teaching job at Tarleton State College in Texas. He took his wife and baby son to Texas for two years. At the end of that time Carolyn again suggested they move on.

" 'And what is the best university in California?' she asked.

" 'I think it is Stanford' I replied.

" 'Good,' said Carolyn, 'we'll go to Stanford.' "

They found that the only musical doctorate Stanford offered at that time was in musicology, "which was the farthest removed from my talents."

There were many outlets for MacKinnon's energies in the Stanford area. He was able to teach voice, play with bands, and compose. He decided to drop his doctoral studies and concentrate on those areas where his talents were best used. He had been on his own barely a year when he was invited to take over the moribund Glee Club.

Although the club had been formed in 1898, it had never had a director who lasted more than three years. Its seven active members were frustrated and angry. They went to the head of the Music Department, demanding credits for membership, department affiliation, and effective support.

The upshot was the offer to handle this hot potato. On being assured that he would be given a completely free hand, he accepted the job.

He called the members together and told them that he would stay for 10 years; that he intended to turn it into a first-class organization; that they would receive credits for their work; and that the club would be attached to the Music Department. The men cheered.

"Your part," MacKinnon told them, "is to bring in the members." This they did. From that time the club never looked back. Very soon they were up to 60 voices in the club, and the supporting orchestra consisted of 21 fine musicians.

As a result of solid backing by Robert Pierce, then director of the Stanford Alumni Association, and his assistant Cynthia Wordell, the club was soon touring all over the state, and its red jackets became familiar in every major city.

MacKinnon did all the arranging, the coaching, and the direction of the orchestra. He even found sponsors who helped provide the money for tours. The club was able to cover nearly all its expenses.

In the early 1970s, by general consent, the club expanded to include women, and for the last 10 years the voices of both sexes have blended in the part-singing.

Since I have been at Stanford so many people have been important to me and the club that it would be impossible to name them all and invidious to pick out a few," said MacKinnon.

Asked whether he will miss his creation, MacKinnon replied: "I shall miss everything except the constant pressures. In running an organization like this the stress is continual, and that I can now do without."

How will he spend his time?

"I shall be busy. I am always composing and arranging, and from now on I shall be able to do this sort of thing at my leisure."

Strike...

continued from page 1

nately from 10:30 a.m. to 7:30 p.m. Friday at the Palo Alto Hyatt. "The parties just aren't ready to settle this dispute," she said. She plans to keep in touch with both sides and "will call a meeting when I discern there is some change in position that would lead toward a settlement."

Strike support continued strong Tuesday, but most campus functions remained close to normal. The University Strike Information Center reported 884 workers staying off the job Friday, declining slightly to 852—or 68.5 percent of those regularly scheduled to work—on Monday. USW said the strikers totaled 1,000 of the 1,350 in the bargaining unit of technical, maintenance, and service employees.

Vandalism diminished, claims and counter-claims escalated, and both sides braced for the return of more than 12,000 students in the coming week, starting with 1,600 freshmen Thursday. Kennedy is scheduled to address them at 7 p.m. in Memorial Auditorium.

Baratz, who requested Friday's mediation session, presented a new union proposal which he said called for a two-year contract with a wage increase of 10.25 percent or $140, whichever is greater, the first year, and a five percent increase plus a full new fourth step of five percent in the second year. It also asked for realignments—assigning jobs to different salary ranges—for science and engineering technicians, crafts workers, and food service and custodial workers the second year.

On benefits, the union asked that any increase in medical premiums be paid by the University during the first year of the new contract and that medical premiums be fully paid up to the amount of the minimum plan in the second year.

Baratz said these wage and benefit proposals would cost the University no more than 11.3 percent the first year and 12 percent the second. The University bargaining team, headed by Priscilla Wheeler, said the union's proposal ranged from 11.25 to 14.9 percent per worker the first year, followed by increases of 12 to 27 percent per worker in the second year. *(See text, p. 8)* . She said the union offer was "no significant change in the differences that separate us."

The University's final offer is for a 9.5 percent increase the first year, with increases of 7.5 to 10 percent in the second and third years of a three-year contract.

Wheeler took strong exception to a union flyer distributed Tuesday which claimed that while "Wheeler told a mediator she was expecting half the strikers to return to work on Monday, justifying her refusal to bargain Friday. This prediction was proved wrong. Once again Wheeler's disrespect and arrogance toward University workers was thrown back at her."

Wheeler denied making any such comment, and Christiansen concurred. "The statement attributed to Wheeler is totaly inappropriate because she didn't say that."

Christiansen added, "I'm not going to be caught in a media war or leaflet war between the parties that does not serve the purpose of mediation."

Baratz Monday claimed "University negotiators felt the strike would crumble and that's why they broke off talks." The union's reasons for striking go "way beyond whether we get another percent or not," he said. "It has to do with the arrogance with which we are treated by Priscilla Wheeler and the people who direct her in what position she should take."

In his Monday letter to Baratz, Kennedy wrote: "Since I publicly criticized United Stanford Workers/Local 715 for some unfortunate incidents earlier in the strike, fairness certainly requires that I praise you for this weekend's restraint. The decision to avoid confrontation at Saturday's game was admirable, and I thought the conduct of Stanford's bargaining unit workers showed real class. Please accept my thanks on behalf of others at Stanford and those who attended the game."

Baratz replied: "On behalf of United Stanford Workers, Local 715, I want to thank you for your letter of Sept. 20 regarding our conduct at Saturday's football game. We are gratified to see your recognition of our reasonableness and would hope that recognition would be extended to the counterproposal we made to your negotiators this past Friday. It was presented by us as a major effort to settle this strike.

"Beyond the above comments, I would hereby request a personal meeting with you as an opportunity to present a full explanation of the issues from our perspective. Perhaps we could explore some creative ways in which a settlement could be pursued. I am available day or night for such a meeting and will await your response."

In his letter Tuesday, Kennedy said "My letter complimented the union's restraint at that event and was intended to encourage similar union conduct in the future.

"I must decline your invitation for a personal meeting. I firmly believe that the only appropriate forum for resolution of our differences is at the bargaining table in discussions between the designated University and union representatives or perhaps between you and Priscilla Wheeler, the University's chief negotiator. I strongly encourage you to explore those avenues."

Construction workers back

Major construction projects brought to a standstill last week, when construction workers honored USW's picket lines, were back in full operation by Monday, Baratz said pickets were voluntarily withdrawn. But the absence of pickets coincided with threatened legal action by contractors at the new student housing complex, Braun music center, and cardiovascular research building.

With freshman orientation due to start Thursday, Sept. 23, and registration for all students set for Monday, Sept. 27, the effects of the strike may be more widely felt.

Administrators have developed plans to feed 3,300 students living in campus dormitories. *(See separate story)*. Ed Scoles, manager of housing and food services, said "nearly normal food service" would be provided during freshman orientation Thursday through Sunday. Students registering Monday and Tuesday will be given cash rebates to purchase one week's meals either on or off campus. Rebates will be made every Monday for the duration of the strike, he said.

Food Service will operate at Wilbur Hall and students will have the option of purchasing breakfast and lunch there on a cash basis when adequate staff is assembled, dinner also will be available. Other options Scoles suggested for students include eating with friends in the trailers or purchasing meals at co-op dorms or Tresidder Union.

Construction delays at the new student housing project last week did not prevent completion of 180 spaces that will open to students Sunday. Several pieces of furniture for the common area will not arrive in time, but otherwise the houses are ready for student occupancy, Scoles said.

At the SLAC main entrance, pickets daily have slowed entry of employees and deliveries, but have not prevented access.

The accelerator is still scheduled to be turned on Oct. 10, despite the srike. "Things are fairly normal considering we have more than 300 workers out," said Bernie Lighthouse, assistant director of personnel at SLAC. Supervisory personnel are working long hours, getting "an amazing amount accomplished." Job-shoppers have been hired to perform critical jobs, he said.

Mail delivery at SLAC resumed Tuesday with new people trained to do the work.

With Stanford classes set to start Sept. 29, Pathology 213 at the Medical School has been canceled for the duration of the strike. An advanced autopsy lab, it would have been attended by three to 10 students. The basic overview course, Pathology 230, will go on as scheduled.

Routine medical autopsies are still being performed.

Scattered incidents of vandalism continued, including damage to sprinkler system pipes and automatic controllers. Grounds supervisor Herb Fong estimated $100 repairs would be required on each of six controllers. Plants that show signs of water stress are being hand watered. Fong also said valves in the White Plaza and Old Union fountains had been tampered with and the fountains flooded. Officials turned off the fountains and drained the water. Fong did not know if there was any actual damage to the fountains.

Four arrests were made Thursday for picket-related activities, bringing the total to five since the strike began.

Strike chronology

Wednesday, Sept. 15: As most construction resumed, pickets moved elsewhere in the University. Some Santa Clara County Transit drivers honored picket lines, dropping passengers on El Camino instead of delivering them to the medical center. A University vehicle parked at the home of a supervisor had its tires slashed. A private vehicle and a University truck were doused with a pungent substance, possibly butric acid, when their drivers crossed the picket line at Bonair Siding.

Thursday, Sept. 16: Pickets delayed a CBS truck containing technical equipment needed for broadcast of Saturday's football game at the stadium. The truck eventually was allowed into the stadium. Two pickets at the medical center claimed they were struck when a truck hit their signs. They were treated at the emergency room for knee abrasions.

At SLAC, a technician was struck by a car which had stopped, then accelerated through the picket line. The driver, a job-shopper, was promptly dismissed by SLAC. The technician was taken to Kaiser in Redwood City, where x-rays showed no broken bones. He was sent home with a bruised leg.

Four pickets were arrested and charged with vandalism. Varrie Booker was accused of throwing spikes under cars Wednesday. Karl Stephen Reimer was arrested while picketing at Bonair Siding, also accused of throwing spikes under cars earlier. Manuel Sanchez was charged with two counts of vandalism and one count of intimidating a witness the previous Friday when a student allegedly was harassed and spat upon. John Richard Sterling was arrested while picketing at the stadium and charged with two counts of vandalism in connection with the cracking of an independent truck driver's windshield Tuesday. In each case, arrest warrants were obtained from the district attorney's office.

Kennedy decided to cancel the Employee's Day picnic set for Saturday.

Friday, Sept. 17: A total of 31 tires on 18 University vehicles were punctured through the sidewalls during the night in the Bonair Siding area. Included were 12 delivery trucks and six emergency generator supply trailers, used to provide emergency power in the event of a major disaster. The union said no confrontation had been planned at the Employee's Day picnic. They announced a Workers' Day rally at 10 a.m. Saturday outside Frost.

Negotiations with the federal mediator were suspended at 7:30 p.m.

Saturday, Sept. 18: Approximately 100 unit members attended a rally, then passed out leaflets at the football game. A helicopter flew over the stadium with a sign, "Stanford Unfair to Labor."

Sunday, Sept. 19: Several pickets distributed leaflets at a tennis match held on campus. Power failure affecting the east side of campus between 4 and 9:40 a.m. was attributed to bad underground calbe, not vandalism.

Monday, Sept. 20: A University truck parked at the home of a supervisor in Burlingame had all four tires punctured during the night.

Tuesday, Sept. 21: Toilets plugged up at Stores.

—Karen Bartholomew, Bob Beyers

Managers to serve frosh meals

Stanford has formed contingency plans in the event that the strike by its technical, service, and maintenance workers is still in effect when students begin to arrive Thursday, Sept. 23, according to Norman W. Robinson, associate dean of student affairs.

Food Service is expected to be most affected by the strike. The University Food Service will provide meals throughout orientation week, beginning with lunch on Thursday, Sept. 23. The meals, to be served in Wilbur and Stern dormitories only, will be served by exempt workers and student hashers, according to Edward Scoles, director of housing management.

Beginning Monday, Sept. 27, the first day of orientation, all meals during the strike must be paid for in cash only. All students who participate in one of the University Food Service Meal plans will receive cash refunds on their room and board payments on registration day.

Refunds, to be given on a weekly basis, will be porated and rounded up to the nearest $5. Students contracting for Plan A will receive a refund of $60 per week, for example, although the actual weekly cost is $58.17. Adjustments to compensate for the approximations will be made when the strike is over and a final accounting is made for each student.

Approximately 3,300 of the nearly 5,000 students who live in campus residences are required to participate in a meal plan.

Meals will be served in Wilbur only. Breakfast will be $1.50, lunch $3, and dinner will not be served until sufficient staff is available.

Students may claim refunds at the Meal Ticket Refund window in Maples Pavilion during registration, and at the Cashier's Office in the Old Union on other days.

Students will be able to pick up their phones as usual, but any necessary repairs on the phones will not be done until after the strike is over. Telephone repairers are not required to cross picket lines.

Only maintenance requests involving health or safety emergencies will be acted on immediately.

—Phil Taylor

Matching funds offer incentive to University

A statewide effort to broaden and increase alumni support of 19 private California colleges and universities already has brought very positive results, Vice-President Kenneth M. Cuthbertson of the James Irvine Foundation told 200 Stanford fund-raising volunteers Sept. 10.

The foundation has made a three-year commitment of $7 million in matching funds to encourage more alumni to support their colleges and to reward increases total alumni gifts to annual funds.

Stanford alumni could earn as much as $2 million in matching funds for the University from the Irvine Foundation if their gift support rises by $3 to $4 million over the next three years.

During 1981-82 more than 37,000 individuals, including alumni, made annual fund contributions totaling $9.6 million, compared to $8.9 million the previous year. Total donors increased three percent, according to Annual Fund chairman Douglas Minge Brown.

Cuthbertson, former vice-president for development at Stanford, said private California colleges and universities trail their Eastern counterparts in alumni gift support. "We're younger, and don't have quite the same tradition" of giving, he explained.

While private California colleges and universities have been "quite successful" in maintaining their student enrollments and are "reasonably healthy" financially, "the uncertainties are fearsome," he said.

The Irvine Foundation matching program is designed to lift the long-term trend line in alumni support and to reduce this great financial uncertainty, he added. The gift matching is limited to alumni as "the heart of the program."

Five institutions began the Irvine matching program last year, including the University of Santa Clara and St. Mary's College in Northern California, and Whittier, Pomona, and Harvey Mudd in Southern California."

In several instances initial response has exceeded expectations.

While primarily designed to encourage broader participation by younger alumni, the matching program at Stanford recognizes there is "enormous room for growth" in gifts from older graduates as well, Cuthbertson said.

Any increase in total gifts from Stanford graduates who earned their degrees in 1968 or later will be matched dollar for dollar. For those whose last degrees were received in 1967 or earlier, the match will be one dollar for every two in increased alumni support.

In addition, the foundation will provide a bonus if the number of donors giving $10 or more increases at least 10 percent from one year to the next. The bonus will be equal to $25 multiplied by the increased number of donors. Thus, if the total number of alumni donors rises by 4,000, Stanford would qualify for a $100,000 bonus.

Cuthbertson noted that the terms of the Irvine matching fund vary by institution. Those with annual funds of $200,000 or less will have any increase matched dollar for dollar.

Other regional matching programs to encourage college gift support in recent years have included the Bush Foundation in Minnesota and North Dakota, the Joyce Foundation in Chicago and the Midwest, and the Hewlett and Bush Foundations for black colleges in the South, he noted.

Kenneth Cuthbertson

The 19 institutions covered by the Irvine program in California enroll about 70 percent of the students in the independent sector.

They include: Claremont Graduate School, Loyola Marymount College, Occidental College, Pitzer College, Scripps College, University of the Pacific, University of Redlands, University of San Diego, University of San Francisco, University of Southern California, Mills College, California Institute of Technology, Claremont McKenna College.

The Irvine Foundation has assets of about $230 million and makes grants totaling $13-14 million a year, Cuthbertson said. About half this support goes to private higher education in California.

Trustees establish new Watkins chair

Stanford's Board of Trustees has established a new endowed professorship to be awarded at the discretion of the Provost for five-year non-renewable terms.

The Howard H. and Jessie T. Watkins University Professorship is the first such chair at Stanford. It is unique in permitting the University's chief academic officer the opportunity to select holders of the Chair from any academic division of the University.

The chair was made possible by a generous bequest from the late Zoe Watkins Johnson, a member of the Stanford Class of 1910. A long-time resident of Pasadena, Mrs. Johnson lived in Laguna Hills at the time of her death in 1981. She specified in her will that a part of her bequest be used to endow a professorship honoring her parents and an equal part be used for scholarships.

Provost Albert H. Hastorf, in commenting on the new position, said, "I welcome the opportunity this chair creates to consider the entire institution in selecting the initial recipient and future holders of the Watkins professorship."

The gift requirement to endow a named chair to honor a present member of the faculty at Stanford is currently $1 million.

Gifts to Stanford slightly lower this year—but still $77 million

Donors gave Stanford $77 million in the fiscal year ending Aug. 31, second only to the all-time high of $79.5 million in 1980-81.

Stanford's volunteer fundraising leader Melvin B. Lane reported the total to the Board of Trustees Sept. 14 at their first meeting of the new year, on campus.

Citing changes in the tax laws, which some believed would discourage charitable giving, and the unfavorable economy, Lane termed the results "gratifying and significant."

Board President William R. Kimball expressed his thanks to all donors who made this year's achievement possible.

Gifts increased by a million dollars in the Stanford Annual Fund.

Corporate giving also showed great strength - $23 million in fiscal '81-82, up from $15.5 million the year before. Gifts from foundations and associations were down slightly over the preceding year, as were bequests.

The only large falloff was in gifts of $25,000 and over from individual donors. In that category, gifts declined from $19.4 million in 1980-81 to $11.3 million in the year just completed. Other universities have reported the same experience, lending credence to the theory that the economy is to blame.

President Donald Kennedy said that even with such excellent results, the University needs more and larger giving to support its programs.

"Considering what's happening to private institutions as a result of actions in Washington," Kennedy said, "we're all challenged to show how much we can do on our own. There is no better evidence of that generous gift support from the private sector."

Electronic system links campuses

Electronic mail systems on 16 university campuses, including Stanford and Sweden's Stockholm University, will be linked in a pilot program funded with $165,000 from the Carnegie Corporation of New York.

The central facilities will be designed and operated by Massachusetts Institute of Technology. The intercampus system, called MAILNET, is a project of EDUCOM, a non-profit consortium of 450 colleges and universities dealing with computers and communications based in Princeton, N.J.

Participating institutions include Carnegie Mellon, Chicago, Cornell, Dickinson College, Harvard, Iowa State, Michigan, New Jersey Institute of Technology, Northwestern, Rice, Southern California, Swarthmore and Wisconsin at Madison.

Gold Spike Awards go to four alumni

Four Stanford alumni, including two former trustees, received Gold Spike awards from University President Donald Kennedy Sept. 10.

The spikes, similar to those which marked completion of the nation's first transcontinental railroad, are the highest form of recognition for volunteer services to the University.

The recipients, limited to four annually, were former trustees Alan N. Weeden, Class of 1947, and Roger Lewis, Class of 1934, both of New York; Douglas Minge Brown, Class of 1950, MBA 1961, national chairman of the Annual Fund, of Hillsborough; and Templeton Peck, Class of 1930, a 40-year volunteer, of Palo Alto.

Weeden, elected to the Board of Trustees in 1970-74 and 1975-80, has "diplomatically but effectively helped the University focus on the future," Kennedy said.

Lewis, who served continuously as a trustee for 18 years after his election in 1964, was cited for "nearly 25 years commitment to Stanford fund-raising at the highest level, giving generously of his time, talents, and own resources, and setting an example for others."

Brown, a senior vice-president with Wells Fargo Bank, has led both the Business School Trust and the Annual Fund to new records in gift support. He is "an outstanding and involved alumnus whose devotion to Stanford is exceptional," Kennedy said.

Peck, a former *Stanford Daily* editor who now directs the *San Francisco Chronicle* editorial page, was praised for "the quantity, quality, and diversity of his service" to Stanford.

Nineteen alumni received Stanford Associates awards in recognition of exemplary service continuing over a period of time. They were: North Baker, of San Francisco; Ronald F. Daly, of Boise, Idaho; James F. Dickason, of San Marino; Leonard Ely, of Palo Alto; H. Anthony Engelbrecht, of Lafayette; Louise Faye, of San Diego.

Also: Bernard L. Gabrielson, of San Jose; Diana Goodwin, of Mercer Island, Wash.; Richard T. Hart, of Watsonville; Yoshio Higashiuchi, of Tokyo; Gregg Ross Hopkins, of Washington, D.C.; Max G. Kolliner, of Los Angeles; Bowen "Buzz" McCoy, of Riverside, Conn.

And: Gunther W. Nagel, of San Francisco; John J. O'Connor, of Washington, D.C.; Stephen W. Player, of Palo Alto; Joseph Rodgers, of Los Altos; George E. Stephens Jr., South Pasadena; and John A. Young, of Portola Valley.

Eleven alumni received outstanding achievement awards for their work in a single year. They were: Kenneth A. August, of Los Angeles; Jack Byron Boyer, of Florence, Italy; Hans L. Carstensen, of Alexandria, Va.; William A. Corbus, of Juneau, Alaska; Bert T. Edwards, of Rockville, Md.

Also: Millett F. Keller, of Anchorage, Alaska; E. Tyler Miller Jr., of Rancho Santa Fe, Cal.; Lili D. Pratt, of San Francisco; Margaret P. Simmons, of Dallas, Texas; Roger C. Sullivan Jr., of Washington, D.C.; and Kathleen Ann Welton, of New York City.

Fair, rather than equal treatment should be managers' aim

continued on next page

then others should be clearly given this responsibility.

"In too many instances at Stanford, supervisors appear quite distant from their employees and show little concern for their development as human beings and productive employees," Rodriguez says.

Supervisors often try to avoid conflict at the expense of sound human interaction. "In racially and culturally diverse settings, the failure to manage actively can often result in heightened tension, increased turnover, lower productivity, and a larger number of equal opportunity complaints," he notes.

Managers should treat individuals fairly under a single set of standards for job performance. Some are reluctant to criticize poor performance by women or minorities because they fear a grievance or feel "sorry" for a particular group; others are much less tolerant of errors by women or minorities than those by majority males.

Accurate, honest performance evaluations are critical for any employee, he notes. A large number do not receive even one evaluation yearly. This failure becomes critical when an individual is terminated for cause but was unaware of any performance deficiences.

Cultural baggage

Poor management or "erratic" behavior by supervisors account for about three-fourths of the individual complaints which are brought to the Affirmative Action Office, Rodriguez says. " Because all of us bring 'cultural baggage' to the job, many minorities and women perceive bad mangement in general to be discriminatory behavior."

When friction does arise and a termination may be in the offing, supervisors may adopt a "passive" management style and turn the controversy offer to a staff affairs officer. In these instances, the University should either insist on greater direct involvement by the supervisor or give the staff affairs officer clear responsibility to act as the supervisor.

Affirmative action should be more clearly used as a basis for evaluating the performance of managers, and those who perform well should be rewarded. This could be done through public letters of commendation, salary increases above and beyond those otherwise warranted, or through special rewards to departments which have performed well in affirmative action.

In recruitment, very little attention has been given to using existing female and minority sources in an effective manner, he says. Stanford alumni might offer help. The Development Office has recently begun to contact minority graduate for recruitment assistance, for example.

The University also should consider developing more formal career ladders for nonacademic staff, Rodriguez believes. Annual turnover rates, including mobility within the University, now approach 60 percent in most clerical categories. About 25 percent of the staff leaves in University annually.

"Much of this movement may be unavoidable, but the rate might be reduced if people saw clearer opportunities for advancement within the University," he says. The Sponsored Projects Office has designed a system to encourage capable employees to move into better positions, for example.

Besides trying to identify logical "tracks" for advancement, carefully constructed "bridges" between nonexempt and exempt positions could be created. Among the classifications for which such bridges might work are office assitant or secretary to administrative assistant; accounting technician to accountant; and library specialists and possibly some of the "technician" job groups.

More informal mentoring of new employees, especially those in managerial positions, might be useful for affirmative action, he adds. "A great number of minorities and women experience problems in adjusting to the cultural and organizational style of the University.

"Turnover rates for exempt minority staff are probably aggravated by the difference in style, as well as the feeling of isolation resulting from the very small presence of minorities in administrative and policy positions."

Affirmative action should be more clearly used as a basis for evaluating the performance of managers, and those who perform who perform well should be rewarded.

—Santiago Rodriquez

During the past year and a half, the Affirmative Action Office has provided about 400 managers and supervisors a course on conceptual and practical aspects of affirmative action.

"Few individuals can draw a distinction between equal opportunity and affirmative action," he notes. "Equal opportunity, simply put, is a policy of passive nondiscrimination. It is race and sex neutral and focuses on the 'rights' of individuals based on merit. Equal opportunity's legal origin is legislative and assumes perpetuity.

"Affirmative action, on the other hand, focuses on the 'rights' of groups and is race and sex conscious. It is a process to achieve equal opportunity and, by definition, must be temporary.

"Premised on executive order, rather than specific legislation, affirmative action requires efforts to remedy the effects of past discrimination *but not at the expense of merit consideration*.

"Under affirmative action, for example, if engineering has traditionally been a 'male' occupation and if in recent years the number of women in that occupation has risen dramatically, then an employer develops a sex-conscious recruitment effort to enlarge the recruitment pool with women. Efforts are aimed at those institutions generating women engineers in order to enhance the likelihood of obtaining women in the recruitment pool.

"The evaluation criteria that are used to identify competitive engineers must be as objective and job-related as possible.

"In the selection process, equal opportunity supercedes affirmative action considerations. In other words, the best qualified person is selected.

"Only in the unlikely instance when two individuals appear similarly qualified can race or sex conscious selection be made. In that instance, in a job category where minorities or women have traditionally be absent, the institutional value placed on diversity can serve to make the nontraditional candidate more qualified."

Many minorities and women argue that the standard used for evaluating their work performance varies considerably from the standard for white males: where white males are presumed competent, minorities and women are presumed incompetent until proven otherwise. In every case, Rodriguez emphasizes, the criteria used for evaluating job performance must be based on the work itself.

"The myth exists that 'equal treatment' is the desired objective in any managerial decision involving people. I would argue that fair, rather than equal, treatment should be a more basic aim.

"Standards relating to performance and conduct in the workplace should indeed be equal. Yet, at the same time, we know that different people are motivated and perform differently precisely because they are individuals."

Accurate, honest performance appraisals are critical to any employee, regardless of sex or race.

While the number of complaints filed by Stanford employees with external agencies has risen, "to my knowledge, the University has not been found to have acted discriminatorily in any specific instance by an enforcement agency, such as the U.S. Equal Employment Opportunity Commission or the California Department of Fair Employment and Housing," Rodriguez says. "One case, however, was apparently resolved through the conciliation process.

"A limited number of complaints have been filed under Title IX provisions, but the University was also sustained in these instances. No complaint has yet been filed with the Office of Contract Compliance Programs."

Procedural improvement

Among the procedural improvements he suggests are these:

"In view of the number of grievances relating to tenure conversion among the faculty, more specific guidelines to the schools and departments outlining the respective roles of affirmative action and equal employment opportunity in the process would be useful.

"Better coordination is necessary in disciplinary personnel action or terminations involving minorities and women. At a minimum, the Affirmative Action Office should be informed at an early stage if problems are devloping with a staff employee. In this way, the office could possibly play a more constructive role and help avoid some formal grievances.

"The University's policy on sexual harrassment should be reviewed with possible coordination in mind. Specifically, a central 'clearinghouse' for information should exist." Appropriate individual and offices should meet to identify problem areas and review sexual harrasment allegations for purposes of better training.

In addition, the philosophy and effectiveness of present grievance procedures generally should be reviewed by the task force on personnel. "A significant number of employees, irrespective of equal employment opportunity or affirmative action issues, place little credence in the internal grievance procedures," he notes.

"While this phenomenon may be a fallacious perception on the part of employees regarding the utility and fairness of the procedures, the fact that the perception exists is troublesome."—**Bob Beyers**

Carpools

Looking for a ride or shared driving from Santa Cruz, 8-5. Gordon Muir, 497-3380.

Need rider from Los Gatos/Saratoga area arriving at Stanford 7:30 a.m., leaving 4:30 p.m. Call Gloria, 497-4970.

Want to join or form carpool from Sunset Dist., S.F. (near 19th Ave.) to Stanford, T-F, 9-5 or 6. Robert, 753-3860 or ext. 7-4116.

Rider needed for existing carpool from Newark to Stanford. Leave 7 a.m., return 4:45. Call Mark, 7-4342.

Want to join or start carpool from S.F. (Parkmerced) to Stanford. M, W, Th, F 8-5 (but times negotiable). Call Jim Gibbs at ext. 7-3912 or 586-9354 (evenings).

Trustees take action on faculty member appointments

Two Medical Center faculty members have been promoted to professor, and four others have been named associate professor by recent action of the Board of Trustees. A seventh faculty member received tenure as an associate professor.

The two new full professors are Drs. William Brody, radiology and electrical engineering by courtesy, and Samuel Strober, medicine.

Brody, an associate professor since 1977, has attracted worldwide attention for his research into the use of advanced radiologic imaging techniques. He founded and serves as director of the advanced imaging techniques laboratory at Stanford.

The multiple energy imaging pioneered by Brody involves pulsing X-rays of different wavelengths, making it possible to precisely identify various types of tissue being scanned.

Brody received his M.D. in 1970 and his Ph.D in 1972 from Stanford. From 1973-75 he served as a clinical associate at the National Heart and Lung Institute and then completed a residency at UC San Francisco before returning to his alma mater as an associate professor in 1977.

Strober, who came to Stanford as an associate professor in 1978, has helped expand the benefits of total lymphoid irradiation—a form of radiation treatment developed to treat cancer—to include help for arthritis sufferers and to control the immune system among transplant patients.

He received his M.D. from Harvard in 1966. He completed his residency at Stanford in 1971. Since 1978, Strober is chief of the Division of Immunology.

The associate professor of pediatrics reappointed to tenure is Iris Litt, a specialist in adolescent medicine.

Litt's major research interest includes assessing teenagers' abilities to be responsible for their own care, establishing that autonomy and sexual maturity are accurate predictors of adolescent compliance with medical regimens, especially contraception. She originated the division of adolescent medicine at Stanford.

William Brody

Samuel Strober

Iris Litt

Vincent Hentz

Chong-Hong Hu

Lawrence Rinsky

Frank Sarnquist

A 1965 M.D. graduate of the State University of New York, Brooklyn, Litt came to Stanford in 1976 from Albert Einstein College of Medicine in New York. She became an associate professor without tenure in 1976.

The four new associate professors appointed are:

• Dr. Vincent R. Hentz, surgery; a 1968 graduate of the University of Florida College of Medicine, Hentz currently serves as chief of plastic surgery at the VA Medical Center. His primary research interests are anatomy of the upper limb and its surgical reconstruction, as well as peripheral nerve regeneration and repair.

Hentz served his residency at Stanford in 1968-74, and was an instructor in surgery at Columbia University College of Physicians and Surgeons in New York before returning to Stanford in 1975.

• Dr. Chong-Hong Hu, clinical dermatology; a 1966 M.D. graduate of Taipei Medical College, Hu has served as chief of the dermatology service at the VA Medical Center since 1979. He came to Stanford from Case Western Reserve University School of Medicine in 1979. Recent work has concentrated on immuno-fluorescence as a diagnostic tool in connective tissue disease, and various aspects of dermatologic oncology.

• Dr. Lawrence Rinsky, clinical surgery; his current research includes electrical stimulation of experimental Legg Perthes Disease in rabbits, bone tissue blood flow in experimental osteomyelitis, and a review of the benefits of the surgical treatment of scoliosis patients.

He is assistant chief of orthopaedic and rehabilitation services at Children's Hospital at Stanford. A 1971 graduate of the University of Cincinnati, Rinsky came to Stanford as a resident in 1972..

• Dr. Frank Sarnquist, clinical anesthesia, is assistant chief of anesthesia and director of the Palo Alto Analgesic Research at the VA Medical Center. Recent research has focused on the relationship between blood chemistry, exertion and high altitude. Sarnquist conducted field studies as a member of the 1981 American Medical Research Expedition to Mt. Everest.

Sarnquist received his M.D. from UC San Francisco, where he also served his residency. He came to Stanford as an assistant professor in 1976.

In other action at their September meeting, the trustees—meeting as the governing body of the Hospital—formally agreed to consolidate the pediatrics programs of SUH and Children's Hospital at Stanford.

The agreement provides for constructing as part of the Hospital Modernization Plan a new $40 million in- and outpatient facility combining all services now provided by the two separate hospitals.

Lawsuit settlement reached for quadriplegic child

Stanford University Hospital agreed Thursday, Sept. 16, to settlement of a lawsuit filed on behalf of an infant born in the facility's delivery room April 7, 1980.

The settlement calls for lifetime support for Anna Younger, a spastic quadriplegic who according to the plaintiffs "sustained severe and permanent brain damage" because she stopped breathing for some minutes in the first hour after birth.

Named as defendants are SUH, Dr. Joseph R. Hopkins, and Mid-Peninsula Health Services, Inc., a member-owned health care organization where Hopkins practices family medicine and serves as medical director. The defendants have denied allegations of negligence. No personnel at SUH were identified by name in the suit.

The agreement, ratified by Santa Clara County Superior Court Judge Edward Panelli, calls for an annuity to be established for support of the child, who most recently lives in a Santa Clara County foster home under voluntary arrangements of her parents.

The suit was filed by Anna's mother, Jocelyn Cunningham, 34, an accountant. She and her husband, Charles Younger, 37, a computer programmer, were Los Altos residents at the time of their daughter's birth.

Support payments for the child are to start Oct. 1 at $81,960—and increase according to a predetermined formula annually. By the year 2002, the child will be receiving more than $275,000 per year, according to the complex formula.

SUH and its malpractice insurer are responsible for funding the annuity during the life of the child, estimated by medical testimony and actuarial data to be 76 more years.

Thaddeus John Whalen, professor of economics at the University of Santa Clara, stated in a declaration filed by the plaintiffs that the present cash value of the settlement—taking into account tax advantages and other economic parameters—was at least $8.1 million.

In addition to personal damages for the child, SUH was to split a $1.2 million payment with Hopkins and Mid-Peninsula. Of this figure, about $200,000 is to be used for the child's current medical expenses, $150,000 was earmarked as personal and economic damages for each of her parents, with the remainder of the money going for plaintiff attorneys fees, court costs and related contingencies.

A review of the Delivery Room records filed as an exhibit with the court by Dr. L.L. Trigiano stated that a pediatric resident had examined the child moments after birth and "concluding she (the infant) was normal, returned her to her mother's arms." Trigiano, a San Francisco physician, had been asked by the plaintiff's attorney to review medical records and examine the child.

". . .At approximately one hour of age in response to a remark from the father of the child as to whether the child was living, the nurse in the Delivery Room called attention to Dr. Hopkins, the obstetrician (family medicine specialist), that the child was found to be flacid with no respirations and no detectable apical (heart) pulse.

"Cardiopulmonary respiration was begun immediately with an urgent call to the neonatal intensive care nursery for return of the staff with subsequent full resuscitative measures to the infant."

The baby was transferred to the intensive care nursery, Trigiano's review said, where a CAT scan indicated oxygen deficit and death of brain tissue. The child was discharged a week later but continued to receive frequent medical care at a variety of institutions.

Trigiano, who examined Anna on July 12, predicted she will require constant custodial care for the rest of her life.

Robert Cutler

Cutler appointed associate dean

Dr. Robert W.P. Cutler, professor of neurology, has been named to the newly-created position of associate dean of medical education, announced Dominick P. Purpura, dean of the Medical School.

"Dr. Cutler, a distinguished medical scientist and respected clinical neurologist, is ideally suited to serve in this pivotal position, helping to formulate and monitor medical education priorities here at Stanford," Purpura said.

In his new post, Cutler will be responsible for ensuring that courses and the curriculum maintain a consistently high standard and are appropriate to the aim of helping guide students towards their goal of becoming new members of the academic medicine community, Purpura said.

Cutler, currently chairman of the committee on courses and curriculum of the Medical School's faculty senate, came to Stanford in 1974 from the University of Chicago Pritzker School of Medicine. A graduate of Harvard University Medical School, he has studied the relationship between amino acids and the nervous system. His new appointment is effective immediately.

Purpura added that he was "particularly pleased that the University has accepted my recommendation that this position be created in recognition of the central importance of teaching and the curriculum."

Purpura forms special group to help shape academic policy

The Medical School's faculty senate recommends that a kidney transplant program be started.

But no money is available, so the proposal is never implemented.

This example is hypothetical but realistic, said Dean Dominick Purpura, who sought and achieved an Academic Policy Coordinating Council for the Medical School.

The 13-member APCC, which held its first meeting Aug. 2, is intended to help translate Faculty Senate and the Dean's Executive Committee recommendations into substantive policy based on the availability of space and money, Purpura said.

The group is also expected to aid the dean in researching faculty and student affairs issues, major academic programs and long-range planning, he added.

"We need to bridge the gap between seminal thinking needed to spawn innovative ideas and the practicality needed to implement them," Purpura said.

Subgroups

Two permanent subcommittees have been incorporated in the APCC, including a Budget Review Subcommittee. This committee previously reported directly to the Executive Committee. Dr. David Korn, chairman of the Department of Pathology, will continue as chairman.

Newly formed was a Space Subcommittee to help in allocating space for programs discussed by the APCC. This group will be chaired by Dr. Hal Holman, professor of medicine.

In addition, five special subcommittees were appointed to deal with specific issues:

• A Department Review/Visiting Committee is to develop criteria for reviewing the quality of departments. Membership includes Drs. John Collins, chairman of the Department of Surgery; Eric Shooter, professor of neurobiology; and John Wilson, associate dean for faculty affairs and professor of surgery. The subcommittee's first task will be to develop procedures for implementing department reviews, Purpura said.

• A Student Financial Aid Subcommittee will be expected to advise the Budget Subcommittee on student matters. Drs. John Steward, associate dean for student affairs, and Merton Bernfield, professor of pediatrics, were appointed.

• Korn, David Mendelow, associate dean for administration, and Dr. James A. Spudich, professor of structural biology, were named to a subcommittee to advise the dean on issues pertaining to specific matters involving the operating budget of the Medical School.

• A Teaching Affliliations Subcommittee would monitor clerkship and residency programs at outlying institutions. Appointed were Drs. Robert Cutler, professor of neurology and newly appointed associate dean of medical education; and Kenneth Melmon, chairman of the Department of Medicine.

• A group, chaired by Purpura, will define the conceptual thrusts of a new Interdepartmental Program in Molecular and Genetic Medicine, which will comprise a Science Center. Other members include Drs. Paul Berg, professor of biochemistry; Stanley Cohen, professor of genetics; Dale Kaiser, chairman of the Biochemistry Department; Korn; Melmon; Irving Schulman, chairman of the Pediatrics Department; and Shooter.

Meetings of the APCC will be held twice monthly. Members include all committee members listed above, who will serve for two-year, renewable terms.

Robert Zollinger

Zollinger to give Kovitz lecture

Dr. Robert M. Zollinger, emeritus professor and chairman of surgery at the Ohio State University College of Medicine, will present the eleventh Louis and Dorothy Kovitz visiting professorship lecture at Stanford School of Medicine Friday, Sept. 24.

Zollinger will speak from 5:30 till 6:30 p.m. in Fairchild Auditorium. His topic will be "Islet Cell Tumors and GI Hormones." The lecture is open to the public.

Zollinger will also present the surgical grand rounds on Saturday, Sept. 25. He will discuss "Reflections on Gastric Surgery" at 8 a.m. in room M106. This talk will be geared towards medical and health professionals, and medical students.

Zollinger is former president of the American College of Surgeons and the American Surgical Association.

Prior to joining Ohio State's department of surgery in 1946, he served on the faculties of Peter Bent Brigham Hospital and Harvard Medical School. He received his M.D. degree from Ohio State.

The Kovitz lectureship was established in 1969 by Dr. and Mrs. Kovitz of Los Altos to bring outstanding lecturers in medical and surgical fields to the Medical Center. Dr. Kovitz died in 1979.

Clinics welcome Tower's arrival

Donald Tower

Donald B. Tower is the new executive director of the Faculty Practice Program and the Stanford University Clinics, effective Sept. 13.

His position includes reponsibility for administrative affairs, business operations, policy development, and financial planning for the FPP in close liaison with the FPP's executive committee and the vice president for medical affairs.

Tower comes to Stanford from Columbia, Mo., where he served as administrator of the University Physicians, a practice group.

Tower can be reached temporarily in room M121, and his phone number is 497-6441. Eventually he will be moved to a new location, to be announced at a later date.

Course to teach preteens about their changing bodies

Puberty can be a bewildering and traumatic time for children who don't understand what is happening to their bodies.

To ease the transition into adulthood, Dr. Paula Maguire Duke, assistant professor of pediatrics at Stanford, is offering puberty education to boys and girls, ages 10-12, and their parents.

Often, puberty education isn't offered until children are already experiencing puberty, Duke said. "By that time, it's too late. Children need information about the changes that are going to happen before they happen. Unlike most other things, puberty is a very individual process. If children don't know what to expect, it can make them feel like 'outsiders' compared with their peers.

"What we really need to stress is that there is a very wide range of normalcy," she said.

Educating children early, Duke said, may help to avoid negative body images that often accompany their developing sexuality.

For example, 1981 studies in a high socioeconomic area showed 65 percent of 12-year-old girls wanted to be thinner, and 73 percent of boys wanted to be more muscular. But, there are physiological reasons that pre-pubertal boys cannot develop large muscles, and that pubertal girls experience weight gain and increase in body tissue, Duke said.

The course series, which will not include any discussion of moral values, each consist of two hour-long sessions at Children's Hospital at Stanford. The first series is scheduled for Oct. 27 and Nov. 3. The second is scheduled for Nov. 9 and 16.

Parents are included, Duke said, because studies have indicated that up to 70 percent of children in that age group want to hear this type of information from their parents. Many parents forget what puberty was like, Duke said, and are uncomfortable or unsure of how to approach and discuss the topic.

The first session, for everyone together, will include discussion of the physical changes and development of secondary sex characteristics. The second session will provide more detailed information, with separate groups for boys, girls, and parents.

Questionaires should help indicate if children feel more at ease with puberty as a result of the early education.

"Our goal is to change the way children deal with puberty by intervening at an early age," Duke said. "If children and parents start talking about these issues early enough, by the time they need to discuss interactive sex they will feel more comfortable."

Duke has been researching puberty education for about five years. She was instrumental in incorporating sex education in Palo Alto Unified School District's seventh grade curriculum.

For further information 'or course registration, call 327-4800, extension 538.

—Shirley Kraus

New class count

In the Sept. 8 issue of the *Medical Center Memo*, we reported that there are 91 incoming students at the Medical School this fall.

Updated information from the Office of Student Affairs brings the actual final count to 86 new students.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

A breath of fresh air. . .

Activity-filled week greets non-smoking policy

This week marks the official "kick off" of the Hospital's new non-smoking policy, passed by both the Medical and Hospital Boards.

Activities throughout the week are designed to introduce patients, faculty, staff, students, and visitors to the present regulations, which clearly delineate smoking from non-smoking areas.

A poster campaign has begun, in hopes of encouraging smokers to quit. A series of quit smoking classes for Medical Center employees, sponsored by the University's health improvement program (HIP), will begin Oct. 4. Smoking and non-smoking signs have been posted, and patient information is being distributed by Patient Admitting Services and via meal trays.

A letter has been mailed to all employees from executive director and vice president Sheldon King, along with "non-smoking cards" which employees may hand to persons smoking outside a designated smoking area. (More cards, as well as "non-smoking buttons," are available from the Department of Community Relations.)

For a couple of days this week, a booth has been installed between the cafeteria and the patient admitting area to distribute informational materials, balloons, buttons, cards, and other items, and to provide sign-up sheets for exercise and quit smoking programs.

Those lunching in the cafeteria have been treated to a clown performance in honor of the non-smoking campaign.

The general guidelines of the Hospital's new non-smoking policy follow:

- In public areas of the Hospital, including waiting rooms, cafeterias, public hallways and lobbies, smoking is not permitted except in specially designated smoking areas.
- Where smoking is not permitted, conspicuous signs stating this fact shall be posted in both English and Spanish or by a generally recognized no-smoking symbol.
- Smoking is not permitted in any Hospital elevator, escalator, or stairwell.
- Smoking is prohibited in any area of the Hospital where flammable liquid or gases or oxygen are in use or stored.
- Visitors are not permitted to smoke in patient rooms at any time. For patients, smoking is permitted only in specially designated areas. The exception to this rule is a patient in a private room unable to go to a designated smoking area. Such a patient may smoke in the private room only on the written order of a physician.
- If an unsafe situation exists (for example, a patient is affected by medication), smoking materials may be removed.
- Employees, physicians, and students are not permitted to smoke in patient rooms at any time. No smoking is recommended in meeting rooms and classrooms.

Dr. James Silverman, chief of staff, has stressed the importance of the physicians' role in implementing the new policy. "The concept of non-smoking needs repeatedly to be emphasized because of the disastrous health consequences which come with the habit," he said.

Nursing staff, as well, have been provided with guidelines for their part in the non-smoking implementation.

The non-smoking campaign grew out of concern expressed to the Department of Community Relations by patients and their families, according to director Jeanne Kennedy. At that point, an advisory committee for patient relations was established with representatives from Nursing, community physicians, faculty, Social Services, and Admitting.

That committee, reporting to Kennedy, made policy recommendations on the areas of patient television viewing and visiting hours, as well as smoking. Evaluation of the new non-smoking policy and its implementation is hoped to be completed by December.

For further information regarding this week's activities, or the non-smoking campaign in general, call Community Relations at 497-7167. For further information regarding the quit smoking classes, call 497-7940.

Medical Center Calendar

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservation required. Call 497-6389.

PUBLIC EVENTS

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

WEDNESDAY, SEPTEMBER 22

Basic Science Research Colloquium: "A DNA Primase from *Drosophila melanogaster*"—Dr. I.R. Lehman. 5 p.m., Fairchild Auditorium.

Nursing Educational Services: "Basic EKG Interpretation Workshop—Junctional and Ventricular Dysrhythmias." Limited to 20. Fee required. Continuing education credit available. 7 till 9 p.m., W005. For further information, call 497-6366.

Div. of Hematology: "Gamma Globulin Therapy"—Dr. Richard Schwartz. (Cutter Labs), noon, S102.

Dept. of Pathology: "Biochemical and Genetic Studies of Mammalian DNA Synthesis: Recent Results on Thymidylate Synthase and DNA Polymerase with Primase Activity"—Dr. Takeshi Seno (Saitama Cancer Ctr. Research Institute, Japan). Noon, L201.

THURSDAY, SEPTEMBER 23

Dept. of Medicine Grand Rounds: "A Genetic Defect in Vitamin D Resistant Rickets"—Dr. David Feldman. 8:30 a.m., Fairchild Auditorium.

Nursing Educational Services: " 'Burnout'—Treatment and Preventions." Continuing education credit available. Fee required. 8:30 a.m. till 3:30 p.m. 701 Welch Rd., #327. For further information, call 497-6366.

La Raza Staff Association: Annual Wine and Cheese Reception. Plan to join other staff, faculty and administrators from the University, Medical Center and SLAC. 4:30 till 6:30 p.m., Faculty Club. For further information, call Margarita Ibarra at 497-0791.

FRIDAY, SEPTEMBER 24

Dept. of Gynecology and Obstetrics Grand Rounds: "Hepatic Rupture as a Complication of Mild Pre-eclampsia"—Drs. Harise Stein and Kent Ueland. 8 a.m., A336.

National Kidney Foundation of Northern California: "Advances in Organ Transplantation." Continuing education credit available. Registration begins 7:45 a.m., reception 5 p.m., Fairchild Auditorium. For further information, call 697-0110.

Dept. of Surgery—Kovitz Lecture: "Islet Cell Tumors and GI Hormones"—Dr. Robert Zollinger (Ohio State Univ.). 5:30 p.m., Fairchild Auditorium.

Dept. of Pediatrics Grand Rounds: "Ambiguous Genitalia"—Drs. Ron Rosenfeld and Jose Enz. 8 a.m., M106.

SATURDAY, SEPTEMBER 25

Dept. of Surgery Grand Rounds: "Reflections on Gastric Surgery"—Dr. Robert Zollinger (Ohio State Univ.). 8 a.m., M106.

MONDAY, SEPTEMBER 27

Div. of Otolaryngology/Head and Neck Surgery—Resident Lecture Series: "Sound Perception by Normal Ears"—Earl D. Schubert, Ph.D. 7:30 a.m., R117.

WEDNESDAY, SEPTEMBER 29

Nursing Educational Services: "Basic EKG Interpretation Workshop—Heart Blocks and Pacemakers." Enrollment limited to 20. Fee required. Continuing education credit available. 7 till 9 p.m., W005. For further information, call 497-6366.

FRIDAY, OCTOBER 1

Arthritis Self-Management Classes Begin. Sponsored by the Stanford Arthritis Center. Offered at 12 locations in the Bay and Peninsula Area. Sessions run for six weeks. Pre-registration necessary. Fee required, scholarships available. For further information and applications, call 497-7935.

TUESDAY, OCTOBER 5

Dept. of Dietetics: "Recent Advances in Nutritional Care," a symposium of current practices. 8 a.m. till 1 p.m., auditorium of Children's Hospital at Stanford. For further information, call Jane Woeckener, R.D., at 497-6904.

WEDNESDAY, OCTOBER 6

Nursing Educational Services: "Basic EKG Interpretation Workshop." Enrollment limited to 20. Fee required. Continuing education credit available. 7 till 9 p.m., W005. For further information, call 497-6366.

Calendar items must be received in the Office of Public Events, 800 Welch Road, Suite 221, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Patient care issues face review by new quality assurance committee

The Medical Board approved at its last meeting the formation of an executive quality assurance committee.

The new seven-member panel of the Medical Board is expected to meet at least every other month and will review patient care issues throughout the Hospital, including those "which cannot be effectively handled within a standing committee of the Hospital or Medical Board."

Generally, the committee is charged with "ensuring that patient care evaluation activities throughout the Hospital are ongoing, appropriate, comprehensive, and effective in maintaining and improving the quality of patient care."

The measure was presented to the Board by Carole Price, associate Hospital director, and Karen Axnick, associate director of Care Review/Risk Management. Formation of the new committee will now be sent to the Hospital Board for its approval.

The committee is to be composed of the chief of staff, president of the medical staff, chairman of the care review committee, two members of the Medical Board, the director of the Hospital (or his designee), the director of Care Review/Risk Management, and the director of Nursing.

Other members of the medical staff are to be added as needed for particular issues.

...News Notes...News Notes...News Notes...

Donald Harrison

Dr. Donald Harrison, professor and chairman of Cardiology and president of the American Heart Association, will speak on "Newer Experimental Antiarrhythmic Drugs" at the 52nd annual Physicians' Postgraduate Symposium on Cardiovascular Diseases.

The program will explore four major topics: cardiovascular and pulmonary emergencies, ischemic heart disease, cardiovascular therapeutics, and treatment of acute myocardial infarction.

It is scheduled for Oct 7-8 at the San Franciscan Hotel, 1231 Market St. in San Francisco. Harrison will speak at 2 p.m. Thurs., Oct. 7.

* * * *

Drs. William Dement, professor of psychiatry and behavioral science, Avram Goldstein, professor of pharmacology, and Dominick Purpura, dean of the Medical School, are among 49 new members recently elected to the Institute of Medicine of the National Academy of Sciences.

* * * *

SUH is among 23 hospitals in eights states which completed gathering data by the end of August on the frequency and cost for all lab and X-ray tests ordered in its emergency department, announced Dr. Michael Eliastam, director of Emergency Services and assistant dean for clinical affairs.

Three months of data collection is to be analyzed, and then about 40 high-cost, high frequency tests will be targeted for cost containment, said Eliastam.

The study is being conducted by the Dallas-based American College of Emergency Physicians, in hopes of developing lower-cost alternatives to diagnostic tests currently used.

One premise of the study has been to determine if the routine ordering of certain diagnostic tests should be questioned more closely.

* * * *

Grace Neal has been appointed to the position of clinical nursing coordinator (CNC), Support Services, announced Claire Mailhot, R.N., M.S., director of Operating Room (OR) Services and assistant director of Nursing Services.

Neal's responsibilities will include system development for the instrument room and sterile room, and inventory control and planning for the Hospital Modernization Project.

Neal has been an OR nurse at Stanford since 1964. She has functioned in both the clinical services and administration. Most recently she served as assistant CNC for Ophthalmology/Plastic Services.

John Farquhar

Dr. John Farquhar, director of the Stanford Heart Disease Prevention Program and professor of medicine, has been awarded the James D. Bruce Memorial Award for distinguished contributions in preventive medicine.

The award has been given yearly since 1948 by the American College of Physicians.

* * * *

Linda Slezak has been appointed to the position of CNC, Operations, announced Claire Mailhot, R.N., M.S., director of OR Services and assistant director of Nursing Services.

Slezak's responsibilities will include OR scheduling, coordination of front desk activities, auxiliary staff, and the OR's relationship with other departments.

Slezak has been with the Stanford OR region intermittently since 1966. She has held various staff and management positions, coordinating the first preceptor program in the OR. She served as assistant CNC, scheduling coordinator, since Jan., 1981.

* * * *

Duane Walker, R.N., M.S., director of Nursing Services, has announced the following appointments in his department:

Joyce Miller, R.N., M.N., has been named associate director of Nursing responsible for the adult critical care region, surgical region, Operating Room, P.A.R., A.S.T.U., and nurse recruitment. Miller has been at Stanford for three and a half years as assistant director of adult critical care. She has now relocated to the main Nursing office, room C020-B. Her phone number is 497-6496.

Jean Bronstein, R.N., M.S., has been appointed assistant director of Nursing for adult critical care. Bronstein has been the assistant director at Hoover Pavilion for the past four years.

Nancy Gear, R.N., M.S., has been appointed assistant director of Nursing for Hoover Pavilion. Gear has been the CNC of West 3B for the past four years.

Mary Lou Murphy, R.N., M.S., has been appointed assistant director of Nursing for the surgical region. Murphy has been at Stanford for eight years. She served as acting assistant director of Nursing for the surgical region for the past three months.

These appointments reflect replacement of vacant positions in the department due to internal transfers and were made within the allocated budgeted positions of the department, said Walker.

* * * *

The Mid-Peninsula Health Fair, to be held at the Stanford Shopping Center Sept. 25 and 26, will feature several Medical Center department displays along with a variety of area health programs.

The Operating Room will display various instruments, sutures, prostheses, and implants. Staff will be on hand to answer visitors' questions. Brook Odobas and Gerry Schulman, both R.N.s in the OR, helped to coordinate the health fair.

The Department of Dietetics will target their presentations towards both adults and children. For the latter there will be Walt Disney educational programs, filmstrips, recipes, and quiz sheets. The adult portion will concentrate on weight control. There will be available scales, charts, and evaluations of nutritional fads.

Other SUMC groups participating in the fair include Hospital Personnel, Pediatrics, and Friends of Nursing.

* * * *

Pat Cook has been appointed assistant manager of the Human Resources Group, announced manager Rosemary Hornby.

Cook has been on the group's staff for five years. The expansion of her responsibilities will make her accountable for the daily operation of all aspects of the human resources program in the Medical School.

Cook will continue to work closely with Hornby in policy development and implementation as well as employee relations. The new arrangement is hoped to provide departments with a more effective response from the office, while allowing Hornby more time to develop and implement new activities.

Also, announced Hornby, two new regular staff members joined the group over the summer, replacing Gail Selke and Emily Chow. Sue Skelton was appointed manager of the office. Having been a teacher and most recently a consultant in the Santa Clara school district, Skelton is now developing her skills in computer programming and training.

Catherine White will be personnel assistant to Anna Garcia And Dorothy Thompson. She will coordinate the processing of all personnel forms and work directly with departments in resolving employment and other personnel actions. White is a recent graduate of Cal State in San Luis Obispo.

* * * *

Karen Richards, R.N., M.A., is leaving her position at SUH as assistant director of Nursing for marketing and recruitment, to become director of Personal Shopping Services at Neiman-Marcus, an exotic fashion specialty store.

Karen Richards

Richards, at SUH since 1969, has done freelance shopping consulting part-time.

"I've had a wonderful career at Stanford," she said, "and it was difficult to decide to leave. I wouldn't want to work in nursing administration anywhere else."

Richards started at SUH in the perinatal area, where she specialized in labor and delivery. She became the nurse consultant for Hospital computing services, and then the first coordinator of Concurrent Review. Under Peter Levin, she was special assistant to the executive director from 1977 until 1981.

Richard's last day at SUH will be Sept. 24.

* * * *

Alice Morrow, R.N., M.S.N., has resigned her position as CNC of Pediatrics effective Sept. 10, announced Judy Lanigan, R.N., assistant director of Nursing for medical pediatrics.

Morrow is returning to Texas and has accepted a position as nursing supervisor of a 24-bed pediatric intensive care unit at Children's Medical Center in Dallas.

Dorothy Holmes, R.N., B.S.N., assistant clinical nursing coordinator of Pediatrics, has agreed to serve as acting CNC during the interim period.

Wanted: Research Volunteers

Healthy volunteers are needed to serve in control groups for diabetes research being conducted by Dr. Gerald Reaven and associates at Stanford University's clinical research center.

To be eligible, volunteers must be between 30 and 70 years of age, male or female, and without diabetes.

Participants will be offered the following free of charge: an evaluation of blood sugar, insulin and cholesterol; routine health evaluation including liver and kidney function test, blood chemistry, cardiogram and physical exam; and meals during the entire study period.

Anyone wishing further information about the ongoing studies should call Clarie Hollenbeck, Ph.D., or George Liu, M.D., between 9 a.m. and 5 p.m., at 497-6973.

Editor's note: The Medical Center Memo *is happy to help publicize the need for volunteers in research efforts throughout the Medical Center, when appropriate. Contact Lisa Ames, at 7-6911, or send materials to Medical News Bureau, TC-135.*

Happy listening!

CBS radio's "Frontiers in Medicine" series next weekend will feature several Stanford faculty members interviewed by science reporter Charles Crawford.

For those interested in tuning in, the air times and topics will be:

- 9:40 a.m., Sat., Sept. 25: SUMEX. Speakers are Dr. Edward Shortliffe, assistant professor of medicine, and Thomas Rindfleisch, director of SUMEX.
- 6:40 p.m., Sat., Sept. 25: genetic engineering. The speaker is Dr. Jeffrey Sklar, assistant professor of pathology.

Also, Dr. Donald Harrison, professor and chairman of Cardiology, will be included in no. 15 of the 20-part series, time tentatively set for 1:40 p.m., Sun., Sept. 26.

KCBS is at 740 on the AM dial.

Access issue separate from modernization, says Crowley

Recently, Vice President for Medical Affairs Lawrence G. Crowley, M.D., published an article in the Peninsula Times Tribune *concerning the importance of Stanford University Hospital's modernization plans, and the issues surrounding the access of community physicians to the Hospital's clinical-based services and laboratories. Because of space limitations, some points were omitted in the* Times Tribune *version. Following is the complete text:*

Stanford University Hospital's urgently needed modernization project has recently been obscured by fiction and political maneuvering over how much access community doctors should have in the Hospital's specialized services and laboratories. In order to comprehend exactly what is at stake, here is a clarification of what is fiction and what is fact:

• **Some say Stanford needs to modernize its hospital solely to meet its medical school's academic needs.**

FACT: The modernization is essential because the buildings are obsolete. The Hospital must be modernized to meet new state and federal codes, and to accommodate new technology to meet the future needs of patients, physicians, and the Medical School's educational programs. If modernization is to be aborted, for any reason, community and faculty physicians will suffer equally. The biggest losers, however, will be the citizens.

• **Some say Stanford wants the Hospital solely for its own needs. It doesn't want community physicians to practice there.**

FACT: The Hospital's medical staff policy is the most liberal of any teaching hospital in the nation. About 600 community physicians are members of the medical staff and admit patients to the Hospital. Even more, the Hospital's policy provides controlled access to community physicians in many Hospital-based clinical services and laboratories. By contrast, a recent survey shows that all other major Peninsula hospitals have completely closed or extremely limited access arrangements for the same specialized services.

Hospitals limit access to control cost—to the hospital and to the community—by limiting the number of expensive pieces of equipment, and professional and support personnel, to those necessary to provide medical services to all patients. Limited access also ensures high quality care to all patients, and maximum efficiency by allowing administrators to work with a single organized group of physicians.

Most importantly, patient care and education by highly qualified, well-organized and motivated faculty aids the teaching and training of tomorrow's physicians and conduct of clinical research. By limiting access to these services, Stanford is attempting to meet faculty and community physicians' needs, without sacrificing cost control and quality of care.

Lawrence Crowley

• **Some say Stanford wants limited access to the laboratories because if faculty doctors perform the tests, the professional fees go to Stanford.**

FACT: The professional fees do in fact go to Stanford—to support the Medical School's educational programs. Faculty physicians receive salaries that are modest compared to what their colleagues earn in private practice. The faculty contributes not only part of its income to the general welfare of the Medical Center, but also expensive equipment available to all patients. And Stanford assumes all the financial risks for the $125-million modernization project. Neither Palo Alto nor the community physicians have any financial liability.

• **Some say lack of access to the Hospital-based clinical services means that community patients cannot benefit from the special procedures available.**

FACT: The Hospital-based clinical services and laboratories are available to ALL patients upon order of their physician. The procedures are simply done either by faculty or by community physicians who have staff privileges in these services.

• **Some say if community doctors do not gain unlimited access to the hospital-based clinical services, all private practice in Palo Alto will vanish, forcing citizens to use only faculty physicians.**

FACT: As a medical school, Stanford has a specific mission—training doctors and advancing medical knowledge. In addition to providing care of the highest quality, it must ensure that its graduates develop the clinical expertise enabling them to practice anywhere, not just in Palo Alto. While many of Stanford's medical graduates go all over the country to set up their professional practices, many physicians are attracted to Palo Alto because of the intellectual stimulation and quality of life here.

Despite more restrictive access policies to the Hospital-based clinical services prior to August 1981, private practice has thrived in Palo Alto. There is a high concentration of physicians per population; this will continue to be the case. Stanford University Hospital cannot accommodate all these physicians in its specialized services. No hospital can.

• **Some say not enough progress has been made on the four-year-old access issue.**

FACT: About one year ago, the Board of Hospital Directors, following the recommendations of a faculty-community physicians committee, expanded the access guidelines to include those who already were members of the medical staff, those who were on the voluntary clinical faculty, those qualifying as courtesy physicians under the Palo Alto-Stanford contract, and those who affiliate with the School of Medicine to teach and do research under full-time faculty supervision.

In June 1982 the Board adopted a set of policies governing utilization of its facilities that were widely supported by the medical community. Also, the Board has appointed a permanent community/faculty physicians access committee to develop future policies.

Stanford is continuously concerned and is making an effort to achieve as much as possible its own essential needs as well as those of community physicians and Palo Altans. The access issue, however, is not a political issue. And there are dangers in making it one. The sooner it is taken off the hot seat, the sooner the community will be able to benefit from a state-of-the-art hospital with adequate facilities and space. The best way outstanding access issues can be resolved is by discussion and agreement among professionals. This ongoing process should continue, because community physicians have been and will continue to be part of the collaborative relationship that has characterized the Stanford University Medical Center.

Attempts to disrupt the process through legislative end-run initiatives, and attempts to coerce or extort a settlement at any price, however, will simply destroy the goodwill that has made progress thus far possible.

Center will permit distinguished scholars to focus on policy questions

continued from page 1

more deeply and more distantly from the policy process," Rosse said in a campus interview.

"We can bring to bear powerful methodologies which we have developed over the last 20 years at a reasonably fundamental level.

"Stanford is already very well known in economics for its theory and methodology, with such outstanding names as Nobel Laureate Kenneth Arrow and Mordecai Kurz, Theodore Anderson and Takeshi Ameniya, and a good many others. We see CEPR as a means of bringing that methodology to focus more closely on policy issues.

"Many of us are already engaged in major policy issues. Michael Boskin, for example, has been very active in the federal budget process where he worked with the Senate Committee on the Budget. He has also been active in social security policy. I am busy in regulation and anti-trust matters.

"John Pencavel is an expert on labor, pension and compensation matters. John Shoven is an authority on the tax system. James Sweeney is well known for his work in energy. Paul David has a leading reputation in science policy matters.

"How do we operate? We depend almost entirely on grants from private foundations and individuals. Most of the funds we receive are unrestricted, in the sense that we can use them for any project we feel is appropriate.

"The Steering Committee encourages faculty to present proposals to us, we analyze them to see if they fit our research objectives, and if they do we fund them.

"Most fall into one of two categories. The first are those which yield one or two papers. An example of this is a study done by Timothy Bresnahan on the impact of proposed emissions rollbacks on the automobile industry. John Pencavel is doing one on labor unions and productivity.

"We are in the process of developing several much larger projects. For example, John Shoven has proposed a general study of the tax system. This would be a major project, and we are trying to arrange for its funding."

Independent laboratory

The Center will have the status of an independent laboratory and will report to Vice Provost Gerald J. Lieberman. The staff is now moving into refurbished offices in Encina Commons.

Rosse pointed out that economics flourishes not only in the Economics Department, but also in many other parts of the University. "Important work is going on in Engineering-Economic Systems, the Graduate School of Business, the Medical School, the Schools of Law and Education, the Food Research Institute, Hoover Institution and elsewhere."

The Center will serve to integrate some of the more policy relevant parts of this work.

The Associates Committee now has 18 members, most of them business leaders in the community who make annual pledges of support. The Center has received a grant from the Koret Foundation to sponsor some of the conferences that will be held during the next five years.

Rosse paid great tribute to Boskin, the most important investigator of the idea of creating the center. "He has also played a leading part in setting research policy and in fund-raising activities," Rosse said.

"An important reason for the success of CEPR and my optimism about it is the Advisory Board, which is headed by Edmund Littlefield, and every member is a notable."

Among the associates, Herb Dwight is president of Spectraphysics, while Reid Dennis, Tom Ford, Pitch Johnson and Frank Lodato are venture capitalists.

Paul David, who headed the committee that brought CEPR into existence, said that the field of economics is moving in new directions.

"This is caused by worrying signs of retarded growth and persisting underutilization of productive resources in the economy, combined with a lingering threat that rapid inflation will resume.

"A number of younger economists are now focusing on applied research that can help to solve our economic problems. They are saying that the traditional methods of governmental intervention tinkering with this or that feature of the tax laws, deficit spending to prop up demand, wage and price guidelines to hold down inflation—have outlived their usefulness.

"Instead, what is needed is an effort to design longterm, consistent and predictable government policies to replace the 'quick fixes' of the past, many of which have only aggravated the problems they were meant to solve.

"A number of economists who take this approach are among the distinguished faculty at Stanford. To facilitate their research, and to mobilize their resources of the university community to take a fresh look at fundamental economic policy issues, CEPR has come into being."

Many widely-known policy centers, David point out, are located close to the "scene of action" in Washington, D.C. One result of this proximity has been research dominated by the short-term perspective of political propinquity.

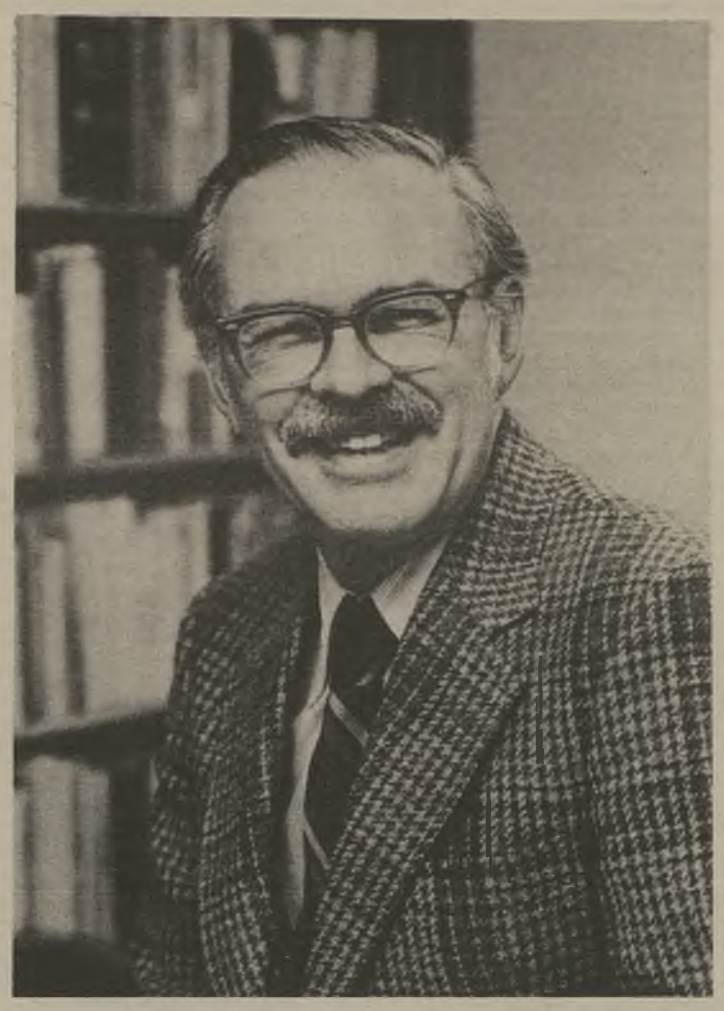
"CEPR provides a clear alternative, in that it sponsors sustained research by first-rate independent scholars, free to pursue the study of economic issues, that will be of enduring concern to the American people," David says.—**Donald Stokes**

Ted Good takes a look at how piano technology has affected musical history

Ted Good sat down at the piano to play a Brahms Sonata, and out came a book.

That's the way it is at Stanford, where intellectual ideas and concepts leap in every direction like a bolt of summer lightning. The fact that it took 10 years from the first notes to publication of *Giraffes, Black Dragons and Other Pianos* (Stanford University Press, $29.50) is unimportant.

What is important is that the education of Stanford students was enhanced, because the Brahms Sonata also led to an entirely new course in the Values, Technology and Society Program: VTS 165, "Technology and Musical Expression."



Edwin M. Good is a professor of religious studies, but that's another story.

More closely related is the fact that he also is a concert pianist and a member of the Manzanita Quartet. And that portion of his life gave him the idea, in the early 1970s, to expand his life by getting an M.A. degree in music—in his spare time. (He had to get special permission from the University administrators and faculty, but he solved that, too.)

"I was playing and studying the Brahms Sonata for Two Pianos for my M.A. project," said Good, "and I wondered what kind of piano would have been used by Brahms when he wrote in 1863.

"Soon after I completed my M.A. degree in 1974, I became chairman of the Values, Technology and Society program, and began thinking about what kind of course I might teach. The piano is a piece of technology, and I began thinking about the relationship between the technology that produces means of making musical sound, and the expressive ways composers have used those means in Western music since the 18th century.

"That led to the development of the course—and the book, which I believe is the only one covering pianos from early to electronic, using a technological point of view—the artisans who made them, their design, materials and manufacture, how they work, and the musicians who wrote for and played the piano." The major concept Good discovered in his research for the book, he says, is that "an innovation isn't adopted universally until a very long time has passed."

The piano is a piece of technology, and I began thinking about the relationship between the technology that produces means of making musical sound, and the expressive ways composers have used those means in Western music since the 18th century.

Pianos always were constructed of wood, because their makers were cabinetmakers. But they began to buckle and collapse because "the demand for more volume and range led to thicker strings, and the wooden frame couldn't stand up under the increased tension," says Good.

In 1825, Alpheus Babcock of Boston, "a superb craftsman and piano maker," patented a one-piece cast iron frame to hold the strings.

"But it wasn't until around 1910—68 years after Babcock's death—that everybody was using the iron frame," says Good. "Babcock never became rich. No one wanted to pay royalties, and other makers doubted that it was a good idea, worrying that a metal frame would distort the tone. The leadership of Steinway in the second half of the 19th century laid that idea away."

The Smithsonian Institution and the Metropolitan Museum of New York have the best early piano collections in America, says Good, and in the Smithsonian he found the only existing Babcock piano with the iron frame.

Pianos used by romantic composers such as Schumann, Schubert and Brahms, says Good, were "much different from today's instruments, in action, range and volume. Schumann's piano, now in the Kunsthistorisches Museum in Vienna, was all wood and had a very much smaller and cleaner sound than a modern grand. At Schumann's death, Clara Schumann gave the instrument to Brahms, who owned it until 1873.

"In my VTS course, I teach the correlation between an instrument and the music, pointing out that music is written with a specific sound in the composer's head. I demonstrate my thesis on the piano, and also play records for the students."

The piano was invented in Florence, about 1700, by Bartolemeo Cristofori. One he built in 1720, the earliest now in existence, is at the Met.

"What a conceptual leap it was when he invented the piano mechanism," says Good. "It was a completely new principle."

Cristofori left nothing in writing, but a 1711 article about him exists. "Eric Hutchinson (professor of chemistry) owns a copy of the original journal, in Italian, and I struggled to translate it, word by word," laughs Good.

The title of Good's book really does refer to pianos.

"'Giraffe' is the name for early 19th century German upright pianos, which were grand pianos standing on end," says Good. " 'Black dragon' is my personal term for any concert grand, because they're all painted black, a custom that began only in the late 19th century. Before that, they were veneered in beautiful walnut, cherry, and sometimes rosewood."

Good's own piano is one he just obtained—a Bluthner from East Germany.

He describes its tone as "marvelous." It is made of walnut.

There's still no effective civil defense against nuclear attack—Drell

There's still no effective defense against nuclear retaliation, a Stanford arms control expert testified in Washington Wednesday, Sept. 15.

Prof. Sidney Drell spoke on the consequences of nuclear war at a hearing called by the Subcommittee on Investigations and Oversight of the House Committee on Science and Technology.

Both America and the Soviet Union remain hostages to the threat of retaliation, he said. "I cannot conceive of a civil defense system that could protect either the Soviet or American society from unprecedented and unacceptable disaster and devastation in all-out nuclear war."

He took sharp issue with suggestions that the U.S. could recover from all-out nuclear war in two to four years, an assessment attributed to T.K. Jones, deputy undersecretary of defense for strategic and theater nuclear forces.

"The problem with all precise nuclear war scenarios, with their neat assumptions and predictions, is that we fortunately have no data," Drell said.

"In real wars—the nonnuclear conflicts of past experience—we have learned to appreciate that the course of events in determined by vitally important factors such as surprise, individual bravery, motivation, and luck. These do not appear in theoretical scenarios.

"The imaginary scenarios and computer printouts of casualty levels seem to proliferate only when there are neither data nor experience to test them against."

As Rebecca West once observed: "Before a war, military science seems like a real science, like astronomy; but after a war, it seems more like astrology."

The U.S. and the Soviets now have "vast arsenals of more than 50,000 nuclear weapons," Drell said. There is no technical basis for confidence that any nuclear conflict would remain limited:

"There are too many opportunities during conflict for confusion and error. Once the nuclear threshold is crossed, there will inevitably be broad delegation of authority down the line for nuclear release."

All the bombs and other munitions used in World War II totalled only six megatons—less than the megatonnage of a single large nuclear warhead, he said.

Hiroshima and Nagasaki were devastated by relatively small atomic bombs, whose yield was roughly 15 kilotons; the totals today exceed 10,000 megatons. Each megaton detonated on the earth's surface or at low altitude will typically make 1,000 square miles uninhabitable to unsheltered humans for several weeks or more.

A major nuclear exchange designed to kill civilians would result in a combined total of 200 million deaths in the U.S. and the Soviet Union. Tremendous fires in forests, croplands, and urban and industrial areas could reduce sunlight by a factor of 150.

Drell noted that six years ago Fred Ikle, now undersecretary of defense for policy, observed that "the aggressor country might suffer serious psychological, economic, and environmental effects even without a nuclear response by the country attacked."

In the early days of the hydrogen bomb, President Eisenhower observed that "we're rapidly getting to the point that no war can be won." Instead of battle to exhaustion and surrender, the outlook comes closer to "destruction of the enemy and suicide," he added.

Drell said that "since then, all we have done is to increase the level of potential devastation by many orders of magnitude, and the arsenals have grown to more than 50,000 nuclear weapons which, if they are unleashed will, obliterate our civilization, built over the centuries by the human spirit and human genius."

Board of Trustees report

Board of Trustees appoints several faculty, students to committees

The Board of Trustees took the following actions at its meeting on September 14, 1982:

1. Approved actions already taken by the Office of the Vice Provost and Dean of Graduate Studies and Research to enter into contracts and grants for research for the month of May, 1982, totalling $12,123,574; for the month of June, 1982, totalling $9,071,629; and for the month of July, 1982, totalling $22,374,533. The monthly average of such awards for the twelve-month period ending July 31, 1982, was $13,114,432 compared with $13,168,703 for the corresponding period the year before.

2. Accepted gifts received during the month of June, 1982, totalling $5,954,960; during the month of July, 1982, totalling $5,383,191; and during the month of August, 1982, totalling $6,302,641.

3. Appointed faculty and student members of its committees as follows:

Academic Affairs and Development: John Freccero, Theodore H. Geballe, Jerusha A. Stewart, Steven P. Westly, and Rod A. Beckstrom (ASSU Observer).

Finance and Administration: Robin A. Cooper, Richard H. Jahns, Susan Mensinger, Lyle M. Nelson, and R. Mark Epstein (ASSU Observer).

Investments: Craig Albright and James C. Van Horne.

Nominations: Eleanor E. Maccoby.

4. Welcomed Martin Anderson, Daniel L. Brenner, John A. Ditz, and Katharine Heard Hanson, elected to the Board by alumni this summer, to their first meeting.

5. Honored Trustee John W. Gardner upon his retirement from the Board after many years of distinguished service.

6. Approved actions taken earlier by officers of the Board regarding matters of estate.

7. Authorized the Vice President for Business and Finance to enter into a lease for the 5.092-acre parcel at 600 Hansen Way in the Stanford Research Park.

8. Authorized the Vice President for Business and Finance to negotiate within the guidelines listed below for the terms and conditions governing Stanford's participation in Palo Alto's Below-Market-Rate Housing Program:

a. The dedication of 15 percent of units at Stanford West to below-market-rate housing using pricing mechanism.

b. Of that 15 percent, a dedication of at least 60 units to Below-Market-Rate Housing Program participants designated by the City of Palo Alto.

c. A 35-year lease of the Mayfield-School site to the City of Palo Alto for $100,000 to allow it to develop below-market-rental housing. This development would revert to Stanford at the end of the lease.

9. Heard a report of the following actions taken between meetings:

a. That our target-asset-allocation mix should continue to be maintained; that Capital Guardian Trust Company be given the discretion to increase the amount in short- and medium-term maturities of U.S. Treasury securities; and that a limit of 15 percent of the portfolio was set with a maximum maturity of five years being reaffirmed.

b. That the Vice President for Business and Finance be authorized to invest up to $750,000 in the equity securities of Synapse Corporation and to sign, following legal review, any documents necessary to accomplish that investment.

c. That the Vice President for Business and Finance be authorized to invest $420,000 in the securities of Felsway Investors, Inc.

10. Heard a report on the staff pension plan managed by Prudential Insurance Company.

11. Discussed the fixed-income portion of our endowment investment pools with portfolio managers from Rosenberg Capital Management.

12. Approved the design for Phase I of the B. Gerald Cantor Sculpture Garden to be located adjacent to the Stanford Museum and approved the preliminary design for Phase II of the same project.

13. Heard a report of the following actions taken between meetings:

a. Approval of an increase of $57,000 in the total budget for the renovation of Cubberley Auditorium, from $625,000 to $682,000, to add air conditioning.

b. Approval of an increase of $292,000 in the total Memorial Church organ-installation budget, from $1,679,000 to $1,971,000, to enable the University to acquire an enhanced version of the organ.

c. Approval of an increase of $101,000 in the total budget for the relocation of Ventura Hall, from $724,000 to $825,000, to meet the minimal costs of the project.

14. Heard a presentation on the process by which architects are selected for projects at the University.

15. Established the Howard H. and Jessie T. Watkins University Professorship, unrestricted as to field, with holders to be designated by the Provost for five-year, non-renewable terms.

16. Meeting as General Members of the Stanford University Hospital, approved the participation of Stanford University in the consolidation of the pediatrics programs of Stanford University Hospital and Children's Hospital at Stanford as detailed in the Consolidation Agreement and authorized the President of Stanford University and the President of the Hospital to sign the Agreement on its behalf.

17. Approved the replacement of the Stanford Cabinet by a Subcommittee on Development of the Committee on Academic Affairs and Development.

18. Approved revisions on Article III, Section 4, and Article V, Section 1, of the Statement of Policy on Appointment and Tenure.

19. Received the Annual Report of the Board of Overseers of the Hoover Institution on War, Revolution and Peace.

20. Heard a report from William E. Stone, Director of Stanford Alumni Association, on progress and prospects for the Association.

Faculty appointments, promotions approved by Board of Trustees

On September 14, 1982, the Board of Trustees made the following appointments, effective September 1, 1982, unless indicated otherwise:

Promotions

Lawrence V. Berman, professor of religious studies; Charles P. Bonini, professor of management science, G.S.B.; Steven G. Boxer, associate professor of chemistry; William R. Brody, professor of radiology and, by courtesy, of electrical engineering; Brian J. Cantwell, associate professor of aeronautics and astronautics and mechanical engineering; Corey S. Goodman, associate professor of biological sciences; Vincent R. Hentz, associate professor of surgery; Diane W. Middlebrook, professor of English, 9/1/83; Boyd C. Paulson, professor of civil engineering; Robert D. Simoni, professor of biological sciences; Samuel Strober, professor of medicine.

Reappointments

Robert D. Beuchel, professor of clinical anesthesia; Russel Caflisch, assistant professor of mathematics; John C. Cox, associate professor of finance, G.S.B.; Savas Dimopoulos, assistant professor of physics; Iris F. Litt, associate professor of pediatrics; David M. Maurice, adjunct professor of surgery; Michael I. Taksar, assistant professor of operations research; Charles E. Whitcher, professor of clinical anesthesia; Gio C. M. Wiederhold, assistant professor of computer science.

Appointments

Elizabeth A. Abel, assistant professor of dermatology; Michael D. Amylon, assistant professor of pediatrics; Douglas B. Bernheim, assistant professor of economics; Charles Bigelow, assistant professor of art and computer science; John C. Boothroyd, assistant professor of medical microbiology; David L. Burke, assistant professor at the Stanford Linear Accelerator Center, 10/1/82; Eugene C. Butcher, assistant professor of pathology; Dennis R. Carter, associate professor of mechanical engineering, 10/1/82; Mark W. Denny, assistant professor of biological sciences; John A. DuPre, assistant professor of philosophy; Alban K. Forcione, professor of Spanish and comparative literature, 9/1/83; Jerome H. Friedman, professor of statistics; James G. Gamble, assistant professor of surgery; Andrew R. Hoffman, assistant professor of medicine, 10/1/82; Albert J. Hofmann, adjunct professor at the Stanford Synchrotron Radiation Laboratory and the Stanford Linear Accelerator Center, 10/1/82; Chung Hong Hu, associate professor of clinical dermatology; James L. Lear, assistant professor of radiology.; Edward R. North, assistant professor of surgery; Susan P. Perrine, assistant professor of pediatrics; Helen L. Reed, assistant professor of mechanical engineering; Lawrence A. Rinsky, associate professor of clinical surgery; Pierre N. Saint-Amand, assistant professor of French; Frank H. Sarnquist, associate professor of clinical anesthesia; Richard H. Scheller, assistant professor of biological sciences; Lila R. Stuart, adjunct professor of music.

Report Matters

James L. Adams, professor of industrial engineering and engineering management and mechanical engineering, reappointed associate dean of the School of Engineering, 9/1/82 to 8/31/85.

Fernando Alegria, professor of Spanish, reappointed Acting Chairman of the Department of Spanish and Portuguese, 9/1/82 to 12/31/82.

Theodore M. Andersson, professor of German studies, appointed chairman of the Department of German Studies, 9/1/82 to 8/31/84.

John I. Baruman, J. G. Jackson—C. J. Wood professor of chemistry, reappointed chairman of the Department of Chemistry, 9/1/82 to 8/31/85.

Gilbert M. Masters, adjunct professor of civil engineering (teaching and practice), appointed associate dean of the School of Engineering, 9/1/82 to 8/31/85.

John McCarthy, professor of computer science, reappointed professor, by courtesy, of electrical engineering, 9/1/82 to 8/31/87.

Walter Mischel, professor of psychology, appointed chairman of the Department of Psychology, 9/1/82 to 8/31/85.

Robert Osserman, professor of mathematics, appointed chairman of the Department of Mathematics, 9/1/82 to 8/31/83.

John Perry, professor of philosophy, reappointed chairman of the Department of Philosophy, 9/1/82 to 8/31/83.

Nathan Rosenberg, Fairleigh S. Dickinson, Jr. professor of public policy, reappointed chairman of the Public Policy Program, 9/1/82 to 8/31/83.

James J. Sheehan, professor of history, appointed chairman of the Department of History, 9/1/82 to 8/31/85.

Myra H. Strober, associate professor of education, reappointed associate professor, by courtesy, of economics in the Graduate School of Business.

Arthur F. Veinott, Jr., professor of operations research, appointed chairman of the Department of Operations Research, 9/1/82 to 8/31/85.

Timothy R. Warner, appointed associate provost effective 9/1/82.

Stanley G. Wojcicki, professor of physics, appointed chairman of the Department of Physics, 9/1/82 to 8/31/85.

Faculty Emeritus Appointments

Ernest C. Arbuckle, appointed dean of the Graduate School of Business and professor of business management, emeritus, effective 6/14/68.

Harry S. Mosher, appointed professor of chemistry, emeritus, effective 9/1/81.

Contracts and grants

Following is a selected list of government and nongovernment contracts and grants of $200,000 and over, received for the months of April, May, June and July:

FEDERAL

New Contracts

David C. Luckham, electrical engineering, "Analysis and Verification of High Order Language Programs," $852,368 from the Department of the Navy for 2 years.

John McCarthy, computer science, "Basic Research in Artificial Intelligence and Formal Reasoning," $543,122 from the Department of the Navy for 2 years.

John McCarthy, computer science, "Image Understanding," $1,046,733 from the Department of the Navy for 2 years.

Oleg D. Sherby, materials science and engineering, "Mechanical Behavior Ultrafine-Grain Aluminum Alloys," $226,250 from the Department of the Navy for 18 months.

Gio C. M. Weiderhold, computer science, "Management of Distributed Knowledge," $655,203 from the Department of the Navy for 2 years.

Daniel B. Debra and John V. Breakwell, aeronautics and astronautics, "Gravity Gradiometer Studies," $330,110 from the Air Force for 3 years.

Arthur L. Schawlow and Mason R. Yearian, W. W. Hansen Laboratories of Physics, "The Evaluation of the Mark III Linac as a High Current Source for FEL Experiments," $260,898 from the Air Force for 6 months.

Joel Ferziger and Joseph Oliger, computer science, "Center for Research on Large Scale Scientific Computing," $1,345,552 from the Department of the Navy for 33 months.

Drew V. Nelson and John C. Shyne, materials sciences and engineering, "The Use of Surface Acoustic Waves to Study Small Fatigue Cracks," $365,000 from the Department of Energy for 3 years.

William E. Spicer, Stanford Electronics Laboratories, "Novel Approaches to Passivation of Si for VHSIC Based on Fundamental Studies," $431,289 from the Department of the Army for 3 years.

Contracts—Amendments

Arthur I. Bienenstock and Herman Winick, Stanford Synchrotron Radiation Laboratory, "SSRL Beamline," $1,200,000 from NSF for 1 year.

Perry McCarty, civil engineering, "Autohydrolysis of Organic Residues," $209,734 from the Department of Energy for 1 year.

Amos N. Tversky, psychology, "Decision and Judgement," $312,405 from the Navy for 2 years.

James D. Meindl, Stanford Electronics Laboratory, "Joint Services Electronics Program," $250,068 from the Department of the Army for 2 years.

Bruce G. Buchanan, computer science, "Recognizing and Articulating Diagnostic Skills in an Intelligent Tutoring System," $714,122 from the Department of the Navy for 3 years.

Anthony E. Siegman, W. W. Hansen Laboratories of Physics, "Microwave Research ISEP," $363,000 from the Department of the Navy for 1 year.

Fouad A. Tobagi, electrical engineering, "Real Time Communication Systems Design Analysis and Implementation," $458,658 from the Defense Advanced Research Projects Agency for 2 years.

Leonard G. Tyler and Von R. Eshleman, Stanford Electronics Laboratories, "Voyager Uranus," $991,000 from NASA for 54 months.

New Grants

Ingolf Lindau, Stanford Synchrotron Radiation Laboratory, "Relationship of Atomic and Electronic Structure of Semiconductor Surfaces and Interfaces," $200,000 from NSF for 7 months.

Ronald Levy, Michael P. Link, and Saul A. Rosenberg, Department of Medicine, "Human Anti-Tumor Therapy with Monoclonal Antibodies," $307,831 from NIH for 1 year.

James A. Spudich, Roger D. Kornberg, Peter Parham, Peter B. Sargent, Lubert Stryer, and Peter N. Unwin, structural biology, "Membrane Channels, Receptors and Anchors," $448,222 from NIH for 1 year.

Grants—Amendments

Daniel Bershader and Jean Mayers, aeronautics and astronautics, "A Summer Program of Faculty Fellowships," $278,127 from NASA for 15 months.

Carl Djerassi, chemistry, "Resource-Related Research—Computers and Chemistry," $281,686 from NIH for 1 year.

William C. Fowkes, family, community and preventative medicine, "Primary Care Associate Program," $230,653 from the Health Resources Administration for 1 year.

Theodore H. Geballe, Center for Materials Research, "Materials Research Laboratory Program," $2,000,000 from NSF for 1 year.

George S. Harell, radiology, "Comparison of Micro-Spheres and RBS Behavior In Vivo," $245,355 from NIH for 1 year.

Henry S. Kaplan, radiology, "Biological Aspects of Carcinogenesis," $347,541 from NIH for 1 year.

Henry S. Kaplan, radiology, "Clinical Cancer Research Center Program, $706,375 from NIH for 1 year.

Henry M. Levin, School of Education, "Plans for Fiscal Year 1982-Institutional Grant," $779,922 from the National Institute of Education for 7 months.

Antony E. Siegman, W. W. Hansen Laboratories of Physics, "Laser Physics and Laser Techniques," $384,551 from the Department of the Air Force for 2 years.

Luigi Cavelli-Sforza, genetics, "Genetics Research Projects," $471,220 from NIH for 1 year.

Carl Djerassi, chemistry, "Marine Chemistry with Special Emphasis on Steroids," $298,977 from NIH for 1 year.

Robert Hofstadter, W. W. Hansen Laboratories of Physics, "High Energy Physics Program," $452,500 from NSF for 1 year.

Henry S. Kaplan, radiology, "Human Hybridoma Antibodies in Neoplastic Disease," $295,261 from NIH for 1 year.

Paul V. Roberts, David Freyberg, James O. Leckie, Perry L. McCarty, George A. Parks, and Robert L. Street, civil engineering, "Evaluating Groundwater Contamination Risks Resulting from Hazardous Waste Disposal," $941,400 from the Environmental Protection Agency for 1 year.

Arthur L. Schawlow and Theodor W. Hansch, W. W. Hansen Laboratories of Physics, "Spectroscopy and Quantum Electronics," $309,000 from NSF for 1 year.

Robert T. Schimke, biological sciences, "Molecular Mechanisms in Resistance to Folate Analogues," $249,176 from NIH for 1 year.

Stanley L. Schrier, medicine, "Metabolism of Erythrocyte Stroma," $232,736 from NIH for 1 year.

George R. Stark, biochemistry, "Aspects of Control in Mammalian Gene Expression," $277,283 from NIH for 1 year.

Edward B. Stinson, Carl F. Gromet, and Margaret Billingham, cardiovascular surgery, "Clinical Heart and Lung Transplantation," $1,533,518 from NIH for 1 year.

Irving L. Weissman, pathology, "Normal and Neoplastic T and B Lymphocyte Maturation," $221,406 from NIH for 1 year.

Merton R. Bernfield, pediatrics, "Extracellular Materials and Embryonic Organ Formation," $258,884 from NIH for 1 year.

Thomas G. Binford, computer science, "Exploratory Research in Integrated Programmable Automation," $248,304 from NSF for 1 year.

David A. Clayton, Medical School, "Medical Scientist Training Program," $589,368 from NIH for 1 year.

Philip C. Hanawalt, biological sciences, "Cellular and Molecular Biology Training Program," $373,221 from NIH for 1 year.

David M. Maurice, surgery, "Control of Corneal Hydration," $339,639 from NIH for 1 year.

Thomas C. Merigan, Department of Medicine, "Interferon, Immunity and Latent Viruses," $235,735 from NIH for 1 year.

David A. Prince, Bruce Ransom, Kao Ling Chow, Barry Tharp, neurology, "Epilepsy Research Program," $440,471 fron NIH for 1 year.

Richard N. Zare, chemistry, "State Selection and State Detection of Molecules with Lasers," $224,484 from NSF for 1 year.

Richard H. Britt, surgery, "Hyperthermia in the Treatment of Brain Tumors," $232,737 from NIH for 1 year.

James F. Fries, Department of Medicine, "A National Arthritis Data Resource (ARAMIS)," $472,405 from NIH for 1 year.

George M. Hahn, radiology, "Tumor Radiochemotherapy—Effects of Ultrasound and Heat," $261,793 from NIH for 1 year.

Henry S. Kaplan, radiology, "Clinical Cancer Research Center Program" $1,693,682 from NIH for 1 year.

Arthur Kornberg, biochemistry, "DNA Transactions and Aging," $646,370 from NIH for 1 year.

Eleanor E. Maccoby, psychology, "Basic Processes in Cognitive and Social Development," $469,923 from NIH for 1 year.

Arturo Pacheco, School of Education, "Bilingual Education Doctoral Fellowship Program," $203,920 from the Department of Education for 1 year.

David D. Perkins, biological sciences, "Genetics of Neurospora," $245,075 from NIH for 1 year.

Gerald M. Reaven, Department of Medicine, "Endocrinology of Aging," $436,972 from NIH for 1 year.

David C. Weber, University Libraries System, "Improving Access to Microform Research Resources: Early American Imprints: 1806 to 1810," $231,030 from the Department of Education for 1 year.

Peter D. Wood, Department of Medicine, "Exercise Training and Plasma Lipoproteins in Man," $386,589 from NIH for 1 year.

NON-FEDERAL

New Contracts

Robert L. Street, civil engineering, "Air Quality Mode, Development—Coastal Regimes," $245,843 from the Electric Power Research Institute for 32 months.

Contracts—Amendments

Sidney A. Self and Morton Mitchner, mechanical engineering, "Basic Studies in Electrostatic Precipitation," $250,435 from the Electric Power Research Institute for 9 months.

Gordon S. Kino and H. John Shaw, W. W. Hansen Laboratories of Physics, "Acoustic Technique for Measuring Stressed Regions in Steel," $351,091 from the Electric Power Research Institute for 1 year.

New Grants

Rudolf H. Moos, psychiatry, "Measuring Environmental Stressors and Coping Resources," $295,306 from the John D. and Catherine T. MacArthur Foundation for 3 years.

Donald E. Knuth, computer science, "Research on Computer Typography," $975,000 from the System Development Foundation for 3 years.

Grants—Amendments

Nathan Rosenberg, economics, "Undergraduate Public Policy Studies Program," $260,000 from the Alfred P. Sloan Foundation for 3 years.

John M. Chowning, music, "Support of the Center for Computer Research in Music and Acoustics (CCRMA), $2,321,637 from the System Development Foundation for 5 years.

Comparative education top subject for October conference at SIDEC

The Comparative and International Education Society (CIES) will hold its Western regional meeting at Stanford October 22-24, hosted by Stanford's program in International Development Education (SIDEC).

Those attending will include several hundred faculty and graduate students from universities throughout the Western U.S., Canada, and Mexico, as well as scholars from Brazil, France, Turkey, and the Philippines, including many SIDEC alumni. "Critical Paradigms in Social Theory, Research, and Practice: Implications for Comparative Education" will be discussed in several panels and the following general sessions:

* Higher Education and the Limits of Relative Autonomy: The Transformation of the Community College (Jerome Karabel, The Huron Institute)

* The "Political Language" of Comparative Education: Scholarship and Symbols (Hans N. Weiler, Stanford)

* Education and Social Transformation: La Cruzada de Alfabetizacion in Nicaragua (Francisco Lacayo, Vice Minister for Adult Education, Nicaragua)

* Class, Gender, and Curriculum Control (Michael W. Apple, University of Wisconsin, Madison)

* Critical Paradigms and Comparative Education (Carlos A. Torres, Stanford)

In addition to these plenary sessions, a total of 18 panels will deal with such issues as Educational Development and Educational Reform, Education and Radical Change, Critical Departures in Research Methods and Research Training, Culture and Language in Education, Education and Change in Asia, The Political Economy of Schooling in Brazil, Education and Legitimacy in Comparative Perspective, Policy and Administration in Education, Education Policy in the U.S. and Australia, and Education, Work, and the State in Mexico.

The conference has been prepared by an organizing committee of SIDEC faculty and graduate students under the chairmanship of Hans N. Weiler and Carlos A. Torres.

Financial assistance is being provided by the Cubberley Lectureship Fund of the School of Education, the Graduate Division, and the Center for Research in International Studies.

The conference program and registration information is available from CIES Conference, SIDEC School of Education, Stanford University, Stanford, CA 94305. Phone (415) 497-4644.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827 or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Nonexempt

30961-PM (JCC:1747) LIBRARY SPEC I: 50%; fixed term 9/27/82-9/26/83; 1-5pm; performs duties in Catalog Dept; keys in bibliographic records fr worksheets into RLIN database; corrects coding errors that are received on-line during inputting process; other duties as assigned; OUALIFICATIONS: typ 45; atten to detail; good clerical skills; ability to learn RLIN II or other automated sys; prev exp w/ automated sys desirable; reading knowl of one or more foreign langs desirable; send appl/resume to Bob Johnson, Green Lib, Room 223 (497-3152).; B10; $595-623.

30962-PM (JCC:1747) LIBRARY SPEC I: 50%; fixed term 9/27/82-9/26/83; 8:30-12:30; performs duties in Catalog Dept; keys in bibliographic records fr worksheets into RLIN database; corrects coding errors that are received on-line during inputting process; other duties as assigned; OUALIFICATIONS: typ 45; atten to detail; good clerical skills; ability to learn RLIN II or other automated sys; prev exp w/ automated sys desirable; reading knowl of one or more foreign langs desirable; send appl/resume to Bob Johnson, Green Lib, Room 223 (497-3152).; B10; $595-623.

27080-PM (JCC:1755) LIBRARY SPEC II: Lib Spec in Catalog Dept of Western Languages Collection of Hoover Institution Lib; processing lib mat'ls using RLIN-2; inputting original cataloging; searching RLIN data files, public card catalog, Nat'l Union Catalog, New Serial Titles, & other reference tools; helping to train new lib specs in inputting & searching at terminal; correcting discrepancies in maintenance function; typing series & cross-reference cards; QUALIFICATIONS: typ 45+; Catalog dept exp required; familiarity w/ RLIN or other lib automated sys; knowl of one or more Western Langs; detail orientation; accuracy in typing; send appl/resume to Joseph Kladko, Hoover Institution, Stanford, CA 94305; or call 497-2054.; B12; $1310-1373.

31950-BP (JCC:2454) OFFICE ASST II: Act as relief receptionist for breaks, vacations, & other absences; asstant to personnel officer, processing & recording applications, forms, PAF, PDF; record sick leave & vacations reports; keep records for offc accts & distribute budget statements; operates word processor/approx 2,000 ltrs/yr to applicants; taking care of IBM machine 3 mos out of the yr; QUALIFICATIONS: typ 50; accurate typing skills; exp in answering business phones & taking messages; willingness to be trained on word processor; exercise good judgment; willing to work w/ interruption; familiar w/ univ payroll helpful; send appl/resume to Liz Trujillo, 301 Encina Hall, Stanford, CA 94305.; 1 B09; $1130-1189.

21650-BP (JCC:2470) OFFICE ASST IV: Asst telecomm mgmt in the development & preparation of the annual budget; develop an initial budget for subcomponents of the operations group budget; make recommendations to mgmt re: various line items in the budget; coord paper flow of all user serv requests w/ vendor & user; generate logs & reports of status of serv order requests using word processor and/or on-line data base; screen & route telephone calls for entire dept; take minutes of mtgs for multiple parties, etc; QUALIFICATIONS: high sch'l or equiv exp & training; thorough knowl of offc procedures, offc equip't & sound judgement; knowl of or exp in CIT, WYLBUR, SCRIPT, Word processing, & Apple II; accurate typing skills; basic math skills; send appl/resume to The Committee, 327 Bonair Siding., B14; $1440-1514.

26088-PM (JCC:2470) OFFICE ASST IV: Fixed term 9/20/82-5/14/83; maintain dept law lib; update legal periodicals; order new books & publications; maintain accurate index of all lib holdings; pay invoices & renew subscriptions; keep detailed, accurate records of lib expenses, orders, etc; monitor lib budget; corresp w/ publishers, vendors, Univ depts as nec; maintain file sys; order file sys supplies, etc; QUALIFICATIONS: typ 60; 2-3 yrs exp or edu in lib or offc informa sys; good oral & written commu skills; meticulous & attentive to detail; familiarity w/ Univ policies & procedures highly desirable; send appl/resume to Patricia Chor, University Counsel's Office, P. O. Box N, Stanford, CA 94305.; B14; $1440-1514.

33284-PM (JCC:2546) SECRETARY I: 50%, 1-5; answer phones; screen calls; take message; support other sec w/ ordering & maintaining offc supplies, prepare purchase requisitions for lab supplies; keep daily log book & file all reqs; sorting mail; collecting & distribution of radiation badges, etc; QUALIFICATIONS: typ 45-50; good command of English; med terminology helpful; good organizational ability; able to work independently & deal effectively w/ the public; send appl/resume to S. Butler, R-132, 497-6101.: B09; $565-595.

14255-PM (JCC:2554) SECRETARY II: 75%, 9-4; performs finished form typing of corresp, manuscripts & proposals; sel data & compiles reports & bibliographies fr genl instructions; sets up & maintains a variety of offc files; operates word processor, offc copiers, & dictating machines; receives & screens telephone calls for Div Coordinator; bkup functions for front desk reception & Div phones; schedules routine AV/TV serv requests for projection & video playbacks; QUALIFICATIONS: typ 60-70; 2-3 yrs of clerical/sec'l exp; knowl of word processing & use of dictating machines desirable; contact: Marlene Cork/Robert Hecht, 497-6813.; B11; $935-983.

33353-PM (JCC:2562) SECRETARY III: 50%, 8-12; Sec to Chief of Ophthalmology Section of Veterans Admin Med Ctr in Palo Alto; able to manage offc w/ complete sec'l duties incl opening mail, answering telephones, screening visitors, set up conference, check grant budgets, type finished corresp, complete forms & order supplies; QUALIFICATIONS: typ 70-75; good sec'l skills & med terminology; able to edit manuscripts & papers; this position is an add'l 50% Veterans Admin Med Ctr position and a CIVIL SERVICE RATING REQUIRED FOR THE VA MED CTR POSITIONS; send appl/resume to Mariann M. Crane, Division of Ophthalmology, A227 Med Ctr.; B14; $720-757.

95160-JM (JCC:2596) SECY II-SPEC: 50%; (afternoon); asst in providing all sec'l services for group of 20; type genl corresp, tech papers (physics & engineering) using math symbols, etc; QUALIFICATIONS: typ 50 wpm; good spelling skills; several yrs offc exp; some knowl of bookkeeping, recordkeeping & filing sys; ability to learn use of computer terminals; good interaction skills.; B12; $655-687.

26932-BP (JCC:2630) SPECIALIST TYPIST: Typing fr handwritten notes, dictated notes, or verbal instructions received fr 22 professors who specialize in various areas of anthropology constituting great diversity in specialized terminology, i.e., med, psychological/symbolic, economic, political, legal, etc; typing may incl use of Greek symbols & foreign langs; answering phones in absence of receptionist, etc; QUALIFICATIONS: typ 65-70; ability to listen & follow oral & written directions; ability to work under pressure to meet deadlines; excel understnading of English lang; ability to sit for extended periods of time; knowl of word processing on Lexitron or willingness to learn; ability to work as a member of a team; send appl/resume to Betty Hummer, Bldg. 110, Rm 111-F, Anthropology Dept., 497-3421.; B12; $1310-1373.

32867-TC (JCC:6810) SOC SCI RES ASST I: Research assistant to a professor & his research staff in Social Ecology Lab; analyze data fr ongoing psychological res projs using existing computer programs & hand calculators; involve in some bibliographical res related to res program topics; contacting & obtaining data fr subjs thru telephone & personal interviews; QUALIFICATIONS: BA in social sci or equiv; knowl of statistics & data analysis; familiar w/ psychological statistical tech; access to own transportation for short, local trips.; B12; $1310-1373.

33360-PM (JCC:2512) Offc Asst III-S: Transcription of Orthopedic Surgery Clinic notes; letters to referring physicians; discharge summaries & operative notes; genl receptionist duties; greet visitors, patients & their families; answer phones; distribute mail; order offc supplies; QUALIFICATIONS: typ 60; requires knowl of med terminology (Orthopedics preferred); accurate typing & transription; knowl of or ability to learn use of word processing eqpt; pleasant phone manner; able to interat effectively w/faculty, residents & patients; will be working in offc w/many people in close proximity; nonsmoker preferred; contact: Jane Pelton, Med Ctr R171, 497-7609; B12; $1310-1373

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, Sept. 28, in room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Exempt

33682-VW (JCC:2036) ADMIN SERVICES MGR II: Manage business & admin affairs of Dept of Neurology; relieve Chairman & faculty members of dept of admin respon; have respon & authority for overall admin in support of the research, teaching & patient care function of the total dept; negotiation on behalf of dept w/ outside agencies, such as Nat'l Institute of Health, & other public & private institutions; negotiate w/ Hospital on behalf of Dept labs, etc; QUALIFICATIONS: strong financial & analytical skills; prev exp in supvn & offc mgmt required; demonstrated ability to interact w/ faculty & sr. administrators; knowl of Univ finance & genl acctg procedures, personnel policies & preparation of fiscal reports desirable; interest or prev exp w/ computer sys desirable; bkground in med or academic environment preferred.; C07; $2113-2724.

94111-JM (JCC:2070) ADMIN ASST II: Prov admin assistance to Plant Officer & prof'l staff, e.g., prepare reports, assemble audits & appraisals; schedule mtgs, review budgets; supv clerical staff; QUALIFICATIONS: several yrs of applicable exp & edu in admin, policies & procedures; ability to develop & improve recordkeeping procedures; good interactive skills; supervisory exp or ability; contracts admin exp desirable.; C05; $1670-1890.

44514-DS (JCC:2120) ACCOUNTANT I: Prov acctg support to various div Directors w/in CIT, principally the directorate staff for Admin Informa Sys Div; control of operating statement data; budget preparation & control; acctg payable functions; purchasing activities; prep of various acctg enhancements; liaison work w/ approp cost ctr mgrs; calculate internal & external rates for Ctr programmers; close interaction w/ Directors of several Divisions; QUALIFICATIONS: Bachelor degree in acctg or related exp in acctg & acctg sys, audit, budget & financial planning analysis; requires excel ability to analyze, organize, direct varied admin functions; excel oral & written skills; bkground in Univ acctg procedures desired; knowl of WYLBUR & SPIRES helpful.; C05; $1670-2086.

32502-JB (JCC:2254) FIN/MGMT ANALYST I: Collect & analyze data for compilation in financial reports; perform genl analyses & resolution of budget problems; asst w/ financial analyses for budget & long-range planning process, incl financial projections & trade-off analysis; monitor offc operating budgets; prov computer data-entry support; QUALIFICATIONS: energetic, self-motivated; require basic financial & analytical skills, good judgment & strong organizational skills; ability to write & commu well & to handle multiple projs & demands in a timely manner; knowl of or willingness to learn Wylbur, SPIRES, SPSS & other computing langs; BA in business admin, economics, statistics or equiv work exp preferred; professional & diplomatic manner in dealing w/ people nec; familiarity w/ Univ procedures desirable.; C05; $1670-2086.

32391-TC (JCC:3882) PHOTOGRAPHER III: Prov photographic serv for Autopsy, Surgical & Neuropathology involving color & black & white photomicrography & macrophotography for record & publications; flat copy photography for projection slides, either black & white or color; photograph research mat'l incl transilluminated mat'l for record & photomicrography & macrophotography of autopsy & surgical specimens; QUALIFICATIONS: formal biologic or med photographic training desirable; prev exp essential, especially black & white photomicroscopy of histologic sections.; C06; $1854-2312.

17877-LL (JCC:5116) PROGR SCIENTIFIC III: 8:30-5pm; respon for maintaining current sys software for 2 separate computer sys; one computer sys supports Cath/Angio Lab & incl reporting sys for hemodynamic, angiographic & electrophysiologic patient evaluations; the second computer sys performs high-speed analysis of ambulatory electrocardiograms; both sys, require continued development & implementation of various enhancements, as well as installation & trouble shooting of specialized sys hardware; collaborate in sys & software develop't & report results at national mtgs & in professional journals; QUALIFICATIONS: BS in Engrg or Sci; 1-3 yrs exp (Hewlett Packard 1000 sys preferred); some knowl of analog & digital design & construction; exp in (cardiovascular) med desirable; must be highly motivated.; C07; $2113-2724.

23964-LL (JCC:5588) LIFE SCI RES ASST I: Perform radioimmunoassays & related procedures for quantitations of hormones & autoantibodies in a specialized clinical lab & to asst in ongoing research projs; occasional prep of biological mat'ls & isolation & radioiodination of proteins used in various tests; processing of blood specimens for testing; record keeping; maintenance of lab equip't; ordering of lab supplies; QUALIFICATIONS: BS degree or equiv training & exp w/ strong bkgound in biochemistry & immunology; some work exp in genl lab tech essential; prior exp in radioimmunoassay field & certification as Clinical Chemist or Med Technologist essential since results of work are patient related.; C05; $835-1043.

29808-AW (JCC:4084/4092) Programmer/Analyst III/IV: Must possess a high degree of expertise & exp in sys analysis using full range of analytic skills; ability to scope & analyze into cohesive sys design, 2 or more Univ functions, interface w/other complex sys & programs & must consider decisions regarding relationships among parts of sys; involves understanding of user proceds, organization's program requirements, & documentaiton requiremt; thorough knowl of sys environs & capabilities of such eqpt as IBM 3033 (MVS) DEC, Wang; expertise in software such as COBOL, use of CICS, sys 2000, SPIRES, etc & other database mgmt sys; familiarity w/standard batch sys approaches; familiarity w/modern offc informa sys helpful; familiarity w/structured analysis/design tech; C07/C08; $1875-2974/2180-3393

Bargaining unit

29955-FM (JCC:5638) LIFE SCI TECH I: TMS Unit; do routine operation w/ analytical instruments (mass spectrometry) in Chemistry Dept; upkeep of instrument(s) under close supvn of prof'l personnel; QUALIFICATIONS: no prev exp w/ equip't is nec; skilled in use of hands & willing to perform detailed, exacting & delicate work.; A18; $7.01.

24641-FM (JCC:5786) LAB ASST I: TMS Unit; 8:30-5:30; approx 80% time will be spent in maintenance of a colony of experimental insects; involve growing plants & feeding them to immature growth stages of the insects; sorting & organizing insect pupae in prep for adult emergence; caring for adult insects; mating adult insects & collection of their eggs; 20% time will be devoted to learning & performance of various routine biochemical lab procedures; QUALIFICATIONS: prefer college level exp w/ biological sci; relevant tech employment exp helpful but not essential.; A13; $6.24.

24640-FM (JCC:5794) LAB ASST II: TMS Unit; asst in field & lab sampling programs: collect , sort, & analyze plant & soil samples; collect & summarize environ data; asst in greenhouse maintenance & field plots: propagation & culture of plant mat'l, involving plant establishment, watering, fertilization, & labelling; asst in lab growth chamber: planting & processing of plant mat'l; calibration & maintenance of chambers; QUALIFICATIONS: prev work w/ plant mat'l; must have flexible schedule & be able to work w/ little supvn.; A16; $6.69.

24468-JB (JCC:6492) LAB MECHANICAN III: TMS Unit; fabricate quality parts & assemblies fr a variety of mat'ls to exacting tolerances; involved in construction & installation of large research apparatus such as wind tunnels & water channels; build & install a variety of instrumentation such as pressure probles & like devices; QUALIFICATIONS: requires a min 5 yrs exp (prototype machinist, model making); 2 yrs exp in specialty area of acrylic fabrication; a relevant bkground in shop math is a must; basic skills in all phases welding.; A41; $12.13.

30233-FM (JCC:7810) MAINT PERSON LDR PREM: 8-4:30; performs repairs & maintenance tasks in Escondido Village, Manzanita Park, & Mirrielees House; leads & directs other workers & part time student crews; receives instructions, supvn & work specifications fr shop supvr; motivates employees to meet quality standards; assts supvr or worker in solving tasks related problems; insures that proper safety procedures & precautions are followed at all times, etc; QUALIFICATIONS: able to inspect & report on work of others; able to work cooperatively & effectively w/ co-workers & customers; journeyman abilities in at least 2 or more of the areas; ability to follow verbal, written, or work sketch instruc & be able to commu these to others; know & be willing to implement affirmative action goals; able to act for supvrin his absence in areas of scheduling, estimating & assigning work.; A39; $11.58.

94915-JM (JCC:8262) INSTR MECH-RES FAC: TMS Unit; perform assigned maintenance, adjustment & repair of all plant process instrumentation plus overhaul, modification of & fabrication of a wide variety of experimental instrumentation & controls for use on sys; QUALIFICATIONS: high sch'l or equiv; tech college courses or equiv desirable; several yrs related exp ability to work fr prints, sketches and/or verbal instructions; able to qualify for gov't driver's license.; A37; $1912.

94926-JM (JCC:8270) INSTR MECH SPEC-RES FAC: TMS Unit; perform assigned maintenance, adjustment & repair of all plant process instrumentation plus overhaul, modification of & fabrication of a wide variety of experimental instrumentation & controls for use on sys; respon for planning, scheduling, work distribution and/or direction and/or training of other instrument mechanics; design new instrumentation sys, etc; QUALIFICATIONS: high sch'l or equiv; tech college courses or equiv desirable; several yrs related exp; ability to work fr prints, sketches and/or verbal instructions; able to qualify for gov't driver's license.; A39; $2007-2103.

18561-FM (JCC:8586) HV/AC Mech, Maintenance: TMS unit; 8-4:30; practical skills reqd, soldering, brazing, cutting, ability to read & interpret blueprints & wiring schematics; piping & plumbing tech as they apply to heating, ventilating & air conditioning trade; knowl of refrigerants & their proper application; knowl of spec instruments & tools used extensively in HV & A/C trade & as recording instruments; refrigeration gauges, ohm meter, volt meter tachometer, lead detector, pyrometer, etc; A35; $10.49

18569-FM (JCC:8586) HV/AC Mech Maint: TMS unit; 8-4:30; inspect, troubleshoot, repair, & maintain refrigeration as it applies to all phases of (a) food preparation & storage, (b) lab & res eqpt; all types of air conditoning units & their related eqpt; all bldgs heating & cooling temperature control sys; all ventilation & air distribution sys, etc; practical skills reqd, soldering, brazing, cutting; ability to read & intrpret blueprints & wiring schematics; piping & plumbing tech as they apply to heating, ventilating & air conditioning trade; knowl of refrigerants & their proper application; knowl of spec instruments & tools used extensively in HV & A/C trade & as recording instruments; refrigeration gauges, ohm meter, volt meter tachometer lead detector, pyrometer, etc; A35; $10.49

Stanford Alumni Association sponsors open conference on 'Living Well'

Participants in "Living Well," a three day-conference sponsored by the Stanford Alumni Association, will assess their own heritage and habits, then set goals to promote health and longevity.

Scheduled for Oct. 7-10, the program will be held at the Stanford Sierra Camp at Fallen Leaf Lake.

Five members of the Stanford Medical School faculty will be joined by a professor of education and psychology in presenting the seminar. They will explore choices about diet, physical activity, and handling stress, emphasizing that small changes can have a powerful impact on well-being. "Personal Vitality Reports" will be analyzed in advance to help determine participants' risk levels for each of the major diseases.

Dr. John W. Farquhar, head of the Stanford Heart Disease Prevention Program, will participate, as will Dr. Peter Wood, deputy director, and Mia Clark, nutritionist in the program.

Other faculty will be Dr. James F. Fries, associate professor of medicine and director of the Stanford Arthritis Center; Dr. John Bunker, director of health services research at the Medical School; and Carl Thoresen, professor of education and psychology at Stanford, who has written widely on behavioral modification.

Lectures are scheduled for the morning and early evening, leaving afternoons free for recreation.

An Alumni Association continuing education program, Living Well is open to all interested. Tuition is $550 for single participants and $775 for couples. Spouses are encouraged to attend.

A $50 per person deposit should be sent to the Stanford Alumni Association, Bowman Alumni House.

Rental housing

HOUSING NEEDED

□ **NOW:** Resp. female grad. student, 29, seeks studio/cottage or rm in hse w/priv. ent. & BA, light cooking and lndry facil. Conv. to campus. Courteous, $250-$350/mo. and/or poss. light wrk. xchng. Call Cynthia, 322-4996 (to 9/10) or 497-2108 (day).

□ **Feb. '83 to Sept. '83:** Visit prof. seeks 3BR apt. or hse. on or nr campus. Poss. xchng for beautiful flat nr Tel-Aviv U. Call Margaret at 497-3910 (day).

□ **Summer '83:** EXCHANGE—LONDON: Los Altos cpl would like to exchange homes with London cpl for 4-6 weeks, summer '83. Call (415) 948-5290 (eves).

□ **Jan.-March '83:** Visit. prof, Anthropology Dept., seeks 1 or 2BR furn. apt. or hse. for self & spouse. Call Betty, 497-3421 (day).

□ **Jan.-June '83:** Visit. prof., Anthropology Dept., seeks 2 or 3BR furn. apt. or hse. for self, spouse and year-old child. Call Betty, 497-3421 (day).

□ **Feb. '83 to June '83:** Visit. prof. & wife from MIT seek hse or apt, 1 or 2BR, furn., on or nr. campus. Call (415) 593-6506 or call COLLECT: (617) 369-4713; or write: 163 Valley Rd., Concord, MA 01742, c/o E. Brown.

□ **Beg. Sept. 30:** Prof. woman and college-age daughter seek safe, quiet hse. Share, or 2BR apt. to $600. Prefer MP, PA or hills nr bus. Call 497-0809 (day) or 322-0387.

March '83: EXCHANGE. Finnish-French family w/2 daughters seek 2-4 BR hse/apt. in Bay Area. Exchange for 3BR/2BA apt. in beautiful area 5 mi. from ctr. Paris. 2 cars & wkly clean. incl. Will care for pets & garden. Local refs. Write: Fourmeaux, 12, rue S. Vigneras, 92380 Garches, France.

□ **Oct. '82 to March '83:** Want to rent 2BR (or more) furn. condo or hse. Please call collect Newport Beach (714) 752-7870.

□ **Beg. Oct. '82:** Resp. female, staff/student, 34, seeks quiet studio/cottage. Will consider compatible rmmate. $250-$350/mo. Call Lisa, (415) 322-6966 after 4 pm or weekends.

□ **Jan. 3 to Feb. 16, '83:** Distinguished Emeritus Prof. visiting needs furn. rm on or nr campus. Call Barbara, 497-2651 (day).

□ **NOW:** New British faculty, wife, baby, seek unfurn. 3BR hse for 1-1½ yrs in quiet nghbrhd, nr. campus. Call 497-0935, r 497-0474.

□ **Jan. 1 to Aug. '83:** Physician on sabbatical at Stanf. & Berkeley seeks 4BR furn. hse. 2 children, 9 & 11. Willing to consider either area. Call (608) 231-2804 or write: Dr. E. Borden, 1609 Camelot Dr., Madison, WI 53705.

□ **NOW:** Female, employed at Stanf., seeks reasonably priced 1BR cottage or studio. Will consider compatible roommate. Call Mary Louise, 856-0763.

HOUSING AVAILABLE

□ **Oct. 1, '82 to Jan. 10, '83:** Luxurious 2BR/2BA condo dwntwn Los Altos. Compl. furn, 10 min. to Stanf. $950/mo. Call (415) 948-1240.

□ **NOW:** Cultured woman from France has penthouse apt. to SHARE. Sharon Hts, rm. w/priv. BA + study/den. Kitchen priv., decks w/view, gar., pool, sauna. Nonsmoker pref. $500/mo. + ½ util. Call (415) 591-8015 (lv. message) or (415) 592-6885.

□ **NOW:** Furn. 3BR/1BA hse, Skyline. Spac. living, outside areas for family. No smokers or cats. 35 min. drive to campus includes 5 mi. of curvy mtn. roads. Sep. qtrs kept for pers. use. Elec. avrge $120. $650/mo. Call (415) 493-8363 for appt.

□ **NOW:** Tranquil oasis 9 min. to Stanf. Priv. guest-wing rear of Eng. cott. Sep. entry, 1BR (king size bed)/1BA. Fully furn. incl. linens, dishes, TV, phone, util, grdnr. LR w/frpl. Fenced grdn/patio. Driveway parking. No pets, nonsmoker, 1 person only. RENT by mo. Call (415) 856-0608.

□ **NOW:** Prime, very private 3BR/2BA hse. Large LR & FR, 2 frpl. ½ acre, low foothills. $1950/mo. or best offer. 1 yr., poss. longer or lease option. Call (415) 948-4493.

□ **NOW:** Unique, contemp. hillside hse. 3BR/2BA + 2 half BA. Rec. rm/bar. Sep. DR. 20 ft. cell, redwood & glass, decks, hot tub. For lease furn. Priv. cul-de-sac in high Ladera. Avail. 1 yr. max. $3000/mo. Call (415) 854-7140.

□ **Reg. Avail:** 1 & 2BR, furn. & unfurn. apts. & twnhses in Palo Alto & Menlo Pk in good neighborhoods, close to campus. $525 to $800/mo. Call Shirley, 493-2321 or Jane, 968-4957.

□ **Beg. end Sept. '82:** Lge. 1BR lux. condo. 3 mi. to campus; carpets, drapes, appl., gar., deck. 2 pools, sauna, tennis, game rm. $500/mo., option to buy. Call 322-4418 (eve).

□ **Jan. to June 30, '83:** Furn. hse. 3BR/2BA, W/D, frpl, fenced yd., conv. to campus, shops. Children ok. $850/mo. Call 497-9253 (day), 327-5641 (eve).

□ **Sept. '82 to June/Sept. '83:** Looking for nonsmoker, pref. female, to share furn. 3BR/2½BA Old Mill Twnhse. Pool, jacuzzi, sauna, prkng. $300/mo. + 1/3 util. Call John, 497-3944 or Kateri, 949-3297 (8 a.m. to midnite).

□ **Beg. Sept. 15, 1 yr. lease:** Exec. home, 3BR/2BA, hot tub, lux. rec. rm. w/magnificent view. Unfurn. Easy commute. $1550/mo. Call Guy Lau, (415) 342-6613.

□ **NOW:** 2 story, furn. or unfurn. hse, 3BR/2BA, newly redecorated, elec. oven, gas cook-top, frig, DW, W/D, FR, study. Fenced yd. Walk/bike to campus. Family w/children pref. Nr. Rinconada Pk. $1200/mo. incl. garden maintnce. Call Shannon Penrose, 321-4542 (lv. message), 328-2234.

□ **NOW:** SHARE lovely 3BR/2BA hse, 20 min. to campus. Lge patio, yd, quiet location. Nonsmoker only. $345/mo. + ⅓ util. Call (408) 255-5947 day/eve.

□ **Sept. 15, long term:** So. Palo Alto Eichler, 3BR/1BA, unfurn. Quiet street. $700/mo. Call 329-1082.

□ **Jan. 1 to June 15, '83 (flex):** Fully furn. 3BR/2BA lge. campus hse. Lge garden & patio. Children ok, no pets. $1500/mo. incl. gardener, water, wkly hse-cleaning. Call 857-9127 or 497-2180 (day).

□ **Avail. Sept. 21, lease:** Unfurn. hse in Menlo Pk, 5BR/2½BA, den. Stove, frig, carpeted. 5 min. to Stanf. Rent nego. Lease/purchase optin also avail. Call Chuck, (415) 854-3082 or (415) 461-9263.

□ **Beg. Sept. 1, '82:** For lease: 2BR hse w/FR, woodburning stove, all appl., gar., garden. 20 min. to campus. $625/mo. Call Arn, (415) 329-1500.

□ **NOW:** TAHOE, NORTH SHORE. 3BR/2BA vacation rental, octagon adj. Nat'l Forest. Nr. Dollar Hill. AEK, TV, phone, W/D, cozy frpl. Fall rates thru 11/30. Call (415) 324-1701.

□ **NOW:** One-half of attractive 2BR/2½BA lux. condo. In San Carlos hills. W/D, frpl, deck, gar., pool, tennis crts. $500/mo. Call Jim, (415) 854-2306 (day).

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

Computer training at Sierra Camp

The Stanford Alumni Association's Sierra Camp at Fallen Leaf Lake near South Lake Tahoe will be the site of a computer training workshop for adults Oct. 2-6.

Participants will receive 20 hours of lectures and hands-on training presented by a Santa Barbara-based training team of instructors.

The sessions are designed for business, educational and health professionals, as well as others interested in learning the basics of microcomputer operations.

Lectures include an introduction to computer technology and concepts, evaluation and selection of equipment and programs, and programming in BASIC.

The sessions will run for approximately 4 hours daily, allowing time for participants to take advantage of the Sierra Camp's hiking, boating, fishing, tennis, and other facilities.

For reservations or information, call the Sierra Camp, 916-541-1244.

Campus crime report

Sept. 13-20

Burglary/residence	1	Phone harassment	0
Burglary/nonresidence	3	Controlled substance	0
Burglary/Vehicle	1	Felony arrest	0
Theft/under $200	7	Misdemeanor arrest	19
Theft/over $200	1	Adult booking	13
Bicycle theft	4	Adult cite/release	5
Vehicle accident	2	Juvenile booking	0
Bicycle accident	0	Juvenile citation	1
Indecent exposure	0	Warrants served	8
Assault	0	Driving under influence	4

Residential Burglary:

Date	Time	Location	Property Lost	Method of Entry
9/17-18	Even.	Pearce Mitchell Complex	Misc.	Without force

Health and safety report

Accidents—most are avoidable

For the past six months the Department of Health and Safety has been listing each injury and its cause in the *Campus Report*. These injuries, from now on, will be presented by type of accident and the total number of days lost for these accidents. Presenting the accidents in this format will enable all of us to get a perspective on the most frequent types of accidents and those which cause the most lost time and perhaps pain, and enable us to enact preventive measures, including developing training programs.

Sometimes an accident involves only minor injury; this does not mean, however, that the potential for injury from similar accidents will always be of a minor nature. When an injury or near miss occurs, it usually indicates that there are causes to these incidents that need to be eliminated.

Any actions appropriate to prevent accidents must be initiated by each of us.

Accidents and injuries occurring Sept. 6-17

Type of accident or injury	Number of incidents	Days Lost
Impact with object	2	1
Contact with sharp object	1	1
Other contact caused (abrasion)	1	0
Fall from same level	1	5
Fall from height (includes stairs)	2	3
Lifting	3	15
Other: burned cornea from looking into laser beam	1	0
Overexertion	2	0

Films, panels on civil defense set

Civil defense in the event of nuclear attack will be the subject of free films and a public debate sponsored by the Stanford Arms Control and Disarmament Forum at 7:30 p.m. Thursday, Sept. 30 at Stanford's Kresge Auditorium.

The program, entitled "Civil Defense Controversy—a Public Debate," will include a 35-minute film presentation consisting of a segment of the film, "The Last Epidemic," in which Dr. Jack Geiger speaks of the consequences of an explosion of a one megaton warhead over San Francisco, and a 1978 Federal Emergency Management Agency Film, "Protection in the Nuclear Age."

The films will be followed by a public debate concerning the seven-year, $3.4 billion program outlined by the Reagan Administration designed to keep a substantial portion of the nation's population alive in the event of a nuclear war through crisis relocation planning.

The three panelists for the debate are:

Beverly Myers, director of the California Department of Health Services. Myers has refused to participate in federal relocation planning.

Loren Fields, California Office of Emergency Services. Active in civil defense programs since 1952, Fields has worked on crisis relocation planning for the State of California since 1978.

Sidney Drell, deputy director of the Stanford Linear Accelerator Center. Drell is a consultant to the Department of Defense and the Arms Control and Disarmament Agency. His position is that preparations to win a nuclear war are both dangerous and technically unsound.

The Stanford Arms Control and Disarmament Forum is a student, faculty and staff group organized to "educate the greater Stanford community about the effects and dangers of the nuclear arms race, and to promote discussion of arms control and disarmament related issues."

Skogh shows work at Faculty Club

Marianne Skogh, a weaver who taught herself photography, will show recent photographs at the Stanford Faculty Club through October.

Skogh is a Swede from Linkoping who now lives in La Honda.

In the late 1970s, she exhibited at the Museum of Modern Art in Stockholm. In California, she has shown her photographs at Southland Photo Society in Los Angeles, Palo Alto Cultural Center, Stanford Research Institute, Los Robles Gallery, Capricorn Asunder (San Francisco Art Commission Gallery), and other places.

Inklings to meet

The first fall meeting of the Stanford Inklings will be held from 5 to 7 p.m. Tuesday, Sept. 28, at the Women's Club House, Old Union.

The Inklings, a group of Christians who are *writers*, meet together twice a month (second and fourth Tuesdays) to share manuscripts, ideas, and knowledge of the writing craft. All writers are welcome.

For information call Jon, 497-0574, or Dorothy, 329-0361.

Fall quarter recreation

Encina lockers and showers: M-F 7:30 a.m.-9 p.m.; SS 9 a.m.-6 p.m.

Roble gym, lockers, showers, and weight training facilities: M-F 8 a.m.-midnight; Sat. 9 a.m.-8 p.m.; Sun. noon-8 p.m.

Olympic Gamefield, Perrier Parcourse, Angell Field (track): every day, daylight hours.

Angell Field (infield), Taylor field, IM fields (north and south): Reserved only, call 497-0505.

Maples pavilion (show ID): M-F noon-1 p.m.; closed Sept. 27 & 28.

Roble gym floor (show ID): Hours posted at Roble gym for open recreation, basketball, badminton, and volleyball.

Roble pool (show ID): M-F noon-1 p.m. faculty/staff only; T & Th 1 p.m.-5 p.m.; M, W, F 3 p.m.-5 p.m.; Sat. 1 p.m.-5 p.m. adult only-family swim; open Sat. on home game days. Oct. 2, 16, 30 and Nov. 6.

deGuerre pools (show ID): M-F noon-1 p.m.; M, W, F 1 p.m.-2 p.m.; T & Th 11 a.m.-noon; T & Th 1 p.m.-2 p.m.; M-F 5:30-7 p.m.; SS 1 p.m.-5 p.m. family swim.

deGuerre courts (show ID): M-F 10 a.m.-11 a.m. reservations only, 497-1588; M-F 11 a.m.-11 p.m.; SS 9 a.m.-11 p.m.

Tennis courts (show ID): Sign up sheets are posted on court bulletin board for the next day's play at the following times: Encina courts, 8:30 a.m.; Roble courts, 8:30 a.m.; Varsity courts, 5:10 p.m.; FSS sun-up to sun-down; M-Th when no classes are scheduled; M-F noon-1 p.m. Roble and Encina courts reserved for faculty/staff only.

Encina volleyball courts: M-Th daylight-2 p.m. and 5:30-dark; Fri. daylight-3 p.m. and 5:30-dark; SS daylight-9 a.m. and 12 noon-dark.

Encina weight room (show ID): M-Th noon-2 p.m. and 3:30-8:30 p.m.; Fri. 9 a.m.-8:30 p.m.; SS 11 a.m.-5 p.m.

Roble field, gym dance studio (show ID), gym studio 42 (show ID), gym room 33 (show ID): Check at Roble gym office.

Golf course driving range: M-F 8:30 a.m. until one hour before dark; Sat., Sun., Holidays 7 a.m. until one hour before dark.

Golf course (show ID): Mon. closed; Tues. ladies priority; T-F first available starting time; Sat., Sun., Holidays first available starting time after 11 a.m.; must obtain starting time *in person* and show ID's at the Pro Shop.

Tresidder recreation center: M-Th 8 a.m.-midnight; Fri. 8 a.m.-1 a.m.; Sat. 10 a.m.-1 a.m.; Sun. 10 a.m.-midnight; M-F no bowling until 10 a.m.

deGuerre pools and Encina weight room closed on home football days Oct. 2, 16, 30 and Nov. 6.

Dance Quorum classes begin Oct. 4

Stanford Dance Quorum offers autumn quarter classes in ballet, modern, and jazz dance techniques.

Two levels of ballet will be taught by Elizabeth Larkam. Level I meets 6-7:30 p.m. Monday and Wednesday evenings. Level II meets 7:30-9 p.m. Monday and Wednesday. A class for all levels is held Saturday from 12 noon to 2 p.m.

All ballet classes meet in Roble Dance Studio 33 and are accompanied by Bill Sorenson. First class meeting is Monday, Oct. 4.

Noon Hour Dance taught by Joy Weston meets 12 noon-1 p.m. Monday through Thursday in Roble Dance Studio 42. This modern dance-exercise class is especially for Stanford staff members.- First class meeting is Monday, October 4.

Floor barre alignment and modern dance technique classes are taught by Lisa Burnett. They are scheduled for Tuesday and Thursday in the early evening and for Saturday morning.

Jazz dance taught by Elizabeth Gustafson will meet Monday and Wednesday in the early evening.

Registration for all Quorum classes will take place at a meeting of the organization at 5 p.m. Tuesday, October 5 in Roble Lounge. Dance Quorum charges quarterly membership dues and a fee for classes.

Stanford Dance Quorum is a nonprofit student organization in operation the entire calendar year. Stanford students, faculty, staff, and their families may register for classes. The public is invited to participate in special events such as master classes, workshops, and film series.

Museum, Gallery plan docent tours

Docent tours at the Stanford Museum of Art and the Art Gallery will be held regularly during fall quarter.

The Museum tours of the permanent collection will be held at 12:15 p.m. Tuesdays and 2 p.m. Sundays; the Rodin collection at 12:15 p.m. Wednesdays and 2 p.m. Saturdays; and the print collection at 12:15 Thursdays.

Printmaking techniques will be shown at the Museum Sept. 30 through Dec. 19.

Docent tours of the Venetian 18th century exhibit at the Art Gallery are scheduled for 12:15 p.m. Thursdays, Oct. 7 through Dec. 16; 2 p.m. Sundays, Oct. 10 through Dec. 19.

Docent tours for private groups may be arranged by calling 497-3469. All tours are free of charge.

Children's Dance starts next week

Children's Dance at Stanford opens its third year with a full spectrum of classes for children ages three to 13. The autumn session beginning Sept. 29 features classes in rhythms and movement, movement and music, dance for boys, ballet, and two levels of modern dance.

Classes meet once a week—Wednesday or Friday afternoons or Saturday mornings—in Roble Dance Studios on the Stanford campus. Tuition is $32.50 for the 10-week session.

Children's Dance at Stanford instructors Elizabeth Larkam and Joy Weston encourage a creative approach to dance supported by musicality and technique. Class accompaniment includes live and recorded music and percussion instruments for the children.

For registration information and a brochure call 497-4254. Children's Dance at Stanford is sponsored by the Stanford Dance Division within the Department of Athletics Physical Education and Recreation.

ASSU classes have lots of variety

The Associated Students of Stanford University (ASSU) will offer fall quarter classes especially tailored to appeal to faculty, staff, and the local community as well as to students.

Class descriptions follow:

Bartending, taught by Marty Weiner, teaches all you need to know to be a professional bartender, a portable skill that allows you to work wherever you choose to live. First meeting is 3 p.m. Thursday, Oct. 7, in Room 48, Old Chemistry Bldg.

Ballet, taught by Laurie LaBerge (851-4297). Beginning classes will start at 4 p.m. Thursday, Sept. 30, and Tuesday, Oct. 5. Intermediates will start at 1:15 p.m. Friday, Oct. 1, and 5:30 or 6 p.m. Monday Oct. 4 (classes and times may change). The fee is $39 for 10 weeks.

Belly Dance Club, instructed by Samara (321-8964). First meeting is 6 p.m. Wednesday, Oct. 6, in the Old Union Clubhouse ballroom. Fee is $5 per 1 1/2 hour class.

Balkan Dancing, taught by John Nicoara, will meet at 7:15 p.m. Thursday nights beginning Oct. 7 in the Old Union Clubhouse ballroom. Fee is $17 for 10 weeks or $2 per week.

Robin Clute will teach three cooking classes at Bechtel International Center (sign up beforehand in the ASSU business office, 497-4331).

All About Tofu. 10 a.m.-2 p.m. Saturday, Oct. 30, will show how this low-cost, low-fat, low-calorie wonder food can be used in all sorts of Western dishes; $6 per person.

Super Soups. 10 a.m.-1:30 p.m. Saturday, Nov. 13, $6 per person.

A Vegetarian Sampler. 7-9:30 p.m. Tuesdays, Nov. 16 to dec. 7, $20 per person.

Each week will cover a different aspect of meatless cooking and nutrition -ideas for better breakfasts, secrets of whole-grain baking, vegetarian nutrition and meal planning, and cooking with fresh vegetables.

YWCA has classes for adults, kids

The Stanford YWCA will continue its program of classes for adults and children during fall quarter.

Classes for adults in the Clubhouse include morning dance exercise to music with Elizabeth Larkam, and noon aerobic fitness with Meredith Einaudi.

Art, dance, tennis, and cooking classes will be taught at Escondido Village.

Afternoon classes for children have been scheduled in art, dance, and several sports.

For more information or a brochure, call 497-1101 between 9 a.m. and 1 p.m. Classes begin the week of Oct. 4.

For better tennis...

Tennis lessons (six pupils per group) will again be offered to graduate students, staff, and/or their families on weekday mornings *or* Saturday mornings.

Players are grouped by ability in these classes taught by Dick Gould's staff. Call 497-1160 on weekday mornings to receive detailed printed information and registration form. Lessons begin the week of Oct. 9.

The successful Nimitz Run finishers are, from left: leader Lindy Birkel; Melodye Khattak, Alda Wells, Cindy Cramer, Maureen Novotny, and Roberta Johnson

Walk, jog, run, or swim—the HIP will help you get started this fall

Five Stanford staff members successfully completed the 5 kilometer (3.1 mile) Nimitz Run held on Treasure Island last May.

What's so unusual about running in a local Fun Run?

These women started training only seven weeks before the race, and many of them had never jogged before.

They began in one of the Health Improvement Program's (HIP) walk/jog classes, mostly walking during the first few sessions. They met three times per week, developed a spirited commitment to complete the Nimitz Run *without* walking, and they were successful.

Training to complete a running race is good incentive to become fit; however, not all HIP exercise participants choose this as their goal. Many simply want to learn new exercise skills in a comfortable atmosphere, and for many, exercising is simply a good break from work.

Other potential benefits include effective weight loss, cardiovascular improvements, better carbohydrate metabolism, improved muscle tone and perhaps most important, a greater sense of well-being.

HIP classes offer an opportunity to improve fitness in several ways, including aerobic dance, walking, jogging, running, swimming and calisthenics. An advantage is that classes are structured to accommodate all levels of ability and are offered on campus at convenient times for staff and faculty.

Faculty and staff members and their spouses are invited to join the program for a fee of $5. Classes will be taught by experienced exercise leaders, with several sessions offered quarterly.

Fall meeting times and places are:

Walk/jog/run at Roble Field—Sunrise Exercise MWF 6:45-7:30 a.m. or the Healthiest Lunch Break Around, MWF 12:10-12:50 p.m. beginning Monday, Oct. 4. Each session begins with a 10-minute warm-up, then participants divide up into groups.

The walking group—people who want some aerobic activity but not interested in jogging—typically circles Lake Lagunita or makes a trip to the golf course and barn during one 30-minute session.

The beginning jogging group combines walking and jogging, with a goal of jogging more and walking less as the class continues. The group usually develops the ability to complete one of the several scenic golf course routes during the sessions.

The jogging and running group participants jog or run continuously throughout the 30-minute session. The difference between the two is the distance covered.

Swimming at DeGuerre Pools—Noon to 1 p.m. beginning Monday, Oct. 4. Instructors Corinne Powell and David Schrom help people of any ability with individual instruction as participants swim at their own pace. Nonswimmers and those who are uncomfortable in the water are particularly encouraged to join.

To join any of these HIP classes, send name, ID mail address, campus phone number, choice of class, and a check for $5 made payable to Stanford University to HIP, 730 Welch Rd., Suite B. For more information, call HIP at 7-7940.

ISL plans first grad orientation

The Information Systems Laboratory (ISL), in the Electrical Engineering Department, is planning an orientation for its new graduate students.

It is the first time a two-week formal orientation will take place. The activities have been coordinated with those provided by the EE Department, I-Center, and graduate Student Association.

The main objective of the orientation is to encourage communication and participation between the students. The Lab is expecting some 60 new M.S. students and 6 Ph.D. candidates.

The program starts Monday, Sept. 27, with a breakfast and welcoming speeches by Prof. Joseph Goodman, director of ISL, and Juan-Manuel Jover, graduate student and coordinator of the orientation.

Other events scheduled for the first week are: panel discussions about the courses, research areas, etc. Several social events are being prepared, like lunch Sept. 28, an evening at the Coffee House or a dinner in a local restaurant on Saturday, Oct. 2.

The second week concentrates on a tutorial about the ISL computer system. Orientation finishes Friday, Oct. 7, with the traditional ISL wine and cheese party.

The Electrical Engineering Department also organizes other activities: fellow students will be available Sept. 22-24 to help incoming students; a party on Friday, Sept. 24; and an introduction to all of its six labs during the week of Oct. 11-15.

Grateful Dead comes to Stanford in October—get your tickets now

The Grateful Dead will usher in what is hoped will be a new, more successful era of rock concerts at Stanford when they perform in Stanford's Frost Amphitheater at 2 p.m. Oct. 9 and 10.

Co-sponsored by *Chaparral*, the campus humor magazine, and Bill Graham Presents, the performances will be the first rock concerts at Stanford since the Jefferson Starship appeared in 1980.

The sponsors and University officials hope to avoid the financial problems that have plagued the production of rock concerts at Stanford in the past.

The performances were discontinued in 1980 when ASSU Special Events, the student organization that had sponsored them, was disbanded. Declining attendance and the rising cost of producing the concerts caused Special Events to lose about $125,000 that year.

This has prompted the Dean of Students Office to create the Committee on Contemporary Entertainment (COCE), which helps student organizations co-produce concerts with professional promoting companies like Bill Graham Presents.

The Grateful Dead, known as The Warlocks when they first began playing at San Francisco coffeehouses in the 1960s, came to national prominence through their performances at the 1967 Monterey Pop Festival and at Woodstock in 1969.

Several of their albums have sold more than 1,000,000 copies, including *American Beauty*, *Live/Dead*, *Terrapin Station*, and *Workingman's Dead*, which included two of their most popular songs, "Truckin" and "Sugar Magnolia."

The six-member band includes Jerry Garcia, Bob Weir, Phil Lesh, Billy Kreutzmann, Mickey Hart, and Brent Mydland.

Tickets for the concerts, the Grateful Dead's first at Stanford in more than a decade, go on sale at all BASS outlets Sept. 12. They are $12 in advance and $13.50 at the gate.

Tickets for Stanford students, who will receive a $1 discount, go on sale at Tresidder Box Office Sept. 28.

Music Department's David Burkhart and friends open concert season

David Burkhart, Stanford's lecturer in trumpet, opens the Music Department's fall concert series at 8 p.m. Friday, Oct. 1, in Dinkelspiel Auditorium.

Burkhart will be joined by Deborah Shidler, oboe; Greg Barber, bassoon; Nancy Kelley Sheng, piano; and Vicki Riley, organ.

The program will include the first performance of Fiala's *Divertimento for trumpet* in a new edition by Burkhart, Krol's *Fantasia notturna* for piccolo trumpet and organ, *Concerto in C minor for oboe* by Telemann, a transcription of Ravel's *Alborada del Gracioso* for bassoon and piano, Biscogli's *Concerto for trumpet, oboe, and bassoon*, and Roland-Manuel's *Suite dans le gout espagnol* for trumpet, oboe, bassoon, and piano.

Burkhart is principal trumpet with the Oakland Symphony and a member of the Arch Ensemble for Experimental Music and the Classical Brass Quintet. He is a recent winner of the California Young Artists' Competition.

Burkhart received his B.A. and M.M. from Yale. He then joined the Jerusalem Symphony as principal trumpet. While in Israel, Burkhart also played with the Jerusalem Brass Quintet and taught at the Rubin Academy of Music.

Tickets are $4 general, ($2 students and senior citizens), available at Tresidder Ticket Office (497-4317) and the door.

Auditions set for all music groups

Stanford's Department of Music will hold auditions for all its performing groups Monday and Tuesday, Sept. 27 and 28, on campus.

Community members are encouraged to audition. For information regarding specific times and locations, call the Department of Music, 497-3811.

The department's performing groups include Chorale/Chorus/Church Choir, Marching Band/Jazz Band/Wind Ensemble, Symphony & Chamber Orchestra, Early Music Singers, Renaissance Wind Band, and Percussion Ensemble.

Alea II, the ensemble for new music, will hold auditions Tuesday, Oct. 5.

Computer search demonstration set

Demonstrations of computerized literature searching will be part of a campus-wide orientation by the Science Department Libraries of the Stanford University Libraries at 10 a.m.-12 noon and 1-5 p.m., Tuesday, Sept. 28, in Skilling 193.

One may attend at any time, but different disciplines within the sciences will be emphasized at the following hours: life sciences. 10-11 a.m.; chemistry, 11-12 a.m.; engineering, 1-2 p.m.; earth sciences, 2-3 p.m.; mathematics and physics, 3-4 p.m.; and computer science, 4-5 p.m.

This will be an opportunity for those attending to learn more about the collections located in the seven branches which make up the Science Department Libraries of SUL; Engineering, Branner Earth Sciences, Physics, Mathematical and Computer Sciences, Falconer Biology, Swain Library of Chemistry and Chemical Engineering, and Hopkins Marine Station Library.

Other science collections on campus which are also of interest are located at the Green Library, Lane Medical Library, and SLAC Library.

There are over 100 data bases available for online searching. In the sciences, this includes chemical abstracts, engineering index, conference papers, biological abstracts, physics abstracts, dissertation abstracts, georef, geoarchive, computer and control abstracts, patent indexes, and science citation index. The Research Libraries Information Network—RLIN II—and the SLAC high energy physics data base and other files will also be shown.

Trustees OK three concepts for below market rate housing

Stanford Trustees have approved three major "concepts" under which the University could participate in Palo Alto's Below Market Rate (BMR) housing program as part of the proposed Stanford West housing project.

The first is that 15 percent of the projected 1,500 units on two parcels of Stanford land along Willow Road within Palo Alto will be made available at below market rates through the use of pricing mechanisms.

The second is that at least 60 of the BMR units would be dedicated to the city's BMR program participants—people on the city's waiting list for such housing.

The third is that Stanford would lease the Mayfield School site on El Camino Real to the city for $100,000 for BMR rental housing. The development would revert to the University at the end of a 35-year lease period. In addition, Stanford employees now excluded from the city's BMR program because they neither live nor work in Palo Alto would be eligible for housing elsewhere in the city.

The "concepts" were worked out through discussions between the University and city staff members.

Under Palo Alto's comprehensive plan, at least 10 percent of housing developments of 10 or more units must be provided to low and moderate income families. Larger projects are expected to devote a greater percentage to that purpose.

If a 1,500-unit project were to be approved by the city, 225 of the units thus would be below market rate. The city's share of the 225 would be based upon the percentage of non-Stanford residents in the market-rate units. That share would be 10 percent of the non-Stanford units, or 60 units, whichever is greater.

Stanford estimates that, over time, one third of the project households could be non-Stanford affiliated. If that were the case when the project opened, 50 of the units would be earmarked for Palo Alto. Under the concepts approved by the Trustees, however, at least 60 would be assigned.

Under these concepts, Stanford would retain the bulk of the BMR units it provides, and its employees would have access to the city's other BMR projects. The city in turn would gain at least 60 units and would lease the 4.2—acre Mayfield site at extremely low cost. The land is estimated to be worth about $3.5 million.

The site is north of Page Mill Road. It was leased by Stanford to the Palo Alto Unified School District for one dollar a year from 1923 until last February. The school was closed in 1966.

Stanford is making the site available to the city at the same price that the University paid the school district to terminate the lease.

Palo Alto has rezoned the property for multi-family use. The city has until the end of 1985 to obtain approval of housing on the site, or by the completion of "rough inspections" of the first Stanford West units, whichever occurs latest.

The Stanford West Environmental Impact Report will be taken up by the Palo Alto Planning Commission on Oct. 13. The proposal consists of 1,275 units on a 46-acre site between Willow Road and San Francisquito Creek, and 194 units on a 4.3-acre site at the corner of Willow Road and Pasteur Drive.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next Calendar deadline is Wed., Sept. 22 to cover the week of Mon., Oct. 4 through Sunday, Oct. 10.

LATE ANNOUNCEMENT

Wed., Sept. 22. Structural Biology Dept. Lecture: "Structure of the Type I Collagen Fibril" by Dr. Karl Piez, director, Connective Tissue Research Laboratories, Collagen Corp. Noon. Fairchild Bldg., Room D-102.

MONDAY, SEPTEMBER 27

Varsity Soccer: Vs. Brigham Young Univ. 2 p.m. Maloney Field.

TUESDAY, SEPTEMBER 28

Stanford Savoyards Auditions: For "H.M.S. Pinafore" by Gilbert & Sullivan. Singers for lead roles and chorus should come prepared to sing a song of their choice. Orchestra members and technical crew should stop by to sign up. Anyone interested in working in any capacity, please drop in. 7-9:30 p.m. Dinkelspiel Aud. Production dates, Nov. 12-14, 19-20. (Auditions also tomorrow, same details.)

ASSU Flicks: "Chariots of Fire." 7 & 9:45 p.m. Memorial Aud. $1.50.

Science Libraries Annual Orientation: Demonstrations of computerized literature searching 10 a.m.-noon, 1-5 p.m. Skilling 193. Science librarians on hand to discuss library programs, services and policies. Different disciplines emphasized at these hours: life sciences 10-11 a.m.; chemistry 11 a.m.-noon; engineering 1-2 p.m.; earth sciences 2-3 p.m.; math and physics 3-4 p.m.; computer science 4-5 p.m. Open to all. Detailed information at 497-0864.

WEDNESDAY, SEPTEMBER 29

Varsity Soccer: Vs. Sacramento State. 2 p.m. Maloney Field.

Stanford Savoyards Auditions: See details for Mon., Sept. 27.

Colloquium of the Dept. of Chemical Engineering: "Thermal Cracking for Olefins Production" with Dr. G. F. Froment, Univ. of Ghent, Belgium. 4:15 p.m. Chemical Engineering Conference Room.

THURSDAY, SEPTEMBER 30

Condensed Matter Physics Seminar: "Spectroscopic Studies of the Interaction of Cl with Zn—O Surfaces" with E. I. Solomon, S.U. 4:15 p.m. Applied Physics 200.

Stanford Arms Control and Disarmament Forum: "The Civil Defense Controversy—a Public Debate." A film, "Protection in the Nuclear Age," followed by the debate with panelists Beverlee Myers, Loren Fields, Sidney Drell. 7:30-10:30 p.m. Kresge Aud. Public cordially invited.

Yoga Discussion Series: "The Science of Yoga" with Rene Ochoa. 7:30 p.m. History Corner, Room 217. Open to all.

FRIDAY, OCTOBER 1

Water Polo: NorCal Tournament. All day. deGuerre Pool.

Applied Mathematics Seminar: "Dynamic Dislocation Pileups" with Prof. Hilary Ockendon, visiting S.U. from the Univ. of Oxford. 3:15 p.m. Room 380-C (Mathematics Corner Basement).

SATURDAY, OCTOBER 2

Water Polo: NorCal Tournament. All day. deGuerre Pool.

Varsity Football: Vs. Oregon State. 1:30 p.m. Stanford Stadium. Ticket information at 497-1021.

SUNDAY, OCTOBER 3

University Public Worship: Student Worship Service, 8:30, a.m.; Robert G. Hamerton-Kelly, dean of the chapel, sermon and eucharist, 11 a.m.; Catholic Mass, 4:30 p.m.

ASSU Sunday Flicks: "On Golden Pond." 7 & 9:30 p.m. Memorial Aud. $1.50.

EXHIBITS

Paul Harris—Still Life. Stanford Museum. Sept. 28-Jan. 2.

Water Wholes. Color photomurals by Benjamin W. McKendall, Jr. International Center. Through Sept. 29.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through Nov. 5.

Handwoven Tapestries by Anton Grubman. Tresidder Union 2nd floor gallery. Through September.

Stanford Arms Control and Disarmament Forum: "The Civil Defense Controversy—a Public Debate." A film, "Protection in the Nuclear Age," followed by the debate with panelists Beverlee Myers, Loren Fields, Sidney Drell. 7:30-10:30 p.m. Kresge Aud. Public cordially invited.

CAMPUS REPORT

Volume XV, Number 2 | A publication for Stanford University faculty & staff | September 29, 1982

REGISTRATION was carried out directly on computers Monday and Tuesday, and before procedures were worked out fully, students waited in line for as much as two hours before their turns came up. Someday—the ideal system.

Long-term faculty affirmative action urged

Faculty affirmative action should remain an active process for at least a decade at Stanford, a new committee report recommends.

Headed by Prof. Arthur I. Bienenstock, the Committee on Faculty Affirmative Action said the Stanford situation "is not a good one," even though the University "for the most part has hired women and minority group members over the past eight or nine years at a rate which is equal to or greater than what would be expected on the basis of national Ph.D. conferral rates.

"What's more, the junior faculty among them have been retained with tenure at a rate which is equal to or greater than that for white males. . . .

"(But) there are just not enough women, black, or chicano faculty, tenured or nontenured, at this University to meet its perceived needs" for student advising, special services, and community requirements.

"Hiring rates are low and we have a long way to go before we have sufficiently large numbers so that a woman, black, or chicano faculty member can devote his or her time almost exclusively to teaching or scholarship for a year or two and still assume that other University needs. . .are being met," the committee said.

To continue a long-term effort, the committee recommended that departmental faculty affirmative action officers constitute a new Faculty Affirmative Action Board, meeting at least quarterly, and that a new University Committee on Faculty Affirmative Action serve as its executive committee.

The faculty Committee on Committees currently is considering a list of potential appointees to the executive committee, whose formation has the support of President Donald Kennedy.

The departmental faculty affirmative action officers should work closely with

Mediation effort resumes as strike enters 20th day

Mediation will resume between United Stanford Workers and the University at 10 a.m. Wednesday, Sept. 29, with federal mediator Dorothy Christiansen in an attempt to settle the strike of technical, maintenance, and service employees, now in its 20th day.

The return to mediation was requested by Michael Baratz, executive secretary of Local 715, who said Friday that "President Kennedy said this should be resolved at the table, so we're going to take him up on that. We hope the University will come prepared to settle the dispute. We're prepared to stay there day and night to resolve this."

An earlier session Sept. 17 ended in a deadlock.

The University released a statement Sunday saying the strike had not been necessary and that the University "would have continued negotiating in good faith and would have worked hard to reach agreement with or without a strike." The University "will settle only on terms that it believes it can responsibly approve. . . ."

The statement also says "the purpose of the (University's final) offer was to alert the union to the fact that the University's ability to make further major compromise was exhausted and to provide the union with a clear and candid indication of the University's viewpoint. Obviously the University was signaling that it would accept anything reasonably close to its offer. Equally obvious, the University would not accept proposals that are as excessive as those the union has been making during the strike." *(See text, p.20.)*

Stanford first in comp sci, statistics

Stanford ranks first nationally in the perceived quality of its faculty in computer science and tied for first in statistics, according to a major new national survey.

In the four other fields covered by the study, Stanford ranked sixth nationally in chemistry, mathematics, and geosciences, and tied for seventh in physics.

Sponsored by the Conference Board of Associated Research Councils, including the American Council of Learned Societies, the American Council on Education, the National Research Council, and the Social Science Research Council, the $500,000 two-year study was funded by the Mellon, Ford, and Sloan Foundations, the National Institutes of Health, the National Science Foundation, and the National Academy of Sciences.

California Institute of Technology ranked first in geosciences and tied for first in chemistry and physics. UC-Berkeley tied CalTech for first in chemistry and Stanford for first in statistics. Harvard tied CalTech for first in physics and chemistry. Princeton ranked first in mathematics and MIT shared top billing in chemistry.

In general, the reported differences among top-ranked institutions appeared quite small.

The evaluations were based on a survey of 1,155 math and sciences professors, or about eight percent of all professors in these fields.

The report gave two figures for scholarly quality. The first number was the raw score ranging from 0 to 5 on a scale where 4 was "strong" and 5 "distinguished." The second figure transposed the raw scores onto a scale of 1 to 99, with 50 representing the average and about two-thirds clustered between

People

Prof. Katharina Mommsen, German studies, presented a paper on "Lyrical or Theatrical Creativity? Young Hofmannsthal at the Crossroads" at the University of Toronto at the Conference "Vienna at the turn of the century"; a paper on "Goethe's Views on Women—A Modern Perspective" at the Carleton University and the Goethe Institute (both in Ottawa); and a paper on "Goethe als Wegbereiter der Frauenemanzipation" ("Goethe Paving the Way for Women's Liberation") as guest lecturer of the Goethe-Gesellschaften in Darmstadt, Hannover, Kiel, and Stuttgart, as well as at the Bonn and Munich Universities.

On the occasion of the 150th anniversary of Goethe's death Mommsen published a small volume, translated by Leslie Willson, entitled *Who is Goethe?* which compiles quotations of his works and documents from his life. Her book *Goethe and 1001 Nights* was published in Arabic by the University of Damascus.

As a guest of the German Academy for Language and Poetry (Deutsche Akademie fur Sprache and Dichtung) Mommsen read the leading part in a public reading from Goethe's tragedy "Die naturliche Tochter" ("The Natural Daughter"). At the conference of Chinese Germanists from the People's Republic of China she gave the lecture of the opening ceremony on the topic of "Goethe and China—China and Goethe" in the Alte Aula (The Old Auditorium) of the University in Heidelberg.

In the Yearbook for International German Studies (Internationale Germanistik) she opened with Prof. Jutta Goheen/Ottawa, the discussion on "The Role of Women in German Literature and Language."

President Donald Kennedy of Stanford has been elected a member of the Conference Board for a two-year term.

Founded in 1916, the Conference Board is a global network of leaders who exchange information on management, economic and public policy issues.

The Stanford Business School office of MBA admissions has announced appointment of two new admissions officers.

Named assistant director of admissions is **William H. White III**, 35, who has been associate director of admissions at the Johns Hopkins University since 1979. He replaces Emily Canales.

White, who joined the staff September 13, will direct the Business School's minority recruiting program, participate in the general recruiting and evaluation of applicants, and assist in directing the admissions office staff. He holds a B.S. degree in business and industrial communications from Emerson College in Boston.

Appointed admissions officer is **Deborah L. Henken**, 24, who received a Master of Management degree from Northwestern University's J. L. Kellogg Graduate School of Management in June of this year. She joined the staff August 2. Henken will participate in general recruiting, interviewing and evaluating of applicants, oversee production of admissions office publication materials, and handle placement of applicants in the School's guaranteed admission program.

White and Henken will report to Kathleen Gwynn, director of admissions.

News Service science writer **Joel Shurkin** will teach a California Publishing Institute (Palo Alto) seminar on science writing on Thursday evenings this quarter, beginning Sept. 23.

Shurkin, who shared a Pulitzer Prize for the Philadelphia *Inquirer's* coverage of the Three Mile Island incident, has been a Stanford staff member since 1980.

Luis L. Arroyo, associate professor of history at the University of California, Davis, has been appointed visiting professor of history at Stanford for 1982-83 by the Chicano Fellows Program and the History Department.

The Chicano Fellows Program consists of one visiting faculty member and two chicano graduate fellows. Its purpose is to provide undergraduate instruction for chicano students while simultaneously contributing to the career development of the two fellows.

As visiting professor, Arroyo will offer three undergraduate courses, two as introductory courses to chicano studies and the third as a disciplinary course with a focus on chicanos. The classes are intended to establish a core set of courses for chicano studies.

His second major responsibility will be to work closely with the two fellows, who have yet to be named, including coordinating their roles as teaching assistants and advising them on their respective degree programs.

Arroyo earned a B.A. in philosophy (1970) and an M.A. in modern European and modern Latin history (1973) from the University of California, Santa Barbara. He received a Ph.D. in recent U.S. history with an emphasis on chicano and labor history from UCLA in 1979.

A native of San Fernando, Arroyo has published several papers on chicano and labor history, including "Labor and the Development of the Chicano Working Class," (1980), and "Changes in the Attitudes and Practices of Organized Labor Towards Mexicans: Los Angeles, 1900-1935," (1979).

Dr. Carolyn C. Lougee, associate professor of history at Stanford University, has been appointed a member of the Advanced Placement European History Development Committee of the College Board for the year commencing July 1, 1982.

This committee is responsible for developing examinations that the Board offers through its Advanced Placement Program. The committee's charge includes specifying the kinds of knowledge and skills to be measured, writing and reviewing examination questions, helping to communicate information about the examinations to those using or affected by them, and advising on related policies and services.

A member of Stanford's Internal Audit Department has received two honors for his research in anthropology and education.

David M. Fetterman, a senior internal auditor as well as a regular guest lecturer in the Anthropology Department and School of Education at Stanford, is a winner of the 1981 Praxis Publication Award international competition, sponsored by the Washington Association of Professional Anthropologists.

His ethnographic study of an alternative high school program for dropouts was cited as a "concrete example of the successful application of anthropological knowledge to 'real world' problem solving."

Fetterman has also been elected to the New York Academy of Sciences "on the basis of his scholarly contributions to the scientific community."

Formerly a senior associate and project director at the RMC Research Corporation, Fetterman has conducted other research in migrant education, medical anthropology, and education for gifted students.

Prof. Clara N. Bush succeeds Hutchinson as academic secretary

Prof. Clara N. Bush, a leader in developing linguistics and special language programs at Stanford, has been named Academic Secretary of the University, effective immediately, President Donald Kennedy has announced.

Head of the Department of Linguistics from 1973 to 1980, Bush has served on a wide variety of committees, including those concerned with the Honor Code and foreign language proficiency requirements.

The Academic Secretary plays a central role in coordinating committee work and meetings for the Faculty Senate and the Academic Council. Bush succeeds Prof. Eric Hutchinson, who served eight years in the position.

Bush has a "strong interest" in the way faculty participation in University governance has grown over the years. "It's been remarkable," she says.

Bush has been at Stanford since 1956, when she started work on her Ph.D. in acoustic phonetics. After earning the degree in four years, she was named director of the program in English for foreign students, a position which eventually put her in touch with a wide variety of schools and academic departments.

Her first few weeks in her new job already have provided "an even better feeling of what the whole University is about," she says. "This is truly a University-wide resource office."

Like Hutchinson, Bush plans to continue teaching. This fall, she will teach a course in phonetics. According to the *Associated Students Course Guide*, students have found her lectures "very clear" and "helpful. . .all in all (her) course received widespread praise and little or no complaints."

During winter and spring quarters, she will teach a freshman seminar on errors and what they reveal about language and how the brain functions. "Slips of the tongue, eye, ear and hand are not random," she notes. "They shed significant light on how we process language."

Bush had planned to be a freshman adviser this fall, but postponed this because of her new responsibilities.

A graduate of Western Michigan University and the University of Michigan, she taught for a decade at WMU before coming to Stanford.

Her initial work in teaching English to foreign students concentrated on spoken English and on understanding lectures. Then a writing component was developed, and more specialized programs created for such fields as engineering and law. Eventually EFS became part of Linguistics.

Starting in the early 1970s, Bush followed with Prof. Charles Ferguson in directing the Special Language Program in Linguistics, a program which had developed in response to student requests and initiatives. Now, each year, small groups of students study 20 to 25 different languages, ranging from Norwegian and Czech to Korean, Navajo and American Sign. "This is very challenging," Bush says. "Quality control is difficult. But it's better to try than to ignore students' interests."

She has warm praise for Hutchinson. "Eric left 40 pages of handwritten script about his experience as Academic Secretary which are absolutely invaluable.

"He's also available to answer questions, while so many details remain fresh in his mind. That's an immense help."

Bush's selection was recommended by a search committee headed by Prof. Halsey Royden, former dean of humanities and sciences. Profs. James Gibb, anthropology; Ronald Rebholz, English; and Robert Street, engineering, were members.

Her first session with the full Faculty Senate comes at 3:15 p.m. Thursday, Sept. 30, when it holds its opening meeting of the new academic year at the Law School.

The Academic Secretary's Office is located in Building 170, Room 105, behind the President's Office Building. Phone 497-4991.

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.

Published by the Stanford University News Service. Patricia J. Black, editor; Karen Marman, design assistant, Charles Painter and Ed Souza, photographers; Medical news editor, Lisa Ames.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at address below. POSTMASTER: Send address changes to *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

Jeff Ullman works for tenfold increase in computer speed

BY DONALD STOKES

Prof. Jeffrey D. Ullman is writing a book in daily collaboration with coauthors 3,000 miles away, but almost every morning they consider each other's contributions as soon as they are written. It is all done with display terminals.

The book is about data structures and algorithms (methods of solving problems).

This is appropriate, for Ullman, professor of computer sciences at Stanford, is one of the small band of theoreticians who are preparing the way for the next generation of computers.

Ullman has made fundamental contributions in the areas of automata theory, computational complexity, compiling and relational database theory.

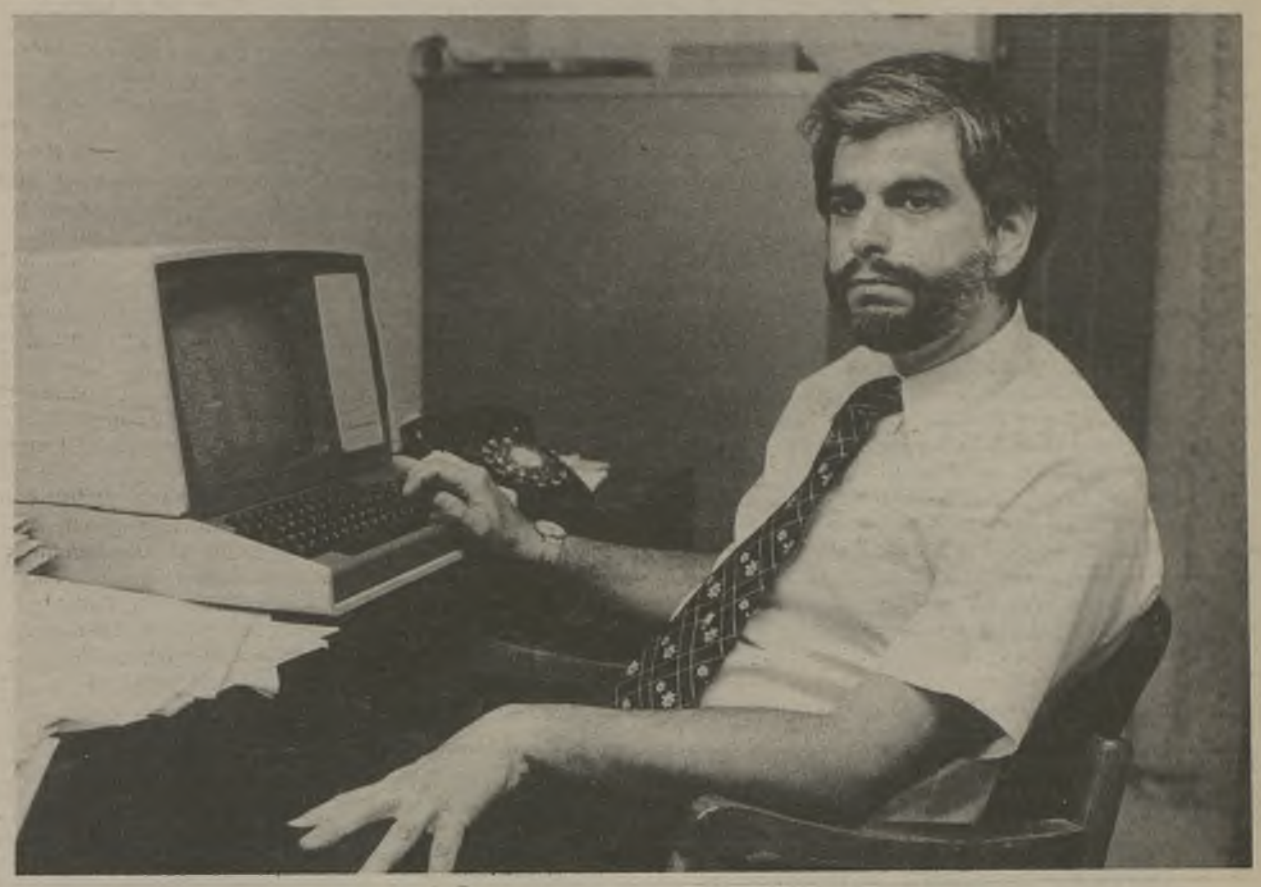
He has developed powerful algorithms for code generation (the problem of converting high-level computer language into instructions that the machine can understand) and code optimization (the problem of automatically transforming a computer program so as to make it run faster or use less storage).

More recently he has become interested in applying some of the same concepts to the design of integrated circuits.

"In a sense I have come full circle, for circuit design is what I began work in more than 15 years ago," said Ullman. "Stanford is the national center for this type of work, and it was natural to get involved in it when I came here three years ago.

"The size of the circuits having shrunk, the amount of logic that can go into a design is now a thousand times greater than when I was a student."

Ullman believes that many important computational tasks can be speeded up by factors from 10 to 30 by replacing the micro-processor with specially-designed chips.



"If we are successful in our goals to provide high-level design facilities for integrated circuits, we should be able to build chips with no more effort than it takes to write a program for the micro-processor.

"Instead of programming the computer to do something, we go out and in roughly the same time it takes to create the program, we make a chip that is guaranteed to perform the role specified by that program.

"Several difficulties lie in the way of these goals. The first is that chips the size of a micro-processor are so hard to design that there is considerable delay while the work is going on.

"At the moment it is too costly to design a chip for some random task. That is why generally we use the micro-processor, which is itself the product of monumental labor, and program it to perform that task.

"We know how to process high-level language into code, but we do not yet know how to convert high-level descriptions into high-quality circuits."

In a sense I have come full circle, for circuit design is what I began work in more than 14 years ago. Stanford is the national center for this type of work, and it was natural to get involved in it when I came here three years ago.

—Jeff Ullman

Some of Ullman's work is presently concentrated on compiling high-level descriptions of what circuits should do, trying to achieve a compact representation of the circuits.

Has he made any breakthroughs?

"I think we have made some slow improvements. By developing certain optimization techniques we have gotten the quality of the circuits improved by a factor of, say two, in other words to half the size of when we started doing these projects. Ours is really a series of small changes rather than any sudden big ones.

"In this field, like the others I have worked in, there is still the same opportunity to help the user—in this case the circuit designer—get away from the need to deal with every little wire.

"However, there is the usual trade-off between ease of use versus quality of result. If you give the designer high-level primitives he does not tend to get as good a design from your system as he would from a system using low-level primitives.

"The area of a design often turns out to be critical. Thus, developing good systems that support design with high-level primitives is tough work."

Ullman's second important project involves providing users with easy and rapid access to large data bases, in a language that is reasonably close to the way they speak and write. The common theme between the two projects is making life easier for the user by having the computer do more of the work.

"I should like to see a large increase in user-friendly interfaces, ones that can be used without warping one's thinking" he said.

"The particular direction we are taking now is the implementation of a 'universal relation' interface where the user sees data, no matter how complex, as if it were stored in a single table.

"The user states what elements he wants connected, e.g. 'retrieve shirtsize where employee—Jones.' The machine must deduce what the likely connection is between shirtsize and employee, in the data as structured in the computer.

"For example, does the company record each employee's shirt-size, or are different sizes of shirts sold in different departments, and are we then asking for the sizes sold in Jones' department?"

Soon after Ullman arrived at Stanford it became clear that new ways were opening up to manage large amounts of data in such ways that answers could be produced relatively quickly. He became interested in what became known as 'the relational model.'

"This model allowed some nice mathematical solutions to some fundamental problems of database design.

"But, as with translating high-level circuit descriptions into chips, there is an optimization problem. The relational model gave much higher levels of constructs to the user, but translating his queries into operations on the database became more difficult than with earlier models of data."

Ullman and his colleagues worked on these problems and made a number of advances. They carried out work in what became known as 'universal relations.' In effect, this carried the relational model one step further.

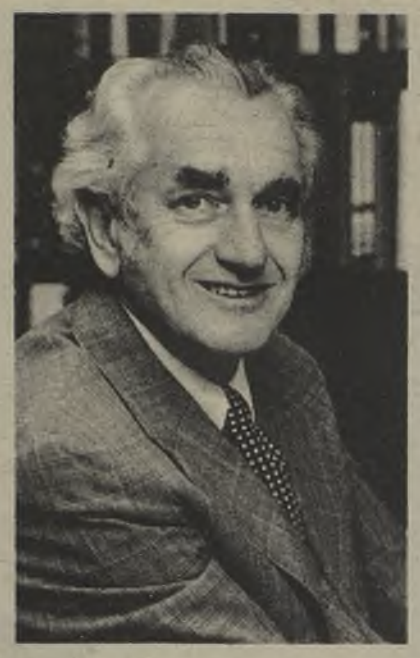
"The nice thing about the relational model was that it relieved the user of certain 'navigational' problems said Ullman. "Instead of phrasing queries (requests for data) in terms of the way data was stored in the computer, the user queries about relations (tables) of data.

"Just as the relational model avoided forcing the user to navigate with the data in the computer, the 'universal relation' system we are building tries to save him the trouble of navigating among the relations.

"Part of the mathematics we are developing is designed to model what is natural, to see what people see as natural in a given situation, and what they do not. We are trying to set up structures that model the ways in which people naturally think about a real-world situation, so that the system can respond in the expected way.

"It is very pleasant to see how much mathematics is necessary to make headway against problems like these."

Ullman does not like to use anthropomorphic words about computers which imply that they can think.



"That is the wrong image," he said. "When we produce better algorithms—perhaps ways for the machines to search for the right way to proceed—they will produce better results, but probably they will never 'think' about it in the accepted sense of the word.

"Probably in several hundred years there will be machines that behave like Seethreepio, but at the moment such things belong in the realm of science fiction.

"I think you will find that even most scientists who deal in what is called 'Artificial Intelligence' don't think in terms of creating 'thinking machines' but rather in discovering good ways to perform specific operations such as reasoning formally about

Carl Degler: History's being redefined to include women's interests

Carl Degler

Undoubtedly, it will take many years for scholarly disciplines to be redefined to include women's interests as integral elements.

Following is an essay by Stanford history Prof. Carl Degler, which appeared in the Sept. 15 issue of The Chronicle of Higher Education.

For most people who favor affirmative action in hiring at colleges and universities, the goal seems clear: to increase equality of opportunity. In actuality, however, for women, much more is implied than that.

Unlike minorities, women are not only as numerous as men; they also differ from that dominant group more profoundly than any minority. Because of those differences, affirmative action for women must have a deeper effect upon fields of scholarship. It will, if it is achieved, literally reshape the content and meaning of many if not all disciplines.

It is quite true, to be sure, that over the last century or so, in the course of which women entered academe for the first time in force, they adapted to, rather than changed, the fields they entered. Since the professions and academic disciplines had been defined, not to say created, over the centuries by men, adaptation was essential. Indeed, it was on that basis that women are allowed to enter the disciplines at all.

Today, however, with the new self-consciousness among women, many of them are beginning to see their scholarly interests and concerns as different in some ways from those of men. They ask of history, literature, and even economics: How does this field relate to me as a woman? For, where values are intrinsic to a discipline, as they certainly are in the humanities and social sciences, it is inevitable that personal or group identities will shape how one thinks about a subject.

In my own field of American history, the effect of this self-consciousness has already become evident. A number of senior female historians who entered the profession and achieved tenure working on subjects that were unrelated to women are today turning out books about women. As their consciousness has been raised, they have asked the fateful question: Where am I, where are women, in my discipline?

The same development can be seen in the growing number of female graduate students in American history who want to work on aspects of the past related to women. At Stanford University this year, of the five top female candidates for admission in American history, four specifically expressed an interest in women's history. Among undergraduates, the strong interest among young women in courses in women's history and literature and in women's studies in general testifies to the consequences in education of the new self-consciousness among women.

If one thinks about it, the concern of women with their interests and values is quite natural and to be expected. Where it presents a problem is in that the academic fields, as they have been defined over the centuries, are not prepared to recognize as legitimate these peculiarly women's concerns. After all, men have defined what it means to be human and what are proper scholarly concerns of human beings.

Yet what we have been forcefully taught over the last decade or so is that women's conception of humanity is not necessarily identical to that of men, and that therefore the ways of studying human beings may not be the same when women's interests and concerns are acknowledged and included.

The differences between women's and men's views of the past are already quite clear. The most obvious is that very few men do research in women's history; apparently men do not see it as legitimate or important. A second sign is that women are introducing novel aspects of the past into the history they write, aspects that few men have been concerned with in the study of the past, and that even today are not seen by many men as legitimate subjects for scholarly inquiry.

The history of sexuality is a case in point. Only since the advent of women's history has the subject of sexuality been studied historically in a serious manner. That it has been discussed at all is clearly related to women's special character and difference from men. For sexuality is to women as color or race is to blacks: a source of difference from the dominant group and therefore a source of possible oppression.

Other subjects, equally sex-related, such as the history of childbirth, experiences with war and social aggression, the character of families, and the uses of power, will undoubtedly be explored in new ways as women become increasingly active and prominent in historical studies and in the humanities and social sciences in general.

Never before in the history of any academic discipline or profession has a society sought to vouchsafe to women the level of equality promised them today. Up until the modern feminist movement, women have been allowed into professions and academic departments in competition with men, and, in effect, they have worked like men.

Today, however, many young women are entering academic departments as self-conscious women, asking research questions that relate to them as women and seeking to reshape their particular discipline to include women's interests and needs.

One consequence of the rising self-consciousness among women is that the scholarly and professional work they produce is related to their values as women. Yet that work inevitably appears to many men—and to the traditions of the fields in which the women work—as not only novel but even faddish and perhaps irrelevant.

That is where the real problem for the future of affirmative action in practice is located. How can men have their consciousness raised so that they are able to recognize the sex-specific origins and definitions of their fields and thus not dismiss out of hand as irrelevant the concerns that inform as well as motivate the new research by women about women?

If the new history of women tells us anything, it is that our generally accepted conception of the past has been derived from the interests of men. Men wrote history to meet their needs and concerns as men. They did not exclude or ignore women because they were misogynists or malicious; they did so because what women did, felt, or thought was not important to them when they looked to the past for guidance, understanding, and identity.

Now that women in increasing numbers are writing history, they are including women because as human beings women need history, too. They need history that includes them just as they need literature, philosophy, economics, and sociology that include them, and of a kind not necessarily like that written by men for men.

In sum, the real test of the success of affirmative action for women will come not by counting the number or proportion of women in a department or profession, but by the extent to which men—who still dominate all the academic disciplines and professions—are willing to accept the new and peculiar interests of women as legitimate and serious, even when those interests are strikingly novel and perhaps even bizarre when compared with current acceptable work in a given field.

Undoubtedly it will take many years for scholarly disciplines to be redefined to include women's interests as integral elements; after all, it took many centuries for those fields to be developed to suit the needs of purposes of men, and they are still in the process of evolution. But simply because the disciplines have been defined by men, they have given us a one-sided or one-sex conception of man. A fuller, two-sex conception has to be developed because the old version is no longer adequate.

Women today are, as they never have been in any previous society, public as well as private human beings. Their interests and their past have to be included in our definition of man or humankind. And they will remain public figures in the future. That watershed in human history has been crossed; there will be no retracing our steps. The only question remaining is, How quickly can we begin to include women and their interests in every aspect of our definition of what it means to be a human being?

Trustees approve new system of faculty titles

The Stanford Board of Trustees has approved a new system of faculty titles, effective Oct. 1.

Developed by the Ad Hoc Committee on the Adjunct Professoriate and approved by the Faculty Senate, the changes include using terms "tenure line" and "nontenure line" faculty instead of adjunct professors.

Changes in titling of nontenure appointments, using parentheses, are as follows:

* Adjunct professors will become professor of chemistry (teaching) or professor of teaching (research) or other subject fields, as appropriate.

* Clinical professors will be described as professor of pediatrics (clinical) or other subjects, as appropriate.

In addition, a new rank—associate professor in the nontenture line—will extend to the entire University. Previously, it was available only in the Medical School.

Present limits on the total nontenure line positions remain the same. They may not exceed 10 percent of the Academic Council, except in the Medical School, where the limit is 20 percent. Only half of these positions are now filled.

Principal investigators status on research grants will remain restricted to members of the Academic Council, except that it may be extended to academic staff members when the sole purpose of a grant is for a workshop or conference appropriate to the University.

Signs is both a women's journal and a way of life—Gelpi

BY MILLICENT DILLON

You could say the subject matter of our journal has become the way of our working life," says Barbara Gelpi, editor of *Signs*, the Journal of Women and Culture in Society, based at Stanford.

"Those of us who work on the publication—and that includes a number of women who are volunteers as well as paid staff—work as a team in which we each respect the capabilities and efforts of the others, she says.

Gelpi, who is also a professor of English, has been editor of *Signs* since 1980, when it moved to Stanford, where it is housed at the Center for Research on Women.

Published and funded by the University of Chicago Press, the magazine is the most important scholarly and academic publication in women's studies nationally. It also has a large influence and readership internationally.

Of the working situation, Gelpi says, "I had heard, before I took over as editor, that women have more trouble than men delegating work or asking other women for advice. I was told that this was true in the business world. But it certainly hasn't been my experience here.

"Of course, I am the one who is responsible in some final way, but in the actual working situation that responsibility is shared. There is a separation of tasks, according to talent and to other things determined by the professional lives of the people involved.

"What goes into the magazine is decided on by the six associate editors and myself with advice from the managing editor, Clare Novak, and the editorial associate, Susan Johnson."

The associates are Stanford history Prof. Estelle Freedman; Myra Strober, director of CROW and professor of education; Carol Jacklin, research associate in psychology; Margery Wolf, an ethnographer specializing in China; and Jane Collier and Sylvia Yanagisako, both professors in anthropology. This year Barrie Thorne, visiting professor of sociology, is a guest associate editor.

Signs has a number of internships that are channeled through the university's undergraduate research and SCIRE programs. The students, working from 10 to 15 hours a week, are treated as part of the working team.

One of the interns, senior Mary Alexander, has set up and developed a book review assistant job for the journal. Other interns have worked on international correspondence *(Signs* has 16 correspondents from foreign countries on its masthead) and on feminist periodicals. Still others have done research in connection with special issues of the journal.

In addition, *Signs* has had summer interns from Arizona State history department, which has a historical editing and publishing emphasis. This year's intern was Rose Byrne, a student from that program. Last year's intern, Susan Johnson, went on to become the editorial associate.

All of the members of the team, though committed feminists, have their own ideological orientation.

"When *Signs* first came here," says Gelpi, "we were very conscious of our ideological range. I think of myself as a liberal. Shelly (the late Shelly Rosaldo, professor of anthropology) was Marxist radical. And there's a whole range of feminist opinion among us.

"However, it's worked out as a non-problem. None of us wanted to make *Signs* the exponent a of particular point of view.

"We really don't argue about matters of ideology. Sometimes because so many people are involved our procedures haven't been good enough. The lines of communication haven't worked.

"In that case we don't take it as a matter of bad feeling, but just that the system didn't work.

"Of course, there are also some differences which we have, when we get together, because time is so limited and we have to cover so many subjects.

Staff of *Signs*, left to right: Myra Strober, Clare Novak, Barbara Gelpi, Susan Johnson

"But then we have evaluations at the end of each meeting and it seems to help us get over rough spots."

Gelpi does not usually chair the meetings of the work group. "That's not one of my skills. I tend to get involved in anecdotes. There are other people who are much better at it than I am, so I'm happy to let them do it.

"Estelle Freedman is a terrific chair. She's very clearly organized and has a strong sense of direction. She's problem oriented and is willing and able to pull people up when they get off the subject. She's courageous in asking people to get back to the point."

Gelpi does not consider *Signs* to be an "advocacy" journal. "We describe ourselves as a journal of feminist research. On the other hand, it's true that we don't publish material about women that isn't feminist.

"When *Signs* first began, in 1975, it didn't make political sense to use the word 'feminist.' There was the old problem in academe: If you're feminist then you're ideological, which means you're not scholarly.

"It is still a problem. There are many academics who say that if you're feminist you can't be objective. But feminists always answer: 'But if you're 'new critic,' you have so much slant to your perspective. You're a white middle-class, middle-aged man and yet you take it that you're objective.'

"I think it's much more honest to say, 'Yes, I'm a feminist. I'm interested in the betterment of women and I'm studying women in this and this situation.' It would only be unscholarly if you fudged your findings, if you were to say, 'I'm going to find out that women are better.'

"It seems to me it's much more true to academic honesty to define to yourself what your slant is, what your interest is and take that into account. The idea of objectivity is often self-deluding in any case. It just means you're taking yourself as the norm."

On the question of what she considers the most important areas for the future in feminist research, Gelpi notes six significant areas for study: The relationship of women to historical change; the role of woman as mother—in fact, in myth, as metaphor; the nature, significance, and permanence of sexual difference, of femaleness and maleness; the relationship of women and science; the social geography of women's worlds; and the development and mechanism of women's movements.

"These are all outlined by Catharine Stimpson, the former editor, and I agree that they are crucial."

At the most recent conference of the National Women's Studies Association, Gelpi noticed several changes in attitude. In the first place, she saw a shift toward much better communication between straight women and lesbians within the movement.

"The lesbian issue wasn't a separate panel. It was much better integrated within all panels. So the lesbian voice was heard with greater openness, as part of a dialogue and with less defensiveness on both sides.

In addition, Gelpi notes, up until now, white middle class feminists have been tending to take themselves as the norm in the women's movement. "Women of color are objecting strongly and vocally. And the white middle class women are beginning to recognize that they have done to women of color what men did to them.

"It's important to listen and to have the intellectual honesty to hear what the problem is. It seems simple once you've heard it."

Gelpi and her co-workers are planning a number of special issues for *Signs*, including "Gender and the Law" (scheduled for 1985, to be preceded by a conference in 1984), "Women and Poverty," "Women and Aging," and "The Lesbian Issue," (to be published in 1984).

A conference on communities for women will be held at Stanford next February. First, there will be a small *Signs* conference, at which papers will be given on special issues. The following day a conference will be held, oriented to the community as a whole, with a keynote speech by Nan Keohane, now president of Wellesley, formerly professor of political science at Stanford.

Dolores Hayden, author of *The Grand Domestic Revolution*, and a professor of architecture and city planning at UCLA, will discuss "Women's Utopian Visions."

"Hayden herself is a socialist," Gelpi says. "She has very strong feelings against the suburban street with its reduplication of resources. She writes about ideas, about women who have had plans for other ways of living and working. Some of those plans, as she shows in her book, have actually been carried out."

Communities of women—that's a subject all of us here at *Signs* are particularly interested in. After all, we ourselves are a community of working women."

Engineers' salaries up 8%, but market more competitive

Salary offers to Stanford engineering students rose more than eight percent this year, but the national market is becoming more competitive for students, according to Richard Reis, director of career planning and placement for engineering and science.

The average of all engineering offers was $2,164 per month for bachelor's degree recipients, up 8.6 percent from last year. Master's degree recipients averaged $2,440, up 9.7 percent, and doctorates $3,119, up 8.9 percent.

But 20 percent of the graduating students made no report of salary offers, compared to only three or four percent in previous years, an indication that quite a few may still be looking for jobs, Reis says. He's also counseled more students this summer than in any previous year, although the situation now is "starting to get better."

This year both the Placement Center and students had to become "proactive rather than reactive," he adds. "Before, students simply went through the motions and offers came. Now they seek jobs out and sometimes make compromises. But the market's still good for them, certainly in comparison to fields outside engineering.

"I see this as a temporary dip, with engineering and science still a good bet for employment down the road.

"It can be healthy, too. The market's been out of kilter for so long that employers were tripping all over themselves making offers. Job turnover was exceptionally high. A more balanced relationship encourages students to think more carefully about what they want to do and how they view their jobs."

Nationally, the number of job offers to bachelor's degree graduates in engineering dropped to 51,290 this year from 62,835 last year. "This would have been considered a boom year as recently as 1978," Reis notes. "In some fields and specialties, such as integrated circuit design and computer programming, demand continues to exceed supply.

"Even in the more recession hit areas of civil, chemical, and environmental engineering, the demand is far better than for non-engineering fields of human biology, economics, and history."

The University of California at Berkeley Placement Center recently reported that "while offers to electrical and mechanical engineers are down only slightly, campus recruitment of civil and chemical engineers has markedly declined.

"The most dramatic turnaround has been experienced by chemical engineers, a group in very strong demand in the past. This year, fewer offers have been reported, and chemical, electronics and aerospace recruiting of these engineers are all down. Petroleum companies, too, are hiring less."

Reis notes that "job hopping among experienced engineers, which was rampant at 36 percent in 1979, was down to a more manageable 23 percent last year.

"While demand has dropped, supply continues to increase at the bachelors and masters degree level. Final 1981 enrollment figures are not in yet, but it is likely they will exceed, or at least match, the record freshman enrollment of 110,149 nationally and the record masters enrollment of 18,500."

For some time, he adds, the allure of industry has reduced the total number of students seeking Ph.D.'s in engineering. As many as 50 percent of the U.S. engineering Ph.D. students now are foreign nationals; some of whom will return to their home countries. Current sluggishness in the bachelors and masters degree market could result in more Americans deciding to pursue Ph.D.'s in engineering, Reis suggests.

Despite the recession, there were more than 416 company recruiting visits to Stanford, involving 5,200 recruiting interviews, compared to 420 company visits and 4,500 interviews a year ago.

Increased student interest and concern was reflected in a rise from 75 to 100 counseling appointments with Reis per month, starting earlier than usual and continuing well into July and August. The number of students participating in the Engineering Resume Book rose from 250 to 525.

Besides helping students find jobs, Reis says the Center helps them develop long-term career planning and decision-making skills through workshops, seminars, and counseling. Students may typically face five to seven occupational changes and three to five career changes. Certain specialized occupations now have a "half-life" of only three to five years, he notes.

"While the immediate short term picture is not as bright as in recent years, the prospects two to five years ahead look good. The next decade looks especially encouraging, especially for bright students graduating from top schools."

Following is a comparison of 1982 starting monthly salary offers at Stanford with those at 158 colleges, including Stanford, as reported by the College Placement Council:

A Comparison of 1982 Stanford University Starting Monthly Salary Offers with Average Nation-Wide Starting Monthly Salary Offers at 158 Colleges as Reported by the College Placement Council

	B.S. Degree		M.S. Degree		Ph.D. Degree	
	Stanford	nation-wide	Stanford	nation-wide	Stanford	nation-wide
Aero & Astro	—	1.973	2.328	—	3.141	—

– No degree, insufficient data

New program helps Ph.D.s find professional careers

The widely touted "taxi-driver syndrome" no longer strikes terror in the hearts of growing bands of Stanford graduate students.

Faced with increasingly bleak prospects for careers in college teaching, they're starting early to assess their skills and find nonacademic jobs through the professional opportunities program (POP) of the Career Planning and Placement Center.

They call themselves "poppies," and they're starting to blossom. The prospective Ph.D.'s don't regard themselves as poor seconds to MBA's; through informal networks with fellow Ph.D.'s they're becoming executive trainees, marketing analysts, and development directors.

The self-confidence gained through systematic assessment of their abilities and interests have helped several gain good starting jobs in academe as well.

In recent years, about half of Stanford's doctoral graduates in humanities and social sciences have obtained college teaching jobs. Another one in four started work in industry, nonprofit organizations, or government. The remainder continued as postdoctoral fellows, returned to their home countries, or continued to seek employment.

"Stanford Ph.D.'s are still doing well in the university teaching market, but that doesn't mean we can ignore the problem of dwindling job opportunities," says Edward Escobedo, the Placement Center's director for college and university teaching, who helped create the professional opportunities program last year. He credits Ruth Schneider and Alice Branstrom with making the program "successful beyond our expectations."

Again this fall starting Oct. 19 they'll offer graduate students a series of workshops on 1) academic job searches, 2) preparation of curriculum vitae and cover letters, and 3) job interviewing and personal presentation. "POP" series is scheduled for winter and spring quarters.

Those who come back discouraged from the academic conference "meat-markets" in the late fall and early winter may opt for POP during winter and spring quarter.

Edward Escobedo

"Career planning doesn't have to be left to chance or last minute desperation," Escobedo emphasizes.

"We're dealing with people who are incredibly talented.

"We're really amazed at the help other Ph.D.'s who've started professional careers outside academe are willing to give. In fact, they've become our teachers.

"There are many opportunities for people who know how to organize, conduct research, and communicate well.

"Networking and support systems are important. Many of those in last year's workshops have decided to continue meeting on their own as they complete their degrees. They may publish a newsletter. They're kind of forming a family of their own."

Academic departments have been supportive of the new program. Escobedo urges participants to talk with the academic advisers, to consider summer internships and other jobs offering a "window" on possible careers, and to think carefully about any elective courses they may take.

As one of the POP participants put it: "To be a Renaissance person, you have to know the language. These days, it's computers."

Under "languages," some "poppies" list "Greek, Latin, Spanish, and Fortran."

To reject computers out of hand, Escobedo suggests, may risk following in the footsteps of those who heard of the printing press soon after Guttenberg but reject it as "too mechanical." Familiarity with statistics is another skill which may prove helpful in nonacademic employment, as well as in the classroom.

Besides having Ph.D.'s lead panel discussions on how their degrees help in their current careers, Escobedo has employers provide insight on appropriate ways to prepare for industrial opportunities.

"We don't want to force students to abandon any aspirations for an academic career. Instead, we emphasize the process of career planning and exploration, leaving the decision of when and where this can be applied up to individual participants."

Nonstop, continuous writing can help some overcome blocks

Stanford gets the cream of the crop. They are all bright and motivated. But...that doesn't mean they can write adequately.

—Nancy Packer

Nonstop, continuous writing can help some bright students overcome their fear of writing, says Prof. Nancy Packer, head of Stanford's freshman English program.

These students are eager to do well, yet they have so internalized criticism that paralysis sets in, and their writing becomes stifled and abstract.

To deal with this problem, teachers may encourage students to "free write"—to write continuously, never lifting the hand from the paper, putting down whatever thoughts occur, and when no thoughts come, to fill in with repetition or nonsense.

"This method helps to break down that instant self-censorship which grips many very good students when they start to write," Packer says.

At the other extreme is the student who writes down anything that comes into his or her head, without any conception of making an argument or organizing evidence. The point of their writing is only self-expression.

For this kind of student, Packer points out that the Stanford Freshman English program now has a strong component of logic or critical thinking.

"We think we can show them something about how to develop a persuasive argument, about assumptions, inferences and conclusions, and about what constitutes evidence."

In between are students with a whole range of problems in writing. Fortunately, "we now have small enough classes so that each student can get special attention from the instructors, whatever the problem," she notes.

"Stanford gets the cream of the student crop. They are all bright and motivated. But of course that doesn't mean they can write adequately."

Writing skills decline

It is generally conceded that writing skills have declined. "One bit of evidence is the national decline of SAT scores," Packer notes. "But just picking up a national magazine points to the same conclusion. "Both *The New Yorker* and *Time* have always prided themselves on their good writing, but it's clear from reading them that the writing in both has declined considerably."

This ought not to surprise anyone, she adds. "In the first place, young people who might have spent time reading are now watching television, going to the movies, and listening to tapes. In addition, in many high schools there are fewer hours of instruction than there used to be. In some areas the reduction is as much as 12 percent. At the same time more demand is made for those fewer hours."

New courses are offered, including the almost obligatory driver's education, as well as social sciences that had no part in the high school curriculum 40 years ago. Even the sciences, Packer points out, are more demanding than they were.

"With all this competition for student time, what gives? English, language study, and history. There is little wonder that we are seeing a continuous decline in the ability of students to read and write."

Often when people talk about bad writing, they mean that students can't spell or punctuate or use good grammar, she notes. "Those are the easiest problems to correct. There is not a student at Stanford who could not learn these mechanics. The problems we see are much more serious."

Packer pays warm tribute to the staff of writing instructors. "They are very devoted, competent, and hard-working. And they love working at Stanford. We're lucky to have such a good staff."

Although the focus of all the 60-plus courses is writing, students choose sections according to what special topics will be explored. "It is a tenet of our faith that students can learn to write better more quickly and easily if they are not also fighting the subject matter. We encourage them to choose courses in which they will read and write about what they care about," she says.

"Writing is at the heart of the whole academic enterprise. It is given short shrift in many universities but that is not true at Stanford. The Academic Senate has always required that freshmen take composition and the administration has been very supportive."

Packer spoke at a recent conference of volunteers and fund-raisers for Stanford.

—Donald Stokes

Faculty should be alert to promising new directions in scholarship, research

continued from page 1

search committees, validate the procedures followed, maintain rosters of potential minority and women candidates for future vacancies, and provide advice to deans and department heads, the report said.

The University should "inquire carefully" about the attitudes and records on affirmative action of candidates for administrative positions. "It should be unthinkable to appoint as administrator anyone who does not wholeheartedly support" affirmative action, the report said.

To strengthen recruitment of women and minority scholars, the Faculty Affirmative Action Fund should support campus talks by highly qualified candidates, encourage trips to national scholarly meetings to identify potential women and minority faculty members, and help Stanford faculty members briefly extend their stay at other institutions when there is an opportunity to become familiar with the academic work of promising students close to completing their Ph.D. theses.

Faculty members should remain alert to "promising new directions in which scholarship and research may be moving." The accurate, early assessment of such trends can be a decisive factor in the long-term standing of departments, as seen in the response to the development of Darwinism in several disciplines and the introduction of solid-state electronics in electrical engineering and computer science.

"It is vital that Stanford make such assessments as well in emerging fields in the humanities and the social sciences in which gender and racial-ethnic differences have become key categories of analysis. *(See Degler story, page 4).*

"The study of race and gender in history, for example, has moved from the periphery of attention to an important role in understanding the development of society. Such inquiries have attracted many of the most eminent of established historians and the most talented of our graduate students. Similar perspectives of gender and race have altered other fields in the humanities and the social sciences."

To help retain and strengthen younger faculty members, the committee recommended reinstituting the junior faculty leave program, permitting those facing special demands to develop their scholarly careers. The relatively small number of women and minority faculty members, compared to the large number of women and minority students, creates pressure to "advise and assist on a scale that goes far beyond normal departmental advising."

Mentors needed

Junior faculty also need mentoring and monitoring by "sympathetic but demanding" senior faculty to keep track of individual progress, provide informed advice, and help in obtaining research grants.

"All too often, graduate students do not learn of these activities prior to taking an academic position. It is to the faculty member's and the institution's advantage that they be taught," the committee said.

Department heads should provide "meaningful and carefully considered annual conferences" with individual junior faculty members, the committee added. "Too often, we have heard, the conferences do not take place or are superficial. These conferences are extremely important feedback to all junior faculty. . . ."

During 1981-82, there were 13 new appointments of women to the faculty, including one full professor. There were 10 minority appointments to the faculty, including one associate professor.

The percentage of minority group members in tenure line positions has increased slowly but the proportion among all those with tenure has doubled in the past decade, the report shows.

Affirmative action fund

The Faculty Affirmative Action Fund should be continued to help hire "outstanding people who would add significantly to our academic programs but who do not fill an existing billet (or vacancy). . . .

"The small numbers of black and chicano graduate students in all fields, and the small number of women graduate students in many fields, imply that progress in increasing the numbers of these minority and women faculty will be slow, indeed, if our hiring of them is determined alone by the matching of existing positions with the best people."

The text of the committee's report will be published in *Campus Report*, the University's weekly newspaper for faculty and staff members, Wednesday, Oct. 6.

Bienenstock formerly served as the University's faculty affirmative action officer. Other committee members and their schools included Profs. Barbara Babcock, law; William R. Evitt, earth sciences; Dora B. Goldstein, medicine; Arturo Islas and Diane Middlebrook, both humanities and sciences; James G. March, education, who resigned; Susan S. Owicki, engineering; and Jerry I. Porras, business. Student members were John Trasvina, law, and Kendyll Stansbury, education. Assistant Provost Cecilia P. Burciaga served ex-officio.

Graduate POP...

continued from page 6

Most students starting POP completed the program. "In general, they were highly qualified, success-oriented individuals representing a broad range of past experience. One woman had been a secretary and a roofer and was about to complete a doctoral program in social science faster than usual. Only a few had decided to leave academia entirely."

Initial fear and apprehension gave way to more self-confidence and cooperation as the program progressed, he added.

"Many expressed a renewed determination to complete their programs of study."

All participants agreed that the initial program met or exceeded their expectations. For most, the greatest gain was in self-confidence.

As one "poppy" put it: "Since completing my Stanford Ph.D. in 1979, I have experimented with part-time teaching in the area. Finding that temporarily satisfying but too tenuous a path to pursue, I was sinking into a stupor of despair and self-pity until I enrolled in the POP seminar. . . . The program provided me with an arena for fresh self-evaluation, the moral support of others in my position, and clear, practical advice." Further information concerning the program may be obtained from Escobedo at the Career Planning and Placement Center, Stanford, Calif. 94305. Phone (415) 497-2009.

The first of the new undergraduate residences to be completed, on Governor's Avenue behind the great eucalyptus trees, house 60 students each.

Governor's Corner: housing rises where horses once roamed

Where Leland Stanford's horses once did their trotting, nearly a century ago, a new little city has been built: housing for 800 undergraduates.

Appropriately, the new complex is called Governor's Corner.

The first of the 800 moved in at the beginning of autumn quarter, 60 students in each of three independent houses, similar to the newest of the Row houses.

In January, another 260 will move into four buildings with suites, and in September, 1983, Sterling Quad, the final portion, will be ready—four houses, each for 90 students.

The net increase for undergraduates will be 350 spaces, because Manzanita Park will be changed into a residence for single graduate students.

The new residences will make it possible for the first time (since the University's opening years) "to house all undergraduates who are willing to live in any University housing," says Norman Robinson, associate dean of students for residential education.

For a quarter of a century, the University's "long-range policy, as the ideal, is ultimately to house all undergraduate students on campus," except those permitted to and wanting to live off-campus. But while it has not been easy to achieve that end, steady steps have been taken over the years to provide more housing *(See story, page 9.)*

"Stanford is in the housing business because it is in the education business," said the authors of *Student Housing Needs at Stanford* in 1979—Robinson; Sally Cole, student affairs; and Edward A. Scoles, housing management. "Stanford's commitment to the educational importance of students' living in campus residences is long-standing and unequivocal."

They realized that off-campus housing prices were beginning to escalate; that 1,000 undergraduates were being denied campus residences; and that single graduate students, as well, needed on-campus housing.

A Committee on New Residences, composed of students, staff and faculty, was organized and met weekly for more than two years, discussing ideas, physical facilities, uses-every possible aspect of the proposed new housing.

"We decided we didn't want to build just one huge building," says Robinson, "but to capitalize on two of Stanford's characteristics—diversity and residences as complement to undergraduate education."

("A residence which is no more than a collection of students in a collection of rooms," says one advance study, "does not belong, and should not exist, on the Stanford campus.")

Representatives of the architectural firm, Esherick, Homsey, Dodge and Davis; the construction manager, Rudolph & Sletten; and the interior designer, Marquis Associates, worked closely with the committee. The final result is a variety of housing, linked by multiple-use facilities, landscaping, and concepts.

Total cost of the new housing, including designing, building, and furnishing, is $36,200,000, the University's largest single construction project.

The first segment to be completed is composed of three independent houses similar to the Robert Moore houses built on the Row in 1975. Each holds 60 students and a resident fellow and family.

Each of the new houses is named after a distinguished faculty and staff member:

Treat House, for Payson Jackson Treat, who earned Stanford's first Ph.D. in history in 1910. He taught Far Eastern history from 1905 until his retirement in 1945, and estimated his classes had included 7,000 students. He died in 1972.

Murray House, for Augustus Taber Murray, classicist, Quaker, and athlete who taught at Stanford from 1892 to 1932. He died in 1940.

Yost House, for Mary Yost, who began 25 years of Stanford service in 1921, when she was appointed Dean of Women and associate professor of English. She died in 1954.

Room designs allow for almost unlimited flexibility. Many rooms have storage lofts, over the hallway and taking advantage of the peaked roof. The oak furniture (wardrobe, bed, desk, dresser and bookcase) is specially designed to provide options—the bed, for example, can be on the floor or elevated to provide more floor space.

Every room is wired for data and video terminals, and has a smoke detector plus a red light outside over the door to tell firemen if there is a fire inside that room. The residences had to be built to the same state codes as hotels and motels.

The big living rooms have fireplaces, built with reclaimed sandstone blocks from the University's early construction days. The buildings are stucco painted natural earth colors, with quarry tile floors in many public areas. Outdoor sitting and meeting areas are numerous, with barbecues and volleyball.

Resident Fellows of the three new houses are Albert and Susan Camarillo; John and Betty Kaplan; and Harumi and Kei Befu (whose residence has been designated as the East Asian Studies Theme House).

The next phase, four buildings for 260 students living in suites, plus four eating clubs, is scheduled to open in January, 1983.

continued on next page

New residences...

continued from page 8

Each suite houses four to six students (plus two housing eight) whose living space includes a small living room and shared bathroom, plus individual bedrooms—an apartment minus the kitchen. Access is via outside corridors and the buildings have many sun decks. Two small kitchens are available, for the always-hungry students to prepare snacks at any hour.

Residents will affiliate with one of the four eating clubs.

Each of the eating clubs has open beam ceilings, carpets, and a lounge with fireplace, and each has space to accommodate a limited number of non-residents. The clubs, according to Project Manager Elizabeth Kittas, are designed to be used by their members also for parties, lectures, dances and other group activities.

In September, 1983, Sterling Quad is scheduled to be completed—four houses, each for 90 students, and a resident fellow and family. The houses share a central dining hall/performance center building.

"There will be lounges and seminar rooms in every building, plus two formal classrooms," says Robinson. "In Sterling Quad, for example, the buildings are designed in shapes that allow room for special interest groups, such as 10 or so students with a project, that won't disrupt the overall life of the house."

The big dining room will acommodate the 360 Sterling Quad residents, but in addition will be a theater. Dorm drama is ubiquitous at Stanford, and now a new stage will be provided for all kinds of performances.

Also opening this fall is a new program center, right on the west edge of Lake Lagunita. It has many of the spaces that normally would be in every house.

The second floor, with a huge deck overlooking the lake, has two multipurpose rooms. The larger one has a hardwood floor for dance and musical performances, and lectures, and the other is carpeted for receptions, meals and meetings. A large kitchen is available for catering or demonstration cooking (students love to learn how to cook), and an entire house could have a meal there—the big rooms will hold 100 at a sit-down dinner.

The center also houses mailboxes for all residents, music practice rooms, a darkroom, a theater set construction room, a computer terminal room, and other general use space, as well as administration offices. A central communications room has facilities to broadcast video and audio material into every residence. It also has a small student-run snack bar.

Room designs in the new houses near Lake Lagunita provide great flexibility for students, who moved in last Sunday. Here sophomore Laurie Magnusson begins to get settled.

All the buildings have plumbing and roof brackets for solar panels to heat hot water when it becomes economically viable at Stanford. In addition, a substantial energy saving has been made through use of fluorescent and metal halide sodium vapor lighting rather than incandescent lights.

Jan van Houten, director of the new residences, notes that next door to the center will be guest rooms, one a small apartment designed for a visiting professor-in-residence, and that the program center—as well as the residences—offers facilities for round-table discussions of almost any size.

Governor's Avenue, the historic lane which led from the Stanford residence to the horse barns, trotting oval, and lake, has been retained as "a public spine" which provides the means of extending the housing area if and when needed in the future.

"Governor's Avenue is an important part of Stanford's history," says Elizabeth Kittas, "and with its magnificent trees it provides a beautiful entry way and route for pedestrians and cyclists."

A tree expert was and will be on hand to protect the trees during the long construction period; some eucalpytus trees had to be taken down for age and safety reasons, but many new trees have been planted. In the middle of the new residences, a meadow dotted with native oak trees has been left in its natural state.

The new landscaping is drought resistant, with limited irrigation area. The one big new grass area occupies the center of the site.

When planning for the new residences began, committee members visited and investigated university residences across the country. One fact they brought back was statistical. In 1978, comparing on-campus housing for upperclass students, Princeton housed 97 percent; Dartmouth, 93 percent; Harvard, 88 percent; Brown 79 percent; M.I.T. 77 percent; and Stanford, 74 percent. (The 1981 Stanford figure had grown to 77.3 percent.)

When Stanford's 800 units are complete, Stanford will be able to house 82.6 percent of all undergraduates, and, in the summer, will have new facilities for conferences.

—Harry Press

New residences reflect goals adopted by trustees in 1979

The goals of Stanford's student residence programs were outlined in a 1979 report, "New Undergraduate Residences at Stanford," prepared for the Board of Trustees:

* **An intellectual** and friendly atmosphere conducive to high academic interest and achievement.

* **Stimulation** of interest in cultural activities such as theater, art, and literature through direct participation in University activities of this nature; attendance at campus and Bay Area events; discussions; the development of house libraries, including several newspapers and periodicals; the introduction of art into residences; the encouragement of good music; and a wide variety of information to assist students in making better decisions about graduate school, scholarships, and career opportunities.

* **Opportunity** for members of the faculty to have closer, informal association with students in the dining rooms, lounges, and student rooms, where student experiences will be deepened and widened, and their ideas quickened, challenged, and tested.

* **A means** whereby faculty of the University can meet individual students, and learn enough about them to make intelligent recommendations for employment, scholarships, and advanced study.

* **A place** where tutoring is available, academic advising is given both as to specific courses and career opportunities, and individual student problems are identified and referred for professional services.

* **An opportunity** for each student to choose, within the limitations of practical necessities, the group with which he will associate.

* **An opportunity** for intercultural exchange by living with students from other geographical areas of this country and overseas.

* **An environment** conducive to good citizenship and consideration of others and their property, with opportunity to learn responsibility through house government, and opportunities for leadership.

* **A varied** social program in which members of the house may entertain guests and have opportunities to meet people from outside their own group. Activities should be conducted so as to foster good manners and social competence, and to provide opportunities for recreational outlets including intramurals for every member of the house.

Commitment to residential education reflected throughout post-war period

Stanford began life as a residential university, and has tried to be just that ever since. It's not always been easy.

But in 1957, the Board of Trustees voted that "the long-range policy of the University, as the ideal, is ultimately to house all undergraduate students. . .on campus," except those permitted to live off-campus and wanting to do so.

Since then, those responsible for student housing constantly have been moving toward that ideal:

* In 1969, 460 "temporary, emergency" spaces were provided in a cluster of trailers known as Manzanita Park. They're still in use, and will be for many years.

* In 1974, a major study of undergraduate housing was completed and, as a result of its recommendations, 250 spaces were added: three new Row houses for 50 students each, and 100 more by closing in the ground floor of Florence Moore Hall.

* The "guaranteed housing plan," started in 1975, gives every undergraduate three of four guaranteed years of on-campus housing.

* In 1979, the study begun in 1974 was expanded and updated, and its conclusions said 800 new spaces were needed. The first of those spaces were occupied by undergraduates Sept. 26.

David Kennedy gives frosh new view of A-bomb's role in U.S. policy

The atomic bombs dropped on Hiroshima and Nagasaki were "not the last shot of World War II, but the first shot of the Cold War," Stanford history Prof. David M. Kennedy told 400 freshmen during orientation Friday, Sept. 24.

A member of the Stanford arms control faculty and author of *Over Here*, an analysis of World War I which was runner up for the Pulitzer Prize last year, Kennedy described the Cold War as "a two-handed game. . .with responsibility allocated to both players," the U.S., and the Soviet Union.

"The U.S. has not been a passive, innocent actor in this historic drama," he declared.

As early as 1942, President Franklin D. Roosevelt ordered work on the atomic bomb slowed until the U.S. received assurances from Winston Churchill that the British would not pass on information about its development to the Soviets. At that time, Britain and the Soviet Union had a formal treaty favoring such exchange of information.

David Kennedy

The U.S.-British alliance deepened as the war continued, and their attitude toward the Soviets hardened, Kennedy said. When physicist Niels Bohr urged sharing of atomic information with the Soviets in 1944, FDR had him tailed to be sure this did not happen.

From the outset, there was "a very deliberate, determined policy to freeze the Soviets out" of this knowledge, while the U.S. and Britain moved to control the raw materials and technology of atomic weapons.

After the fall of Germany in 1945, the U.S. delayed the Potsdam conference for two and a half months, sensing that successful development of the bomb would strengthen its diplomatic hand at the table. President Harry S. Truman once said: "if it explodes, as I think it will, I'll certainly have a hammer on those boys."

Contrary to their popular image, American leaders were "realistic, tough-minded, and hardly naive" about Soviet intentions, Kennedy said.

At Potsdam, Truman informed Stalin about the bomb "almost as an afterthought," others observed. Instead of sharing information to obtain compliance with U.S. goals, Truman had begun to see the political utility of actually using the bomb. It would be "a much harder twist" diplomatically, Kennedy said.

By the summer of 1945, there is "indirect, but powerfully suggestive" evidence the U.S. wanted to end the war against Japan before the Soviet Union entered the conflict and enlarged its power in the region.

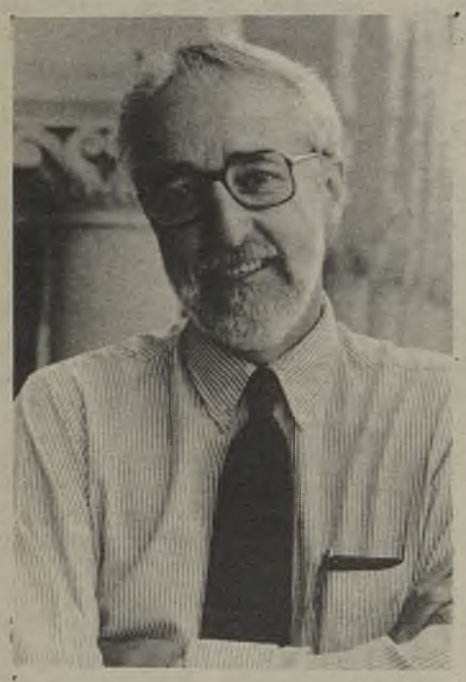
At the Yalta conference, the Soviets had agreed to join the war against Japan three months after Germany fell. The intervening time was needed to move troops from Europe to Asia. Germany surrendered May 8, 1945; the Hiroshima bomb was dropped Aug. 6, 1945, just two days before the three-month period would have elapsed.

Kennedy said it was "essentially true, but not fully accurate" to say the bomb was dropped to save American lives which would have been lost if an invasion of Japan had proven necessary.

Because it had broken the Japanese diplomatic codes, the U.S. knew Japan was trying to arrange a negotiated surrender through Moscow, asking only that the institution of the emperor be retained.

Every alternative to dropping the atomic bomb either took time, which would allow the Soviets to mobilize for war in Asia, or directly involved the USSR, which would then be in a position to extract diplomatic concessions, Kennedy noted. The alternatives included a prolonged naval blockade and bombardment of Japan, a demonstration of the bomb's power at an uninhabited island site, or simply the "shock effect" of a Soviet declaration of war against the Japanese.

Confidence in their nuclear capability made American leaders reluctant to comply with the Yalta agreements, especially concessions to the Soviets in China and the Far East and reparations from Germany.



"The U.S. was suspicious of Russia and behaved hostilely toward Russia well before the Yalta conference and well before the Cold War is usually assumed to have begun," Kennedy said.

"The American attitude toward the Soviet Union hardened in the summer of 1945, before the major Russian provocations of the Berlin crisis and their behavior in Eastern Europe really made an impression.

"The American mind against the Soviet Union hardened not because of these provocations but because of the confidence that the possession of atomic weaponry gave American leadership. . . .

"The U.S. had very definite, hard-nosed, well-considered policy goals. As early as 1942, it perceived the Soviet Union as an obstacle to the accomplishment of these goals. The development and eventual use of the atomic bomb demonstrated that the U.S. was willing to play very aggressive geopolitics.

"This does **not** add up to the conclusion that the U.S. caused the Cold War, or that the Cold War was avoidable if only the U.S. had behaved more nicely toward the Soviet Union." Responsibility rested with both sides.

Norman Wessells

Self-examination rough at times, but central to education—Wessells

While it may be "rough at times, self-examination is central to self-education," Humanities and Sciences Dean Norman K. Wessells told 1,300 Stanford parents Thursday, Sept. 23.

"The social and economic diversity of our students, and the educational processes that go on here, result in innumerable subtle and direct challenges to personal, family, political, ethical and moral values," he added. But these challenges ultimately will yield young adults on whom their parents, their university, and their country can depend.

"Though you may feel loneliness upon returning home and walking into an empty bedroom, or have mixed feelings at being able to use your own car on Saturday night without asking permission, you should not despair," Wessells said.

Going to college "is not a permanent break or a rejection of parents or home. Through your genes—genetic, that is, not blue—your family life, your role in the pains and joys of adolescent...years, you have passed on to your daughter or son values and standards that will serve as guidelines for these years at Stanford. Do not worry that they will be easily eroded or lost.

"We on the faculty can never be all that you have been to your children. But we can do some things very well, one appropriate for what we are as teachers and scholars....This will be a glorious time in their lives, but only they can live those lives."

Student Affairs Dean James Lyons noted that "Stanford is a place where students take responsibility, individually and collectively, for their own affairs." He cited the presence of more than 400 red-shirted upperclass students who returned early to help with orientation as a prime example.

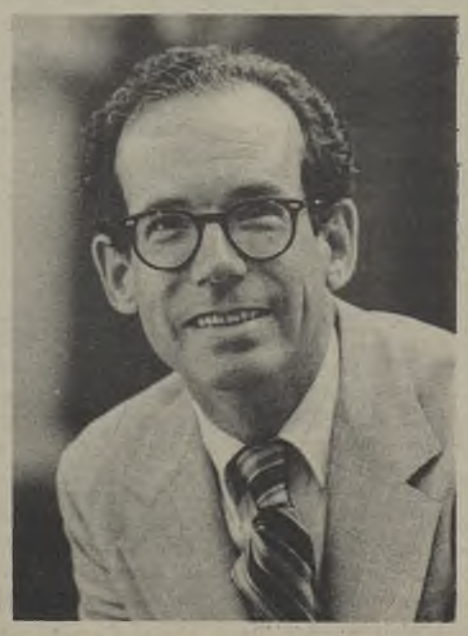
President's advice: work hard, stay healthy, have fun



"Work hard, stay healthy, and have some fun," Stanford President Donald Kennedy advised 1,600 freshmen Thursday, Sept. 24.

Urging students to sense the unity of their education with the rest of their life, he said:

"If I have anything to criticize about Stanford's style, it is that even some of the most conscientious and devoted students here fail to extend intellectual exploration to the life they lead outside the classroom and the library.

"The best parts of what you do here may entail the sharing with others of new insights and understandings. That should go on in the residences as much as it goes on in the seminar room."

As he did with seniors at commencement last June, Kennedy urged freshmen to develop "the confidence that comes from knowing that one's education actually works—that things one has been taught actually can succeed when applied to new problems, in unfamiliar circumstances. . . .

Donald Kennedy

"Think of learning not in terms of remembering and writing things down, but in terms of working new problems and breaking new ground.

"If you have just spent an hour underlining things with one of those dreadful yellow marking pens, something is wrong! Application, synthesis, writing new things about new knowledge—those are the kinds of activities that yield. . .confidence."

Noting that the class includes the largest proportion of blacks and chicanos in Stanford history, Kennedy said: "At Stanford, we believe that confronting difference is valuable even—perhaps especially—when it is painful.

"This is why we lay such great stress upon admissions and financial aid policies that yield us a student body that represents the full richness of our culture; and that is why we propose to continue those policies even though others may be abandoning them.

Stanford, other universities seek lower PUC rate hikes

Representatives from various universities and colleges in California, including Stanford, the University of California system and the State University and College system, have met several times this summer to try to form an association of large, nonprofit energy consumers.

The primary motive for organizing the group is the financial impact that Public Utilities Commission (PUC) rate decisions have had on California institutions of higher education.

The impact that rate changes can have is illustrated by their effect on Stanford's energy bill last year. Four decisions on PG&E rate applications increased Stanford's energy costs by $2 million. Other California schools have experienced similar increases.

Other energy consumers have organized groups that participate in PUC cases for the benefit of members—for example, the California Manufacturers Association and the consumer organization Toward Utility Rate Normalization. But the universities and colleges have not had such an organization.

"It is inefficient for staff at Stanford, UC, and the State university system to separately spend time tracking PUC activities when our interests are similar," explained Energy Program Assistant Manager Nancy Teater, who has represented Stanford at this summer's meetings.

Nonprofits hit hard

"The PUC has tried to protect residential customers from having to bear the brunt of utility rate hikes, so it has passed a larger share of the increases on to industrial and commercial sized customers," she continued. "But the schools are uniquely affected because we are nonprofit service institutions and cannot readily pass our price increases on to consumers."

The impact of price increases is not the only motivation for forming the energy association. It is equally important for universities to remain informed about the amounts and timing of utility rate changes. Rates can be altered several times during the fiscal year, and if the changes are not expected, an institution can experience serious fiscal problems. For example, Stanford's 1981-82 Operating Budget could not have readily absorbed an unanticipated $2 million increase in energy costs.

One of the important purposes of the association would be to monitor energy price changes so that the member institutions could update their budget forecasts immediately after PUC decisions are made. The association would also intervene as a group in PUC cases that adversely affect large nonprofit institutions.

Stanford staff members have been following PG&E rate cases closely for two years. They knew that the University of California's state-wide office was involved in similar activities and that other universities and colleges were interested in the efforts of the two schools. So they decided to attempt to establish a more formal organization. The purpose of this summer's meetings has been to work out the administrative details of such an association.

According to the most recent proposal, the association would be led by a steering committee chosen from among the institutions involved: the UC systems, the State University and College system, the state community college system, and the independent colleges and universities.

Consultant sought

This committee would hire a consultant who would follow the utility rate cases and PUC decisions and provide an information service for the members. The group would also hire a law firm to represent the association in PUC hearings, when the committee decides that rate case intervention would be beneficial. The membership fee for the association would be based in part on a percentage of the school's annual energy bill and in part on the number of utilities that the school wishes to monitor. Under the present scheme, Stanford would contribute about $13,000 to the effort.

While the existence of an association would not be a guarantee of immediate financial payback for the member institutions, such a return is a possibility. As a result of testifying in a natural gas rate case in December, 1980, the University of California was able to convince the PUC to conform to the wording used in certain Federal regulations. As a result, the UC-Berkeley campus qualified for annual savings of about $300,000, as well as a lump-sum credit of $200,000.

The Stanford representatives are not emphasizing the possibility of such immediate financial rewards, however. "We may end up intervening in a case which will save us all a significant amount of money," said Teater, "but since we cannot guarantee such results, we will continue to emphasize the administrative benefits of the association. We can certainly save time for those who have been performing overlapping duties in the past, and we are sure to be able to cut down on budget uncertainties associated with energy price instability."

From Stanford to Harvard, electronic mail now links more than 1,000 users

The President of Stanford uses it. So does the University of Chicago. If you are a Stanford faculty or staff member, you may be using it too.

More than 1,000 people at institutions from Stanford to Harvard participate in CONTACT/EMS, the electronic mail system administered by Stanford's Center for Information Technology (CIT). In these people's offices, the computer terminal has become as essential as the telephone.

Access to CIT's IBM 3081 computers offers several advantages over both the telephone and ID mail. Electronic mail can be sent whenever it's convenient for the sender; it's transmitted instantly; and it can be processed in turn whenever it's convenient for the receiver. Paper copies can be made if desired.

Research confirms the benefits of electronic mail: users tend to send and receive fewer paper and phone messages, and they believe the quality and quantity of their work has improved.

Electronic messaging at Stanford has been growing for several years now. The ancestor of CONTACT/EMS is WYLBUR MAIL, with which users of CIT's IBM computer system can "talk" to each other while logged-on to the computer or send messages to others' electronic mailboxes.

In 1979 the WYLBUR delivery vehicle was combined with the storage and retrieval facilities of SPIRES, a database management system. This led to the development of the Terminals for Managers (TFM) electronic mail system, which in turn evolved into CONTACT/EMS. The user community has expanded to include nation-wide educational groups such as the Association of American Universities.

While logged-on to their WYLBUR account, users of CONTACT/EMS can compose messages and send them to other users' electronic mailboxes. CONTACT/EMS includes an extensive directory, allowing messages to be sent using a person's individual name or a distribution list name, as well as a computer account.

When messages are received, they can be forwarded or replied to, filed under a given subject, discarded, or filed to be brought up again on a specified date.

The EMS staff is continuing to develop the system, producing enhancements such as the recently installed automatic answering feature, which manages your electronic mail while you are away from your office for an extended period.

CIT is offering a one-session introductory course this quarter on the use of CONTACT/IMS for those who are interested in learning more about electronic messaging. The class will be given from 10 to 11:50 a.m. Thursday, Oct. 7, in Turing Auditorium (Polya Hall, Room 111) by Suzanne Mills of Departmental Information Systems. Registration is at the Information Desk in Forsythe Hall.

Copy centers run 3 million a month

The main copy center operated by Word Graphics is open from 8 a.m. to 5 p.m., Monday through Friday. It is located in the Graduate School of Business, Room B-02.

Word Graphics Copy Centers produce three million copies per month using top-of-the-line Xerox and Kodak duplicators. They now have a 27 percent enlargement feature with their new Canon copier.

First priority is to complete all jobs submitted by campus departments. If workload permits they will accept personal and nondepartmental jobs.

For order forms and information on services call 497-3132.

New publication-quality laser printer offered users of 3081 computer by CIT

A new publication-quality laser printer, the Xerox 9700, is being offered to users of the 3081 computing node.

Edgar Williams, director of Computer Systems and Services at the Center for Information Technology (CIT), announced that introduction of the 9700 marks the first step in the development of a "printer/publications node" on SUNet, the campus computing network.

The Xerox 9700 is more than a printing subsystem, in that it has the ultimate capability to do significantly more than the present laser printer.

Like the IBM printer now in use, the Xerox 9700 uses a laser to produce character images on a page. It prints 8½ by 11-inch pages at a rate up to two per second, and at a resolution of 300 dots per inch (twice the resolution of the present printer).

This means that copy from the Xerox 9700 looks like letter-quality typewritten material, a great boon to those who would like to make more use of computer-aided publishing tools.

The Xerox printer also allows character sets to be more clearly defined than was possible in the past; it will eventually allow a greater variety of print styles, including proportionally spaced characters. The Xerox prints on plain white bond, 3-hole punched, and blue paper.

The 9700 printer can print on both sides of a page (duplex printing), and can print on the entire page, including top and bottom margins. Two page formats are available: "portrait," in which the lines are printed parallel to the short sides of the page, and "landscape," with the lines printed parallel to the long sides of the page.

Also a double-page format allows printing of two pages on one side of a page, using a smaller typeface. The double-page format allows compact, high-density printing of archival or reference data. Each page side contains two complete page images, cutting in half both the size and the cost of the output. The size of the output can be reduced further by using the duplex option to print on both sides of the paper.

Initial service for the Xerox 9700 is limited, but significant enhancements and a transition to a wide variety of publication-quality output are planned.

A document called "Using the Xerox 9700 Printer" will soon be available from CIT's Document Sales office in Forsythe Hall.

Museum, Gallery closed by strike

The Stanford Museum and Art Gallery will remain closed for the duration of the strike of service, maintenance and technical employees at the university.

When the labor dispute has been resolved and the museum opens, the following exhibits will be on view: **Museum**, *Paul Harris: Still Life* thru January 2, 1983, and *Printmaking Techniques* thru December 19, 1982; **Art Gallery**, *Venice in the 18th Century* thru December 19, 1982.

University contends final wage offer fair, competitive

The following statement is a collaborative effort by several administrators and represents the viewpoint of the University administration.

The University says that it has bargained in good faith and placed a fair offer on the table. The union says that the University can afford to pay much more, that the offer is less than other staff at Stanford are receiving and that the University is refusing to negotiate. Such differences in perception result from misunderstandings about two things: the nature of the economic forces now acting on universities, and the character of the collective bargaining process.

Stanford is often thought of as a "rich" university. It does indeed have a larger endowment than many schools—but as a charitable trust, it must exercise fiscal responsibility to keep that endowment intact and maintain a balanced budget. In that budget, the significant income sources are tuition, funds given by the government for the general support of research and earnings on its endowment. Of those the University can only control tuition. Thus the major annual increases in expenses, such as salaries and energy, must come primarily from sources such as tuition increases or reduction in the expenses for items such as academic programs and student aid. Obviously, though, there are limits as to the amount of tuition increase and program and financial aid cuts. Last year the University made substantial expense reductions, partly so that faculty and staff salaries would move up with inflation. This past spring improvements in salaries for faculty and clerical workers were announced to make their pay competitive with that offered by outside employees.

The union has claimed it should receive a wage increase that exactly matches or betters these. In fact exact comparability is neither fair nor reasonable. University faculty and staff do different jobs, are comparable with different "markets" and have different compensation structures and histories. The total offer made to the union would provide wages and benefits very competitive with those provided to similar employees by comparable employers, including the University Hospital; it is substantially above the current inflation rate; and it is about twice about the national average for negotiated new contract agreements in this year.

The University's offer was developed through negotiations at the bargaining table. In collective bargaining there are two quite different approaches—a party may start with proposals far from any reasonable goal at which it ultimately wishes to arrive, or it may start fairly close to that ultimate point. The first approach subsequently allows large and seemingly dramatic moves by the party but places the party in the initial position of making proposals that are not particularly credible. ("We have reduced our demands by one-half—we now want only a 50 percent increase.") The second approach provides credibility because the proposals are close to an ultimate reasonable goal, but restricts the party's ability to move significantly further.

USW proposals called "excessive"...

continued from page 1

Baratz announced Tuesday that union members would start a vigil at 7 p.m. on the lawn of Lou Henry Hoover House, the University-owned residence of President Donald Kennedy. "We're going to stay there until we settle the strike," he said, adding that the vigil will be "nice and peaceful." Participants, including people from other unions, will bring candles, he said.

The Stanford Daily reported Tuesday that at a union membership meeting Monday afternoon a move failed which would have required the negotiating team to get membership approval before accepting any new University proposals.

Of the tabled motion Baratz said Tuesday "it's clear we've made an incredibly reasonable proposal and this shows the membership is concerned that we don't go down any lower."

Strike support remains high, with approximately 800 workers still off their jobs. Picket activity, which was suspended during the weekend, continues, but many delivery trucks are crossing the lines. Pickets were removed from major construction project sites last week and construction is again underway.

In the last week, vandalism dropped dramatically, but Stanford police are still working 12-hour shifts.

Over the weekend, the campus came alive with more than 12,000 students who begin fall quarter Wednesday.

Food service affected

The strike's greatest inconvenience was to the University Food Service, which is trying to feed the 3,300 students who live in dorms it serves. Food Service Director Maxine Anderson Tuesday had nothing but praise for students, staff, faculty, and administrators who are working together to get the job done. Many faculty residents are hosting students for dinner in their homes. Fraternities and eating clubs also are helping out by serving other students.

Food Service supervisors and mangers worked long hours preparing food for freshman attending orientation Thursday through Sunday. On Monday, Anderson's staff began serving breakfast and lunch on cash basis at Wilbur Hall.

Students were given rebates covering what they paid for meals during registration Monday and Tuesday. The rebates will be handed out every Monday at the Old Union Cashier's Office from 9 a.m. to noon and 1 to 4 p.m. for the duration of the strike.

Approximately 1,000 meals were served Monday, Anderson said. Adequate staff has now been assembled so that Florence Moore Hall will open for breakfast and lunch Wednesday.

Among Anderson's helpers are Jason Mavis, associate vice-president for business and finance, who worked the grill cooking hamburgers during freshman orientation, and Norm Robinson, associate dean of student affairs, who served on the line. Paul Hanna, emeritus professor of education, and Ed Scoles, director of housing management, worked cash boxes at Wilbur Hall Monday.

The University's final offer, presented Sept. 7, is for a 9.5 percent increase the first year, with increases of 7.5 to 10 percent in the second and third years of a three-year contract.

The union says its proposals would cost the University 11.5 percent the first year and 12.6 the second.

—Karen Bartholomew

Students must initiate request for help, Lyons notes

continued from page 10

While it makes both deans and parents jittery at times, Lyons noted that students are repeatedly told: "If you need help, ask for it. There's lots of help here and it is responsive. But the responsibility for seeking help rests with you."

While the University pays attention to students, they are not monitored as closely as parents or high schools might do.

"We do have safety nets here," Lyons said, "But they are not constantly in view.

"As parents, you may learn from time to time that things are not going perfectly—that your son or daughter is experiencing some difficulty or another. It is perfectly reasonable in such situations to ask them what *they* have done about their quandry, whatever it is."

Stanford's own studies of undergraduates have shown that most students continue to turn to their parents for advice and support, Lyons added. "It seems to be a time when they begin to view their parents as friends rather than as someone to grow up under; as a sounding board for views and opinions rather than as sources of direction and control; and as sources of pride, encouragement and good comments."

"There is an underlying assumption here that students learn and grow better if they learn about, confront, and come to terms with the social, religious, and ethical differences that abound in our society. (These) will show up repeatedly in the informal curriculum of residential life at Stanford."

Lyons observed that "few universities so deliberately try and so obviously succeed in having a student body as diverse as at Stanford. Aside from the common traits of high aspirations, brightness, and a history of solid academic achievements, this student body is amazingly diverse.

President Donald Kennedy urged the parents to reinforce in the young "a sense of adventure, a willingness to take intellectual and social risks, and a curiosity about portions of the world that have previously been beyond their reach.

"For that voyage we can provide a good stock of opportunity, and eager hands to help. But we cannot compel, any more than you can, the drive to explore and to know. We can only believe in it, hope for it, and reward it."

Admissions Dean Fred Hargadon said that the nearly 14,000 applicants to Stanford this year were "academically able" and "highly energetic," coming from every state and more than 50 foreign countries.

More than 2,000 had straight-A averages in high schools. Well over half had grade point averages of 3.5 or more on a 4.0 scale. In the past four years, applications to Stanford have risen about 40 percent while the freshman class size has remained unchanged.

To understand student interests, Hargadon suggested, the most important single fact to keep in mind is the year in which they were born—basically 1963-65 for this year's freshmen.

This year, for the first time, Stanford applicants were asked what person in history they would most like to meet. One replied: "The Beatles." Another, more calculating, said: "The mother of the dean of admissions."

Don Kennedy...

continued from page 10

"Confronting other cultures, other values, other beliefs, can only succeed if you are willing to do things that occasionally make you uncomfortable.

"I urge you in the strongest possible way to take those risks, to avoid the temptation to seek the comfort of the familiar in your years here."

Kennedy said: "You are in every way the most remarkable freshman class ever to enter Stanford," quickly adding: "I enjoy being able to say that each fall; it indicates we are moving in the right direction."

Applicant test scores averaged 10 points higher that last year's, he noted. "You come from all over the world, as well as from all parts of the U.S." Geographically, the class balance has shifted significantly, with more students coming from the East and fewer from California.

As he did with last year's seniors, Kennedy urged the freshmen to develop a tolerance for ambiguity: "This is not a world in which many things are certain. We often need to exist for a time in the presence of awkward, unresolved difficulties. . .but there is comfort in sharing a challenge. . . . Others are in the same boat; talk to them about it. . . .

"The great issues with which we grapple are seldom confrontations between good and evil; rather they are collisions between competing goods.

"Also, I wish for you a strong, but not incapacitating, skepticism about certified truth.

"Remember one of the great Stanford lessons: the textbook may be wrong, even if the professor teaching the course did write it.

"That is not a criticism of your professor, who is doubtless wonderful. But the impermanence of the written word, the instability of conventional wisdom, is an important part of the intellectual dynamic in which I hope you will choose to live. . . .

"Confidence in your own capacity to analyze, interpret, project, experiment, and reason includes the suspicion that *they may have it wrong*.

Besides maintaining a sense of humor, he suggested, "be committed to things in an unembarrassed and enthusiastic way. Being 'cool' is really not so great. . . .

"Be willing to speak up for an important idea, to urge others to get involved in something important, even when you appear to encounter reluctance and passivity. There are all sorts of things in this world that are much worse than being condemned for overenthusiasm."

Letters to the editor

University should improve final offer, end strike quickly— six faculty

Editor, *Campus Report*:

Many of our colleagues have told us they do not understand the issues at stake in the current labor dispute between the University administration and the United Stanford Workers, Local 715, and the implications of the strike and the stalled negotiations. Perhaps their uncertainties result from the adversarial character of most material published by both sides and the difficulty of reading between and under the printed lines.

While not pretending to complete understanding of the intricacies of the dispute, we think we have some insights worth sharing with the community. Our first purpose is therefore informative.

But we have a second purpose: to urge the University administration to resume the negotiations which it stopped with its "final offer" to the union of September 7.

The United Stanford Workers, numbering about 1,300, are a heterogeneous group, with membership ranging from carpenters, electricians, plumbers, and skilled technicians at SLAC and elsewhere, to gardeners, food-service workers in the dormitory kitchens, and custodial and janitorial workers. Their contract with administration expired on August 31. After negotiations lasting more than two months, the administration made its "final offer" on September 7 and the union went out on strike on September 10.

There are three stated issues: the union's demand for information about temporary workers, job-shoppers and workers that are contracted for with non-union agencies; wages; and medical and dental benefits.

The first issue is the union's legal justification for the strike because it failed, apparently, to give the required thirty days notice of a strike for economic causes to the NLRB. For two years the union has been demanding this information, presumably because they believe that these workers do the kind of work that ought to be done by union members and they want the opportunity to organize them. The NLRB has ruled in the union's favor on this issue, but the university has appealed that ruling in the courts, on the grounds that it needs these non-union workers for "flexibility."

One of the union's early demands in this area might have had an impact on working hours available to students because the union sought a redefinition of part-time work from 19.9 hours per week to 14.5 hours per week. But the union has dropped that demand, so nothing related to the first issue threatens the part-time jobs of students.

The second issue, wages, is the most difficult to describe because of its intrinsic complexity and the intricacies of the language in which demands and offers are stated. The administration's "final offer" includes four components: a three-year contract; a 9.5 percent across-the-board increase in the first year; a 5 percent across-the-board increase in the second and third years; and new "fourth steps" of 2.5 percent in the second year and 2.5 percent in the third year. The "step system" involves graduated increases in pay related to length of service in the job; the expired contract had three "steps."

On September 17 the union made a major reduction in its wage demands. The latter now have three components: a two-year contract; in the first year an increase of 10.25 percent or $140 per week, whichever is higher (the union estimates this increase, designed to give particular help to its lower paid members, as averaging out at 10.75 percent); in the second year an across-the-board increase of 5 percent plus the introduction of a new fourth step of 5 percent; and "realignments" or upward reclassifications of the jobs of about 50 percent of the workers, involving increases of up to 15 percent for some workers. The union and administration agree that the realignments would increase the wage base about 3 percent.

The third issue is medical and dental benefits. The administration has offered **no** improvements in this area. The union is making three demands: that the administration pay for any increases in the cost of medical insurance; that in the second year the administration pay for full coverage for dependents in the cheapest plan (probably Kaiser); and that in the second year the deductible for dental insurance be reduced from $150 for a family of three or more to $50 for a family of any size.

We have a few observations to make about these issues. We agree with the NLRB that a union should have the opportunity to identify workers who, in an open shop, might wish to join the union if they understood the options. It is sadly indicative of the lack of such an opportunity that, when two janitors cleaning the rooms of Inner Quad were asked about the strike, they responded: "What strike?" Not surprisingly, the janitorial work in Inner Quad (and elsewhere?) is contracted out to ACME.

Wage differences appear small

On wages, the two sides seem so close, apart from the difference over length of contract, that they should be able to settle the matter quickly if the administration would budge from its "final offer." Priscilla Wheeler, the administration's negotiator, stated, in her September 21 memorandum to the University community, that the union's demand is "of such magnitude" as to be "simply not reasonable." Surely this is an instance of managerial hyperbole.

Medical and dental benefits cry out for improvement, not only for members of the union, but for members of the faculty and staff as well, especially with respect to coverage for dependents.

It is ironic that Priscilla Wheeler boasts of the contract's including a provision "requiring the University to offer to USW any benefit improvements made for other University employees." If the union had not won a dental plan for its members, it is highly unlikely that faculty and staff would have even the inadequate one they have now.

This review of the issues raises in our minds a crucial question: why has the administration refused to move from its "final offer" of September 7 when the union has shown genuine flexibility in its demands?

Is it possible that the real issue in this dispute from the administration's perspective is not money but **unions**?

Does the administration have its eye on the vote, to be taken soon, by the technical and service workers at the Hospital, to organize, to join USW or not to join? Is the administration refusing to move from its "final offer" in order to starve the union into acceptance and thereby make it appear an impotent agent in the eyes of the Hospital workers?

Now we wish to turn to the implications of the strike's continuation, due so far as we can tell to the administration's refusal to bargain, for us as members of the faculty, for our students, and for the university community.

For many teachers, especially in the Humanities, Social Sciences, and programs like VTS and Western Culture, the nature of justice is a central issue in our courses, and most of us, we believe, hope that our students come to admire and strive for a just society. But a university community in which members of the faculty are receiving raises of up to 11 percent and secretaries about as much, but in which technical and service workers are offered raises of 9.5 percent, strikes us as setting before our students an example of an unjust society, especially when some of those workers, like cooks and janitors, are trying to support families in the Bay Area on about $6 per hour. Similar percentage-raises mask the injustices created by the different wages on which those raises are calculated. And even Plato, that great admirer of hierarchy, might have balked at Ms. Wheeler's argument that the setting of wages must be "dominated by consideration of the 'markets' " for employees outside the University.

Moreover, we believe that most of us try to help our students understand the origins of racism stereotypes in our culture in the hope, so often expressed by Donald Kennedy in his addresses to students, that they will come to respect and cherish people different from themselves.

Strike may foster racial hostilities

But we fear that the continuation of this strike will breed hostility in many of our students toward workers for not providing them the services that they have come to expect; and because the workers most directly denying them these services are the Blacks and Chicanos who ordinarily work in the kitchens and clean the toilets, their hostility to the workers might quickly translate into hostility to racial minorities.

This problem, we fear, will be especially acute in the dormitories—Wilbur, Stern, Branner, Florence Moore, Roble, and Lagunita—and it will impose a virtually intolerable burden on Resident Fellows and Resident Assistants who will be making strenuous efforts, both during and after the strike, to discourage tendencies to racism.

Finally, we suspect that few members of the faculty realize that, as of Monday, September 27, no evening meals will be served in the dormitories. Apart from the logistical problems of helping students, especially freshmen who do not know the area, find those meals, resident fellows and resident assistants will lose one of the most important contexts they have for residential education—the leisure of dinner. And the students will inevitably be distracted from study by the scramble to find evening meals.

Our conclusion is simple: the strike must be ended quickly, and the administration must move from its "final offer" of September 7 and bargain in good faith to end it.

USW plans vigil at President's House

continued from page 20

In this case, the union has used the first bargaining approach, and the University the second. Thus, the union was able to make many moves away from its proposals because the proposals were excessive to begin with while the University has been able to make only small moves, because it chose to make proposals that were reasonable and credible to begin with. The University's negotiating team advised the union at the time of its proposals that the University was not holding back significant amounts, but was making proposals very close to the University's ultimate goal.

Where have these efforts led? The University made a final offer because the union had stopped making significant moves. A final offer, as the union is aware, does not mean that the union must accept that proposal precisely as it was structured by the University. The purpose of the offer was to alert the union to the fact that the University's ability to make further major compromise was exhausted and to provide the union with a clear and candid indication of the University's viewpoint. Obviously the University was signaling that it would accept anything reasonably close to its offer. Equally obvious, the University would not accept proposals that are as excessive as those the union has been making during the strike.

At this point the union continues to strike and to claim its decision was forced by the University. Yet, the choice to strike was USW's. Strikes are not necessary to the resolution of contract disputes. The University would have continued neogitating in good faith and would have worked hard to reach agreement with or without a strike; and it will settle only on terms that it believes it can responsibly approve, with or without a strike.

Six professors plan lectures at Palo Alto's Senior Center

Six Stanford professors will discuss "Our American Political and Cultural Heritage" in a series of public lectures at 2 p.m. on alternate Mondays, starting Oct. 4, at the Senior Center of Palo Alto, 450 Bryant St.

Prof. Carl Degler of the History Department will give the opening lecture on "Understanding American History Today" and will speak again Nov. 15 on "Plantation Culture in the South."

Other speakers and their topics will include Prof. Seymour Martin Lipset, senior fellow at the Hoover Institution, "Creating a New Nation: The Revolutionaries and The Statesmen," Oct. 18; Prof. Jack Rakove, history, "The Revolutionary Legacy and Northern Society," at 2:30 p.m. Nov. 1; Prof. Don Fehrenbacher, history, "Fort Sumter and Appomattox," Nov. 29; and Prof. Jay Fliegelman, chairman of American studies, "The American Enlightenment and Its Legacy," Dec. 13.

Prof. William Goss, historian and emeritus president of Canada College, will discuss "The World Today" at 1:30 p.m. on alternate Mondays, starting Oct. 11.

The lectures are free to senior center members, 25 cents each to non-members.

Derwood Becker, emeritus professor from New York University, is coordinator of the series. It is part of the group services program conducted by Beverly Fuchs.

Further information may be obtained by calling the Center at 327-2811.

Academic Council

To Members of the Academic Council
Notice of Special
Academic Council Convocation
Friday, October 8, 1982

A special meeting of the Academic Council will be held on Friday, October 8, 1982, beginning at 4:15 p.m. in Dinkelspiel Auditorium. The agenda for the meeting will be as follows:

1. Remarks by the Provost and announcement of national awards to members of the faculty.
2. Remarks by the Deans of the Schools and announcement of teaching awards to members of the faculty.
3. Minutes of the Council meeting held on April 9, 1982 (Draft minutes below).
4. Memorial Resolution: Friedrich W. Strothmann.
5. Report from the Chairman of the Senate.
6. Report from the President.
7. Unfinished business.
8. New business.
9. Adjournment.

The President and Provost will host an informal wine and cheese reception following the meeting.

Clara N. Bush
Academic Secretary

DRAFT MINUTES OF THE ACADEMIC COUNCIL

(SUBJECT TO APPROVAL)
April 9, 1982

The Spring Quarter meeting of the Academic Council was held on Friday, April 9, 1982, beginning at 4:15 p.m., in the Physics Lecture Hall (ph100), with President Donald Kennedy presiding.

The Minutes of the Academic Council meeting held on January 8, 1982, and published in draft form in *Campus Report* of March 31, 1982, were approved as submitted.

The following memorial resolutions were presented to the Council.

MEMORIAL RESOLUTION
VERNON DALE WICKIZER
(1904 — 1982)

Professor Eric Hutchinson presented a resolution in memory of the late Vernon D. Wickizer, Professor Emeritus in the Food Research Institute, who died on February 8, 1982. The resolution, which was prepared by Emeritus Professor William O. Jones (Chairman), Professor Walter P. Falcon, and Professor Roger W. Grey, was adopted by the Council in the customary mannner.

MEMORIAL RESOLUTION
ANATOLE GREGORY MAZOUR
(1900 — 1982)

Professor George H. Knoles presented a resolution in memory of the late Anatole G. Mazour, Emeritus Professor of History, who died on January 26, 1982. The resolution, which was prepared by Emeritus Professors Wayne S. Vucinich (Chairman), Thomas A. Bailey, and George H. Knoles, was adopted by the Council in the customary manner.

REPORT FROM THE CHAIRMAN OF THE SENATE

Professor David B. Abernethy, Chairman of the Fourteenth Senate, presented a report on the activities of the Senate during Winter Quarter 1981-82. The full text of Chairman Abernethy's report is given below.

REPORT FROM THE PRESIDENT

President Kennedy thanked members of the Council for agreeing to meet one week later than is usual. The delay of one week was caused by the scheduling of a memorial service for Mrs. Kennedy's mother, who recently died.

President Kennedy said that he wished to devote much of his report to a discussion of undergraduate education at Stanford. He did so in part because the undergraduate program lies at the heart of the University, and in part because in his inaugural address a year ago he had identified undergraduate education as an important priority for future planning.

During the past academic year we have seen the complete installation of the Western Culture Program and the new Distribution Requirement program. There have been the usual growth pains, but the programs have fared better than is expected of academic experiments. Likewise the new program in Public Policy is off to a good start.

A remaining, and troublesome, item is the lack of multi-quarter programs that, while directing attention at particular themes or fields, would satisfy two (or even three) areas of the Distribution Requirements. Especially troublesome is the lack of new courses for non-majors in the sciences and technology. President Kennedy said that we plainly cannot afford a society in which to be "educated" does not demand basic scientific and technological literacy.

Professor James L. Adams will shortly be taking over the direction of the program in Values, Technology, and Society, and President Kennedy appealed to all members of the Council to assist Professor Adams in that work.

We have a continuing need for ways in which undergraduate students can acquire experience in independent study. During the 1960s and early 1970s, a number of departments had active undergraduate research programs. Much of that activity has survived, and we now have some centrally organized programs in undergraduate research, but we ought to make a much more intensive effort in this field in order to have our undergraduates take advantage of being in a research university.

This past year, when we are undertaking a large undergraduate residence construction, has provided an opportunity for concentrating on residential education.

Provost Hastorf has appointed an *ad hoc* committee to look at many aspects of undergraduate education, including the organizational arrangements for the management of and advocacy for undergraduate education. One possible outcome of that committee's work may be a closer and more effective working relationship between pragramming and planning for undergraduate education and the Schools and departments most directly involved in getting it done. Our present system has only minimal central controls over the curriculum. That circumstance has been valuable and has led to innovations and flexibility, but it has also produced some schedule problems, some complaints about overlap, and a thick catalog that many believe needs some pruning.

Whether we intend it or not, we can easily transmit the wrong signals about our values regarding undergraduate education. The neglect of quad classrooms and some of our major lecture halls may well have been such a wrong signal - one that we cannot afford to tolerate. Over the past two years we have spent nearly $300,000 restoring some of those facilities to first-rate condition, and others will be restored in the coming years.

Our plans for residential education provide for greater faculty involvement. Seven of the eleven houses in the new complex have been designed with faculty residences, and a number of distinguished faculty members have agreed to take up residence there.

President Kennedy said that in his talk to the seniors at Commencement he had gone to some lengths to exonerate them from charges of being too "careerist and preprofessional." During the current year, he said, he had experienced some twinges of doubt. There are grounds for concern that many of our students appear to focus on the aftermath of their Stanford experience at the expense of the here and now. That problem may be worst for just those students who know most clearly what they want to do. We should not flag in our determination to encourage our students to think much about matters unrelated to their career ambitions.

A major problem in any undergraduate education program is to know how effective our efforts are, what we have added to the students' values through our own efforts. We have developed a serious program of assessment through the institutional researches initiated by Dean Katchadourian. We are now acquiring more information than we ever had before about what undergraduates do at Stanford and how they feel about their experiences here. In particular, the Senior Survey tells us something about student reactions to major programs, instructors, etc.

These studies will remind us how important students are to *one another* in the educational process. That point is worth emphasizing, because, paradoxically, it is the quality of our student body that is most threatened by current economic and political forces. We shall continue to admit students without reference to their financial needs, but it will be harder than ever before to find the means to do so. Yet nothing can be more important than for us to continue to admit students on the basis of merit alone. Our need-blind admissions policy is central to everything that we do, and if a principle is good, as we believe this to be, it is worth keeping absolutely intact.

President Kennedy ended his report by reading a letter that he had recently written to the father of a member of the class of 1985, who had congratulated the University on the fine experience that his scholarship-holding daughter was having while, at the same time, apologizing for the family's present inability to make a financial gift to Stanford.

The full text of President Kennedy's report may be read in *Campus Report* of April 14, 1982.

There being no *Unfinished Business* and no *New Business* having been raised, the Council adjourned at approximately 5:00 p.m., on a motion moved and seconded.

REPORT OF SENATE CHAIRMAN, ACADEMIC COUNCIL MEETING, APRIL 19, 1982

Winter quarter is usually the least busy time for the Senate. In autumn quarter the Senate is occupied in hearing Annual Reports from the seven Council Committees; and in spring quarter policy matters that have been generated in those committees during the previous two quarters begin to come before the Senate for action. This year's agenda has been different.

For a variety of reasons, two Committee Reports, those for the Committee on Graduate Studies, and for Undergraduate Studies, came to the Senate in winter quarter.

The main item in the Annual Report of C-GS dealt with the transferability of credit from another institution to Stanford. For many years it has been the practice for the Graduate Studies Office to rule on the transferability of course credit. The Committee decided that in such basically academic matters it is much more reasonable for Schools (and their departments) to make those rulings. The Senate approved that change.

Another recommendation from C-GS fared less well in the Senate. For many years the Graduate Studies Office has held as informal guidelines a number of recommendations, proposed in the 1972 Report of the Study of Graduate Education at Stanford, for terminating graduate students on academic grounds. It is rather extraordinary that, in the 10 years since those recommendations were made, the Senate has not been asked to affirm them as *policy*.

The termination of graduate students for academic reasons is not a common occurrence, but when it does occur it occasions some difficulty and some pain for all parties. It is reasonable for both students and faculty to expect that we should have a clear policy to deal with a step as serious as termination, and in February C-GS brought to the Senate for approval what were, for all practical purposes, the 1972 recommendations for dealing with this issue. The Senate, after fairly lengthy discussion, decided that the language of the recommendations needed to be written more clearly, particularly as regards the way in which evidence unfavorable to a student should be presented and evaluated. The Senate also questioned whether rules that might work well in large departments are equally appropriate in small departments.

The outcome was that C-GS was asked to reconsider its recommendations and to submit them to the Senate at a later date. This is an important matter and we should establish a clear policy as soon as we can.

Most of the items in the Annual Report of the Committee on Undergraduate Studies had already received Senate approval, so that no new policy actions needed to be taken. But one rather troublesome matter came up—not for the first time. C-Us has statutory oversight responsibility for about 15 academic programs, some of which nominate candidates for degrees, which are not "lodged in academic departments." These programs are subject to review by the Senate every five years, and approval for continued authorization is by no means a routine matter. The accidents of history have resulted in the accumulation of a large number of such reviews during spring quarter of this year, which means that the Senate will be busy. The large number of programs that has accumulated prompted the Senate to consider a more general question to which these programs are related.

Interdepartmental programs not infrequently entail setting up new courses, and that, in turn, uses up some University resources. In most cases the funds to support these programs come from a budgeted item called Consolidation and Improvement. Some years ago that "C & I" item amounted to three percent of the Operating Budget base, and we could afford to be relatively generous and open-handed in supporting new programs. In recent years, however, rising costs have forced a reduction in the percentage of the Operating Budget that we can devote to "C & I." The figure is now 1.5 percent, and there is some doubt that it can be maintained at that level unless Deans are able from their own resources to make some financial contributions to innovative programs.

Accordingly, the Steering Committee, and later the Senate, concluded that the review and re-authorization of these programs should be more searching. We probably cannot afford to keep establishing new programs unless we

Academic Council...

continued from page 22

are prepared to terminate some that have not come up to earlier expectations or have outlived their usefulness. The Senate therefore has asked that all future reviews of interdepartmental programs include comments by Deans on the financial impact of individual programs and committee views on their comparative educational value. This spring we hope to review programs in related clusters, to make better comparative judgments.

As far back as last summer, the School of Medicine, after an extensive internal study, concluded that its main component of the adjunct professoriate—the Associate Professors and Professors of Clinical Subjects—labors under the disadvantage of titles which discourage recruitment. Dr. Crowley requested that the titles be changed to something along the lines of "Professor of Anesthesia at the Valley Medical Center." Shortly thereafter the School of Engineering raised questions regarding the adjunct professoriate, and from other sources questions concerning who should or should not be allowed to serve as a principal investigator arose. The Senate decided that the questions were sufficiently numerous and of sufficient importance to justify the formation of an *ad hoc* Committee on the Adjunct Professoriate, with fairly broad terms of reference.

Nearly two years ago the Senate established a committee on the status of our emeriti. That committee reported to the Senate on January 21. The report was published in *Campus Report* and I will not repeat it here. Although many of our emeriti seem to be surviving financially, there is a small number who are clearly suffering some financial hardship. It was reassuring to learn that the University has offered to provide some relief in those cases which, were it not for the existence of this valuable committee, might well go unnoticed.

At the same January meeting the Senate also heard a final report from the Provost's Task Force on Retirement Policies. That report also was published in *Campus Report*. The main conclusions in the report were that Stanford should continue to have a mandatory retirement age, under the law, as it now stands, at age 70; that provision should be made (as it has been) to make it financially possible for faculty members to take early retirement between the ages of 62 to 70; that, whenever it is mutually beneficial, departments should recall emeriti to part-time active duty; and that the Personnel Office should provide counseling for faculty members approaching retirement or contemplating early retirement. In all, the Task Force has made 11 recommendations; a number have already been approved and put into effect; others are still under study by the administration.

The Senate also heard a report on the University's Comprehensive Housing Program, the highlights of which have been published in *Campus Report*. The program is based on an extensive survey of faculty and staff on their perceived needs for campus housing. In addition to the Peter Coutts units which are now well along in construction, the long-range program includes the purchase of housing in the Oak Creek Apartments and the building of some 1,200 housing units in the neighborhood of the Children's Hospital and some 190 units on a smaller site on Welch Road. The report provides definitions of various eligibility pools. The comprehensive program for housing, which follows last year's program for land use, is a useful document, but it must be remembered that it is a program, not a settled policy that must be followed in every detail in some predetermined time-sequence.

In February the Senate heard a wide-ranging and fascinating account from Dean Cox of the work now being carried out in the School of Earth Sciences. Dean Cox took us on an interesting tour which started with a theory of fossils in 18th century canal-digging in England, passed through the present-day formation of mineral deposits on the ocean bed, and dealt with great movements in the earth's crust as interpreted in terms of plate tectonics. Dean Cox also pointed out that the Geological Survey, is very directly involved in geological research. That circumstance produces a need for the School to look at sources other than the federal government for a substantial fraction of its research support.

In March the Senate heard a presentation of the Operating Budget Guidelines for the coming academic year. It should be a comfort to members of the Council to understand that with some tightening of the fiscal belt—to the extent of one percent of the budget base—Stanford is looking at 1982-83 with the prospect of a balanced budget for the sixth consecutive year. To balance a budget, in the face of rapidly rising costs—for labor, for materials, and most of all for utilities—is no small achievement in times when the return on stock market investments is notably poor. The feat is the more remarkable in that, in the same year, the University is taking strong steps to reduce the dependence of professorial salaries on research grants and contracts, through the long-practiced but risky procedure of "salary offsets." In 1982-83 our dependence will be greatly reduced.

To balance increased expenses, it is elementary that we have to increase income—notably through increased tuition. However painful the Stanford tuition increases may seem, an analysis of comparable institutions shows that we have been relatively restrained in putting further pressures on our students or their families. It is some time since we experienced a substantial increase in the rate of recovery of indirect costs, and one of the penalties for holding the line in this regard is that when increases are inevitable they tend to be quite large. Such will be the case in 1982-83, where the indirect cost recovery rate will be 69 percent, but, Principal Investigators should bear in mind that Stanford's negotiating team managed to retain the principle that the tuition for graduate research assistants continues, against expectations, to be chargeable against the Staff Benefits Pool. Furthermore, the negotiations resulted in desired modifications to the effort-reporting system.

The prospects for 1983-84 suggest that the password may be "austerity," but austerity is not synonymous with bleakness, and we have much cause to thank a number of individuals dealing with budget matters for their ingenuity in finding sound ways of raising and disbursing the University's general funds.

Many of you have read accounts of the difficulties that have arisen from attempts on the part of some government officials to impose on the University, under the guise of new interpretations of regulations dealing with technology export, limitations on how Stanford scholars shall deal with visiting scholars from particular countries. In the face of those difficulties the University administration, notably in the persons of President Kennedy and Dean Lieberman, has spoken with a single unequivocal voice. This is an open university with a very clear policy that forbids the practice of classified research.

At the last meeting of winter quarter the Senate adopted in an undivided vote a statement that reaffirms Stanford's policy on openness in research. It seemed appropriate at this time to reaffirm our position, to make clearly and publicly a statement that openness in universities such as Stanford makes a contribution to liberty in our society and, rather than reducing the effectiveness of our national security, adds to our technological security.

Senate chairmen report to you, routinely as it seems, that each quarter the Senate confers degrees on suitably qualified and approved candidates. On, happily, rare occasions the Senate also takes away degrees. During the past quarter the Senate had the unwelcome duty of withdrawing an advanced degree that it conferred last June and of concurring in a disciplinary decision to suspend, for the same student, a degree for a period of two years. In withdrawing the degree the Senate was not making any moral judgment on the student involved: it came to light that as a consequence of misrepresented grades the student had not in fact qualified for the advanced degree, so that the grounds on which the degree had originally been conferred were inadequate.

I would also like to pay special tribute on behalf not only of myself but also my eight predecessors in chair of the Senate, to Professor Eric Hutchinson for serving so ably and conscientiously as the University's Academic Secretary. At our last meeting, Provost Hastorf announced that Professor Hutchinson would be stepping down from this post at the end of this academic year, to become more involved in writing the centennial year history of the University. I will hold the Academic Secretary remiss as an historian if he does not include some immodest reference, in his forthcoming book, of his own contributions to this University—as our institutional memory, as the authority on parliamentary procedure, as invaluable assistant to the Chair, Steering Committee, and Committees of the Senate, as calligrapher, as chemistry professor—and perhaps most visible as flag designer. You return to a more private life. Professor Hutchinson, with our thanks and best wishes.

MEMORIAL RESOLUTION
FRIEDRICH W. STROTHMANN
(1904-1982)

Friedrich W. Strothmann was born in Elberfeld, Germany, on October 25, 1904. In 1924, after graduating from the local *Gymnasium*, he enrolled in the University of Cologne. There in 1929 he received his Dr. phil. in Germanic philology under the direction of the distinguished scholar Friedrich von der Leyen, and a year later earned diplomas in both English and philosophy. In the latter subject, which he studied under Professor Nikolai Hartmann at Cologne, he developed an enduring interest in the philosophy of Kant and Herder, which also led to his becoming an expert in the thought of Thomas Aquinas. His doctoral dissertation *Die Gerichtsver handlung als literarisches Motiv in der deutschen Literatur des ausgehenden Mittelalters* (Jena 1930) was reprinted in 1969 by the Wissenschaftliche Buchgesellschaft in Darmstadt. In 1930 he was appointed an instructor in Germanic languages at Stanford, and that September arrived by ship in San Francisco to find awaiting him a first-term teaching load of four courses, ranging from elementary German to Middle High German philology and the plays of Schiller. At the end of that busy year, he returned to Germany and, with the help of a non-quota visa arranged for by President Ray Lyman Wilbur, then on leave as Secretary of the Interior, was able to bring his wife Luise back with him to Stanford. Over the next few years, despite heavy responsibilities within his own department, he helped his colleagues in English to set up an important minor program in philology which, as the executive head of that department enthusiastically reported, attracted its graduate students "to real philological study." In addition, he won acclaim for his excellent work as a member of the planning committee of the then-existing School of Letters, and still found time to pursue his study of Medieval Latin and to deepen the knowledge of the writings of Aquinas for which he was noted among many generations of Stanford students.

An amusing sidelight to these latter interests is that, as America's entry into the Second World War approached in 1941, rumors began to circulate that two Stanford professors of German origin were seen to be out suspiciously late of nights around the Menlo Park area. A letter from Professor William Cooper, head of the department, informed President Wilbur that the suspicious persons in question were Professor Strothmann and his colleague, Kurt Reinhardt, who were spending Thursday evenings reading Latin and the works of Aquinas with faculty members of the nearby St. Patrick's seminary.

Willi Strothmann's limitless energy and enthusiasm for the general educational enterprise of the university during these earlier years did not slacken, but rather presaged his later impressive achievements as one of the most innovative and influential educators in Stanford's history. From 1949 until his retirement in 1970 he served as executive head of his department, which expanded for a decade (1958-1968) into the Department of Modern European Languages. As its leader, he worked tirelessly to elevate the various language divisions, several of which had been treated before as mere service units, into strong representatives of the humanistic disciplines. In 1953, he wrote a report on *The Graduate School Today and Tomorrow* that led to his founding of Stanford's interdisciplinary Graduate Program in Humanities, which he also directed during the first five years of its existence. Mindful too of the need to expand the horizons of the undergraduate curriculum, he conceived the idea of the Overseas Campuses and in 1958 served as the director of the original center at Beutelsbach. From 1960-1969 he also supervised the highly regarded NDEA Summer Institute for Advanced Study at Bad Boll, Germany. For his contributions to scholarship and to education in German studies he was awarded the Medal of Merit of the Federal Republic of Germany in 1959, and in 1960 the Silver Medal of the Goethe-Institut in Munich. He was also the first recipient of the Lloyd W. Dinkelspiel Award for oustanding service to undergraduate education at Stanford.

His varied scholarly interests are also reflected in his publications. He is best known for his coauthored textbooks, *German Reading Grammar* (1940), *Reading German* (1943), and *German: A Structural Approach* (1967), which has enjoyed three editions and has been used in more than 500 universities and colleges. In addition, he published articles on Germanic philology, on Herder and T.S. Eliot, and, as general editor of the Milestones of Thought series, issued by Frederick Ungar Company, brought out selections from the writings of St. Augustine and Jean Calvin.

As teacher, administrator, student of philology and philosophy, and educational innovator, F.W. Strothmann has bequeathed a heritage to Stanford that will long survive his more than fifty years as a leading member of the university community.

26066-BP (JCC:2596) SECY II-SPEC Sec/Word Processor for 4 teaching faculty members & a Res Assoc for grad Construction Program in Dept of Civil Engrg; heavy typing incl tech reports, course mat'ls, res reports, genl corresp; ordering of offc supplies & handling cash deposits; xeroxing; asst in organizing conferences & mtgs; willing to learn/use DPD Word-11 Word Processing Sys on A DEC PDP-11 computer; interact w/ students, faculty, staff, & visitors; QUALIFICATIONS: typ 65; typing speed & accuracy important; ability to commu effectively in person & on phone; prev exp required; prev word processing exp strongly desired; send appl/resume to John W. Fondahl, Terman Engineering, Room 294.; B12; $1310-1373.

'Glory days' of surburban papers have passed, Rosse tells editors

The "glory days" of strong suburban newspapers "probably have passed," Prof. James Rosse of the Stanford Economics Department told the Northern California chapter of Sigma Delta Chi in San Francisco Thursday night, Sept. 23.

Director of the newly-formed Center for Economic Policy Research, Rosse has frequently been an expert witness in newspaper mergers and joint operating agreements.

Competitive newspaper markets are "extremely unstable," he said. "When one paper loses its circulation edge, a vicious circle of lower advertising revenues and declining circulation quickly develops.

"People buy newspapers to read advertisements," he said. "I hate to say that, but it's true."

His own studies, dating from the mid-1960s, show that the amount of news space a newspaper provides is the most important single factor in estimating its market demand. Advertising is about two thirds as important.

Editorial quality also is "quite important," he said. To measure this, Rosse divided total editorial expense by the number of inches of news published. The results were "extremely consistent...and really incredible," ranging from as low as 15 to 20 cents per inch in papers which simply filled their pages with wire service copy to $10 or more for *The New York Times*.

Rosse said rapidly rising newsprint prices and technological change were key factors in the recent rash of failures among large city papers. Higher newsprint prices following the 1973 oil embargo "hurt everybody," but especially large city newspapers, where newsprint is a major share of total expenses.

New technologies have been a "great blessing," but also tend to help smaller papers at the expense of bigger ones. As their production costs have risen less rapidly, there's been a tendency for advertisers and reading audiences to shift toward smaller newspapers.

The San Francisco Chronicle is "no longer competitive out in the country," for example, and the *Minneapolis Star-Tribune* has greatly curtailed remote circulation since he worked there as a student years ago.

Being No. 1 counts

In competitive cities, "not a lot is explained" simply by whether a newspaper publishes in the morning or the afternoon, he added. "Whichever's ahead is what counts."

The recent demise of *The Washington Star* could be followed in New York by the *Daily News*. Despite its large circulation, it may no longer have a clear market segment. "It looks a little more like *The New York Times*," Rosse said. "That's a sign it's in trouble."

Afternoon newspapers tend to be "better off" in the West, since they have more time to report the day's news from the East. "Honolulu is the best example of that," Rosse said.

While they may remain strong well into the next decade, larger suburban newspapers may have passed their peak. "*The Palo Alto Times* probably was stronger relative to its market" than its successor, *The Peninsula Times-Tribune*" will be in the future, he said.

Newspapers like the *Hayward Review* and *San Rafael Independent-Journal* are relatively insulated from television, enjoy a monopoly position in local markets and have good density of circulation, "a powerful combination," he observed.

Their position faces a clear long-term threat from the combination of computers, cable television, and other technologies capable of delivering saturation coverage in a well-defined community. That threat is "some distance off" but "sooner or later it will come."

Many suburban papers already face competition from weeklies, throwaways, and total market coverage papers, he added. *The Palo Alto Weekly* is "a very successful paper."

Leonard Koppett, editor of *The Peninsula Times-Tribune* disagreed that weeklies threatened dailies. While weeklies are competition, "I can't see any way a weekly can replace a daily. They're apples and oranges."

Rosse replied that weeklies can "whittle away" the revenue base of dailies, making them more vulnerable.

Koppett, Rosse, and Lawrence Walker Jr., vice-president and business manager of the San Francisco Newspaper Agency, all agreed that newspapers need stronger business management.

"Editors no longer determine how many" reporters will be hired, although they do control who is actually picked, Koppett said.

While job opportunities for journalists are not shrinking as fast as the demise of bigger papers might suggest, there probably will be fewer openings when the economy improves and employment freezes end, he added. Newspapers will have smaller staffs, but try to do more with them.

News up, classifieds down

Walker said the San Francisco Newspaper Agency, which jointly operates the business side of both *The Chronicle* and *The Examiner*, expects to finish its new East Bay printing plant in Union City by January, 1983. No news office will be located in the plant, but news editors plan to "greatly beef up" coverage in the West Bay.

If better zoned editions can be developed in the East Bay, both papers may improve their circulation coverage there. There probably is greater growth potential for *The Examiner* than *The Chronicle*. But the greatest single advantage will be more timely delivery of their Sunday editions.

While the new plant is located near San Jose, that market is not a primary target, he indicated. But the location "gives us some flexibility there we haven't had before," Walker admitted.

He said the two papers had published 600 more pages of news this year, despite losing 25 to 30 percent of their classified advertising lineage."

Rental housing

HOUSING AVAILABLE

□ **Oct. 1, '82 to Jan. 10, '83:** Luxurious 2BR/2BA condo dwntwn Los Altos. Compl. furn, 10 min. to Stanf. $950/mo. Call (415) 948-1240.

□ **NOW:** Cultured woman from France has penthouse apt. to SHARE. Sharon Hts, rm. w/priv. BA + study/den. Kitchen priv., decks w/view, gar., pool, sauna. Nonsmoker pref. $500/mo. + ½ util. Call (415) 591-8015 (lv. message) or (415) 592-6885.

□ **NOW:** Tranquil oasis 9 min. to Stanf. Priv. guest-wing rear of Eng. cott. Sep. entry, 1BR (king size bed)/1BA. Fully furn. incl. linens, dishes, TV, phone, util, grdnr. LR w/frpl. Fenced grdn/patio. Driveway parking. No pets, nonsmoker, 1 person only. RENT by mo. Call (415) 856-0608.

Neurology seeks research associate

Position available for research associate in neural ultrastructure in Department of Neurology, Stanford University School of Medicine.

This position is for an individual with the Ph.D. or M.D. degree, who will take part in ongoing studies on development and plasticity of neuronal membranes. Experience in ultrastructure is essential, and previous work in freeze-fracture and/or cytochemistry is desirable.

Send curriculum vitae, reprints, and names of three references to Stephen G. Waxman, M.D., Ph.D., Neurological Unit (127), VA Medical Center, 3801 Miranda Avenue, Palo Alto, CA 94304. An affirmative action/equal opportunity employer.

Houle's views on early music...

continued from page 13

the ones used in a particular solo. That was it. From then on the oboe was my instrument, and I played regularly.

"I became enamoured of the oboe, and have been ever since. It is a superb instrument, capable of a wide range of expression."

Houle was educated at Stanford, where he gained successive degrees ending with a Ph.D. in 1961. After musicological research in Europe Houle taught successively at Mills, Colorado, and Minnesota. He joined Stanford as an assistant professor in 1962.

Soon after coming to Stanford he began to develop courses in Rennaissance and Baroque music. He came under the influence of Putnam Aldrich.

Houle played such ancient instruments as the shawm, viola da gamba, recorder, baroque oboe, cornett and krummhorn. However, he could not find time amid larger commitments to play them as well as they deserved, so he concentrated on the oboe.

In 1972 Houle assumed leadership of New York Pro Musica, a renowned professional ensemble playing early music; he took leave from Stanford to do so. this group was the first in the nation to revive at a high level the music of the Middle Ages and the Renaissance.

"Only after listening to and playing with Pro Musica did I realize the full extent of what was possible in early music. I spent two years directing and touring with it, and they were important years of my life."

Houle teaches both graduates and undergraduates. His courses include performance in Rennaissance music. introduction to performance practices, and the history of musical instruments and of music itself. He also teaches general students in such courses as Music I. He tends to specialize in the Baroque era.

Ever since his marriage 14 years ago to Glenna Mount, whom he met at Esalen, at Big Sur, the couple have shared many musical experiences. In addition to her playing, she signs in the choir at St. Anne's, Palo Alto.

Houle will play the oboe at a memorial concert for Jason Paras on Oct. 2 (see page 27) and conduct the Stanford Baroque Ensemble in a concert on Nov. 14.

'Great Race' runners on Oct. 3 will fund award for woman athlete

As many as 3,000 runners are expected on Sunday, October 3, in the fifth annual Great Race at Stanford.

Sponsored by Western Federal Savings, the race has become one of the most popular ones in the area for celebrity runners as well as the general public.

Proceeds from the Great Race are used to fund women's athletic scolarships at Stanford University.

The race will have a novel innovation this year: videotape playbacks of the winners will be shown while the results are being compiled before the awards ceremony.

"Most of the runners in the race wouldn't get a chance to see the finish because they're back in the pack," race director Oz Crosby said. "Now they will be able to see it all."

Crosby asserted that the race isn't designed just for the elite runners. "This is a race for the ordinary runner, too." he said. "It's a mostly-flat course and it gives ordinary runners the chance to run with many well-known athletes."

Entrants need not test themselves on the 10K course; there's a 2.5 km (1.55 mi.) "fun run" that starts half an hour before the longer race. The fun begins at 8:30 and the 10K event at 9 a.m.

Well-known runner Nancy Ditz (assistant to the director of the Alumni Association) has summed it up succinctly, "The race is scenic, flat, fast, and for a good cause." As the former director of the Cardinal Club, she is most concerned with the latter. "The Great Race has raised over $25,000 to date for women's athletic scholarships," she said.

The Cardinal Club and the Great Race both started five years ago, according to director Donna Tepe Garton. At that time, Western Federal's. Vice-Chairman of the Board (and Stanford grad) Henry Duque decided that something needed to be done to fund women's athletics.

Duque and his friend Joe Reutz, Stanford's retired athletic director, finally came up with the idea of the Great Race. Each year since 1978, race proceeds have paid for a scholarship for one talented female athlete.

Among the runners will be Stanford President Donald Kennedy, San Francisco Marathon winner, Nancy Ditz, Congressman and Mrs. Pete McCloskey, and other outstanding names in the running world—Jackie Caselli, Duncan McDonald, Derek Clayton, Len Wallach, Tony Sandoval, Peanut and Tena Harms, Skip Brown, Patrice Cross, Hal Schulz, Glynn Reynolds, and Tom Laris.

The grand prize is a Zenith color console television donated by Matteson Investment Corp. The top male finisher gets a new Camaro for three months free from Ely Chevrolet. The top woman runner receives a 14-karat gold necklace donated by Thomas L. Broadwin Ltd. All first-place winners of the seven age categories receive Amfit custom-fit running shoes, and all second and third-place winners will receive prizes.

the entrance fee is $7 ($10 after September 24) and includes a Great Race t-shirt. Refreshments have been donated by Dole bananas and Calistoga Mineral Water. Advance registration is at the Stanford Athletic Department or at Western Federal Savings office in the Stanford Barn at 700 Welch Rd., Palo ALto, 94304. For inoformation, call (415)

Aerobic dancing offered by HIP

Aerobic exercise, with or without music, and a coed early morning stretch will be offered this quarter by the Health Improvement Program (HIP).

Aerobic dance (with music) will meet 1:10-2 p.m. Tuesday and Thursday in the Encina Gym wrestling room, beginning Oct. 12. An evening section will be held 5:30-6:30 p.m. Monday and Wednesday in the I-Center assembly room, beginning Oct. 13.

Aerobic exercise without music will be given 12:10-12:50 p.m. Tuesday and Friday in Room W001 at the Medical Center, beginning Oct. 13.

The coed early morning stretch is a program that includes calisthenics to music for stomach, back, legs, and arms, appropriate for pre- and postnatal women, and back strengthening as a supplement to running. It will meet 7:30-8:10 a.m. Monday, Wednesday, and Friday in Roble Gym, beginning Oct. 11.

The registration fee for the classes is $20 per quarter. Send name, campus address and phone number, and choice of class along with a check payable to Stanford University to HIP, 730 Welch Road. For further information, call 497-7940.

Roble Pool closed by strike action

Roble Pool, slated to open Monday, Sept. 27, will not open for at least a week, reports recreation coordinator Shirley Schoof.

Those who usually maintain the pool and get it ready for opening are on strike. The de Guerre Pools have remained open through the efforts of manager Rick Schavone.

Watch Campus Report for notice of Roble's opening or call Roble Gym, ext. 7-4895.

Travel film series opens on Oct. 4

"Egypt," Eric Pavel's travel film will open Stanford University's 1982-83 Discovery Film Series at 2:30 p.m. Monday, Oct. 4 in Kresge Auditorium and at 7:45 p.m. in Memorial Auditorium.

The Discovery Film Series features nine travel films personally narrated by their producers. The following films are also included in the series. "The River Thames" with Bill Madsen, Nov. 1; "Morocco" with Clay Francisco, Dec. 6; "The Danube—Vienna to the Black Sea" with Gene Wiancko, Jan. 3; "Inside Passage to Alaska" with Scotty Armstrong, March 21; "Belgium" with Kathleen Dusek, April 4; and "Holland" with John Roberts on May 2.

Each film is presented twice—at 2:30 p.m. in Kresge Auditorium and again at 7:45 p.m. in Memorial Auditorium. Series tickets and single tickets for both the matinee and evening performance are now available. For ticket information, call Tresidder Ticket Office, (415) 497-4317. The Discovery Film Series is presented by University Events and Services.

Hear lectures on many topics

Experts in experimental techniques

The Applied Physics 395 lectures on Experimental Techniques in Lasers and Optics, beginning Monday, Oct. 4, with speaker Gary Bjorklund of IBM, are open to the community.

The lectures, all at 4:15 p.m. Mondays in Applied Physics 200, are:

Oct. 4—Dr. Gary Bjorklund of IBM, San Jose, "Progress in Frequency Domain Optical Memories;"

Oct. 11—Dr. Donald Scifres of XEROX PARC, Palo Alto, "High Power Phase-Locked Semiconductor Laser Arrays;"

Oct. 18—Dr. Robert Eckardt of the Naval Research Laboratory, "Mid-Infrared Rare Earth-Doped Solid State Lasers;"

Oct. 25—Dr. Narinder Kapany of Kaptron, Palo Alto, "Interface Devices for Fiber Optic Communications;"

Nov. 1—Prof. Hyatt Gibbs of the University of Arizona, "Optical Bistability and Chaos;"

Nov. 8—Dr. Andrew Tam of IBM, San Jose, "New Uses of Light Generated Sound;"

Nov. 15—Dr. Ronald Schmidt of XEROX PARC, Palo Alto, "Fiber Optic Networks;"

Nov. 22—Prof. Yuen-Ron Shen of UC-Berkeley, "Highly Nonlinear Effects in Liquid Crystals;"

Nov. 29—Dr. Richard Caro of Stanford, "Excimer Lasers and Their Uses;"

Dec. 6—Prof. Michael Bass of USC, "Intensity Dependent Absorption/Laser Damage in Various Materials."

Questions should be addressed to Philippe Fauchet, Ginzton Lab, Room 52, ext. 7-0115 or 7-1992.

Series features 'Women at the Top'

"Women at the Top: The Issues They Face" will be presented at Stanford this fall by the Center for Research on Women.

Donna Shalala, president of Hunter College, will present the opening lecture of the Jing Lyman lecture series in Kresge Auditorium, 8 p.m. Tuesday Oct. 5.

The other speakers include the following:

Prof. Margaret Burbidge, director of the Center for Astrophysics and Space Sciences at UC-San Diego, at noon Wednesday, Oct. 13 in Terman Auditorium.

Marion Sandler, president and chief executive officer, World Savings and Loan Association, at noon Wednesday, Oct. 20 in Terman Auditorium.

Ruth Bader Ginsburg, judge, U.S. Court of Appeals, District of Columbia circuit, at noon Monday Nov. 1, in Terman Auditorium.

Liz Gallese, staff reporter, *Wall Street Journal*, at noon Wednesday, Nov. 10 in Terman Auditorium.

Congresswoman Pat Schroeder of Colorado, 8 p.m. Tuesday, Nov. 30 in Kresge Auditorium.

Coordinator of the lecture series is Margo Davis, assistant director of the Center for Research on Women. Further information may be obtained from CROW at (415) 497-1994.

Third World problems to be aired

David Abernethy, professor of political science at Stanford, will open this year's Tuesday luncheon/lecture series at noon on Oct. 5 at the Bechtel International Center. His topic is "Contemporary Third World Problems: The Colonial Legacy."

The popular International Center on-going program, which now begins its seventh consecutive year of presenting weekly speakers on international topics, will focus during 1982-83 on major world issues. This quarter speakers will interpret the historical backgrounds of problems which impede peaceful resolution of political and social conflict. During winter quarter programs will focus on more specific regional and issue cases, and in the spring, on ideas and plans for the resolution of acknowledged problems.

Future confirmed speakers are Gafar Adamola Olaniyan, night editor of the *Nigerian Herald*, Ilorin, Nigeria, who will address "The Legacy of Colonialism from an African Perspective" on October 12, and Kirk Hanson, lecturer, Stanford Graduate School of Business, who will discuss "Corporations and World Poverty" on October 19.

Tickets at $2.50 for each luncheon meeting are on sale at the International Center one week in advance and are limited in number; brown baggers are also welcome at no charge. For more information, phone 497-1831.

Seven profs in geothermal seminars

Radar, magnetics, and volcanoes will be among the topics discussed during the Stanford Geothermal Program, a series of seminars to be held from 1:15-2:30 p.m. Thursdays from Oct. 7 to Dec. 16 in Room B67 of Stanford's Mitchell Building.

Sponsored by the Petroleum Engineering Department, the seminars will feature lectures by seven Stanford professors. The schedule of speakers and their topics is:

Oct. 7: Prof. Ronald J.P. Lyons, applied earth sciences, "Evaluation of Remote Sensing in Study of Japanese Geothermal Resources: Radar, Landsat and Airborne Magnetics."

Oct. 21: Prof. Mark A. Miller, petroleum engineering, "Relative Permeability Investigations."

Oct. 28: Prof. George A. Parks, applied earth sciences, "Low Temperature Geothermometry."

Nov. 4: Prof. Lewis Semprini, civil engineering, "Radon Transport in Two-Phase Reservoirs."

Nov. 11: Prof. Gail A. Mahood, geology, "Silicic Volcanic Centers Supporting Geothermal Systems in the Mexican Neo-Volcanic Belt."

Nov. 18: Prof. Stephan T. Lam, mechanical engineering, "Heat Extraction Modeling."

Dec. 2: Prof. Amos M. Nur, geophysics, "Geophysical Monitoring of Vapor-Liquid Interfaces in Reservoirs."

The program ends with the 8th Geothermal Reservoir Engineering Workshops, Dec. 14-16.

Diana Peterson in flute concert

Diana Peterson, flutist, will perform at 8 p.m. Sunday, Oct. 10 in Tresidder Lounge.

Sponsored by the Music Department, her free concert will include Handel's *Sonata in B minor* for flute and harpsichord, Mozart's *Andante in C* for flute and piano, *Acht Stucke* for solo flute by Hindemith, *Sonata for flute and harp* by Damase, and Bartok's *Suite Paysanne Hongroise* for flute and piano.

Joining Peterson will be John Toenjes, harpsichord; Dan Levitan, harp; and Jeff Williams, piano.

Peterson is a senior at Stanford studying flute with Frances Blaisdell and majoring in "philosophy and logic of formal systems"—a program which combines the study of philosophy, logic, linguistics, and computer science. Last year she was in Vienna with the Stanford Overseas Program.

From San Carlos, Peterson has also studied with Maria Tamburrino, principal flute with the San Jose Symphony. Two years ago Peterson soloed with the Stanford Symphony.

Her piano accompanist, Jeff Williams, is a student of Adolph Baller.

Dramatists set two auditions

Auditions will be held for two Stanford Drama Department productions, Brecht's *The Good Soul of Setzuan* and Shaw's *Arms and the Man*, at 7 p.m. Wednesday, and Thursday, Sept. 29-30 in Little Theater.

The Good Soul of Setzuan will be directed by Geoffrey Reeves, the English director who last year directed *The Recruiting Officer* and the Spring Quarter Nitery production of *King Lear* for the Drama Department.

The Good Soul of Setzuan is a parable play set in China about the search of the gods for a good person. Reeves will use the Paul Dessau musical score and there are roles for over thirty actors, singers and non-singers. Production dates in Little Theater are Nov. 9-13; the play replaces Brecht's *Turandot* originally scheduled at that time.

George Bernard Shaw's *Arms and the Man*, directed by second-year doctoral student Stephen Weeks, was Shaw's first theatrical success and has maintained its popularity. It demonstrates the playwright's mastery of sharp characterization and witty dialogue and provides challenging roles for three women and four men. The play explores the conflict between realism and romanticism and the subtle and shifting balance of realism and idealism in human experience. Production dates in the Nitery are Dec. 1-4.

Auditions for both plays are open to all with priority casting given to Stanford students and staff. No preparation is necessary. For further information, please call 497-2576.

Cap & Gown calendars

The 1983 Stanford Calendar, published by Cap and Gown, the Stanford women's honorary society, and featuring hitherto unpublished photographs by Leo Holub, is now on sale at the Stanford Bookstore.

Proceeds from the sale benefit the Cap and Gown Scholarship Fund.

Eric Hoover

Eric Hoover plays flute on Oct. 9

The Stanford Music Department and the Bay Flute Club present flutist Eric Hoover Saturday, October 9, in Annenberg Auditorium.

Hoover, visiting from Arizona State University, will give a master class at 2 p.m. and a free recital at 8 p.m. On his evening program are works by La Montaine, Hindemith, Robertson, Moyse, Reinecke, and Genin.

Hoover is professor of flute and member of the Gammage Woodwind Quintet, in residence at Arizona State. During the summer he is principal flute at the Brevard Music Center in North Carolina.

Hoover has been a member of the U.S. Army Band and principal flute with the San Antonio Symphony Orchestra.

Stoner concert with Wodehouse

Martin Stoner, violinist and Stanford A.B. '71, will perform with pianist Artis Wodehouse at 2:30 p.m. Sunday, Oct. 10, in Tresidder Lounge. His free concert is sponsored by the Stanford Music Department.

Stoner and Wodehouse will perform *Ciaccona for violin and piano* by Vitali-Auer, Beethoven's "Spring" sonata, Kreisler's *Praeludium and Allegro*, and Sonata in D minor, op. 108, by Brahms.

Stoner also holds a masters degree from Juilliard, where he studied with Ivan Galamian and Sally Thomas. He is currently a member of the New York City Ballet Orchestra, the Brooklyn Philharmonic, and the White Plains Symphony. He has also performed in solo and chamber music recitals at Lincoln Center and Carnegie Hall, and on radio and TV.

Wodehouse, who performs frequently in the Bay Area, received her D.M.A. from Stanford in 1977.

Tennis classes continue

Tennis lessons (six pupils per group) will again be offered to graduate students, staff, and/or their families on weekday mornings *or* Saturday mornings.

Players are grouped by ability in these classes taught by Dick Gould's staff. Call 497-1160 on weekday mornings to receive detailed printed information and registration form. Lessons begin the week of Oct. 9.

Memorial concert for Jason Paras slated Saturday

A concert of baroque and medieval music in memory of Jason Paras, who died July 14, 1982, will be presented by the Stanford Department of Music at 8 p.m. Saturday, Oct. 2, in Dinkelspiel Auditorium.

Performers will include George and Glenna Houle, Margaret Fabrizio, Sally Sanford, and John Toenjes.

Paras, Stanford D.M.A. '78, was a gambist and medieval string instrument player of the highest promise. At the time of his death he was teaching at the Schola Cantorum in Basel, Switzerland, and had accepted a position at Indiana University for this year. He drowned while swimming with friends in the Rhine River.

Paras taught briefly for the Department of Music before going to Europe to establish his performing career. "The promise he displayed was cut short before a wide public knew of his marvelous talents, noted Music Prof. George Houle, "but his friends at Stanford were aware that they made music with a musician of extraordinary talent during the years he studied, played, and taught here."

The memorial concert music is connected with Paras, either because he played, studied, or taught it, or because he inspired it through his interests and abilities.

Robert Strizich has written *Tombeau* in memory of Paras for baroque flute and harpsichord, to be played by Janet See and Margaret Fabrizio. Evocations of music from Paras's life are to be found in it, from the jazz he played on his guitar through the medieval and baroque improvisations he loved to bring to life.

John Toenjes will perform a group of variations on the *bascia fiamignia* by Antonio Valente—a melodic fragment upon which harmonies and melodies are elaborated, first by the composer and further by the player. Houle remembers many evenings with Jason playing variations on just such a pattern.

Sally Sanford, D.M.A. '79, will sing medieval songs she was to have performed with Paras this year.

Monteclair's cantata *Pan & Sirinx*, a work Paras played with the Stanford Baroque Ensemble, will be performed by Deborah Barney, Jonathan Salzedo, and Glenna and George Houle.

Through this music a portrait of Jason Paras, as his friends remember him in music, will be attempted.

Gifts in memory of Paras may be sent to the Jason Paras Memorial Early Music Fund at Stanford c/o the Department of Music.

Faculty Women's Club to welcome newcomers

The Newcomer's Section of the Stanford Faculty Women's Club invites new female faculty members and wives of new or visiting scholars or faculty to a coffee at 10 a.m., Tuesday, October 5 at Dale Mnookin's house, 430 El Escarpado, Stanford.

The aim of this section is to help make the year a good one by making new friends and becoming acquainted with the campus and surrounding area. Activities are planned for the second Tuesday of every month. For more information call Caroline Pease, 857-1472, or Dale Mnookin, 328-1430.

Mayumi Ohira

Alma Trio sets concert Oct. 8

The Stanford Music Department presents the Alma Trio and Guests at 8 p.m. Friday, Oct. 8 in Dinkelspiel Auditorium.

The trio was founded 40 years ago by pianist Adolph Baller and cellist Gabor Rejto. Violinist Andor Toth joined in 1963. Among world-class groups, it has the distinction of being the longest-established trio performing today.

The "Ghost" trio of Beethoven, a perennial favorite, will open the concert, followed by Kodaly's stunning Duo for violin and cello.

Joining the Alma Trio for Dvorak's Quintet in A Major, op. 81, will be Don Ehrlich, violist with the San Francisco Symphony and the Aurora String Quartet, and Mayumi Ohira, violinist.

As concertmaster of the Tanglewood Festival Orchestra, Ohira recently won the Joseph Silverstein Award for most outstanding player at the festival. She has soloed with the Marin and Modesto symphonies and the Carmel Bach Festival Orchestra.

Toth has just returned from a solo recital tour, including appearances at Schoenberg Hall in Los Angeles and Merkin Concert Hall in New York.

The *Los Angeles Times* said of his concert: "Playing this committed is seldom combined with playing this clean; instead of contradiction, however, what one hears in Toth's performance is pure music."

Tickets are $4 general, $2 students and senior citizens, available at Tresidder Ticket Office (497-4317).

Hillel builds Sukkah in Union courtyard

In celebration of Sukkot, the Jewish Festival of the Harvest, Stanford Hillel is building a Sukkah in the courtyard of the Old Union Building, Stanford campus, The Sukkah will hold over 100 people, and Hillel is planning a variety of events to be held in it. Desserts will be served at 6:30 p.m. in the Sukkah from Monday, October 4, through Thursday, October 7; programs will follow. There is no admission charge.

On Friday, October 8, Liberal Shabbat Services will begin at 7 p.m. in the Old Union Clubhouse. An Oneg Shabbat, featuring storytelling with Peretz Wolf Prusan, will follow in the Sukkah.

For more information on these and other programs, please contact Stanford Hillel at 497-1602.

Some freshmen complain of dirty rooms, inconveniences stemming from strike

The first students to arrive on Stanford's campus for fall quarter Thursday, Sept. 23, voiced differing opinions on the extent to which the strike by the University's technical, service and maintenance employees has affected them.

"Things have certainly gone as well as we could have hoped for," said Bart Carey, a sophomore resident adviser from Palo Alto. "The strikers have not been very visible, and they have caused us no problems."

Other students complained of inconveniences caused by the strike, however. In 15 interviews, soon after students began arriving in their dorms, none voiced strong support for the union.

"Some of the rooms in Stern are really dirty, dusty and gross," according to Debbie Pagangis, a resident adviser from San Jose. "We have had problems with broken fixtures and things, and we can't get anything repaired."

Laura Keller, a freshman from Sunnyvale, said, "Some of the rooms obviously weren't cleaned very well before we got here. There were bits of garbage scattered around some of the rooms."

The reluctance of outside workers to cross Stanford picket lines is also causing difficulty for students. They cannot have packages sent to Stanford by United Parcel Service delivered, and they have to pick up their phones in downtown Palo Alto instead of on campus, as they normally would.

Most students said they were satisfied with the Food Service, which is being operated by student workers, and supervisors and managers who are not part of the striking union. But some mentioned that they thought service suffered because of lack of sufficient staff.

"The thing that makes me mad is that the union struck just as the freshmen were about to arrive. We have so much that's new to deal with, having this added to it just makes everything that much harder for us," Keller said. The strike started Sept. 10.

Pagangis said, "Maybe I'm wrong, but a 9½ percent increase doesn't sound bad to me. It appears that (the union) is using the students to put pressure on the University, and I don't like that. The students are the ones who are suffering, and we have nothing to do with it."

Freshman Chip Overstreet thinks the students can handle the loss of services "as long as it doesn't go on too long. There won't be anyone to clean out the bathrooms and things like that until the strike is over, but we can take care of ourselves. I really don't think the strike will affect us if we don't let it."

—Phil Taylor

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Sept. 29 to cover the week of Mon., Oct. 11 through Sun., Oct. 17.

LATE ANNOUNCEMENTS

Thurs., Sept. 30. Solid Mechanics Seminar: "History of Composites in Aircraft Structures" with Prof. N. J. Hoff, S.U. 4:15 p.m. Skilling Aud.

Ecumenical Ministries Open House: These ministries are UCCM, Newman, Episcopal, Memorial Church and Lutheran Center. Meet staff and students and hear about fall programs. 4:15 p.m. Old Union Courtyard.

MONDAY, OCTOBER 4

Computing Seminar: CIT orientation for beginning users. 10 a.m. Information at 497-4329.

Discovery Film Series: "Egypt" with Eric Pavel. 2:30 p.m., Kresge Aud., $3; and at 7:45 p.m., Memorial Aud., $4.

Numerical Analysis Seminar: "The Accurate Numerical Solution of Higher Oscillatory Ordinary Differential Equations" with Robert Scheid, Jet Propulsion Laboratory, Pasadena. 4:15 p.m. Mathematics Basement 380C.

Stanford Film Society: "Four Hundred Blows." 7 p.m. Kresge Aud. $1.50.

Biological Sciences Dept. Seminar: "Biogenesis of Chloroplast Components" with Dr. Arthur Grossman, Dept. of Plant Biology Carnegie Institution. 4 p.m. Herrin Hall, T175.

TUESDAY, OCTOBER 5

Bechtel International Center Tuesday Lunch/Lecture Series: "Contemporary Problems in the Third World: The Colonial Legacy" by Prof. David Abernethy, Political Science Dept. Noon. $2.50 includes lunch. Tickets on sale in advance. Brown baggers also welcome. I-Center.

Computing Seminar: CIT orientation for experienced users. 1:15 p.m. Information at 497-4329.

Varsity Soccer: Vs. UC-Santa Cruz. 2:30 p.m. Maloney Field.

Fluid Mechanics Seminar: "The World's Largest Wind Tunnel; Design Rationale and Construction" with Kenneth W. Mort, NASA-Ames Research Center. 4:15-5:30 p.m. Skilling Aud.

Computer Science Colloquium: "Experience in the Design and Implementation of an Integrated Network and Distributed Operating System Architecture" with Richard Watson, Lawrence Livermore Laboratory. 4:15 p.m. Jordan 040.

Applied Physics Colloquium: "Experiments in Catastrophic Behavior in Nonlinear Systems" with Dr. F. Neville, prof. of physics, Oxford University. 4:15 p.m. Applied Physics 200.

CROW Women at the Top Lecture Series: The speaker is Donna Shalala, president, Hunter College, NY. Topic to be announced. 8 p.m. Kresge Aud. Public invited.

WEDNESDAY, OCTOBER 6

Computing Seminar: CIT orientation for experienced users. 9 a.m. Information at 497-4392.

The Archive of Recorded Sound Sale: Over 2,000 new and used duplicate LP's. Classical, jazz, pop, etc. 10 a.m.-5 p.m. Music Bldg. lobby on the Knoll. 25 cents to $2/disc.

Book Sale: Books and periodicals in many fields. Hardbound $1 and up, paperback 25 cents and up, periodicals 10 cents. 11 a.m.-1:30 p.m. Green Library, West Wing, 1st floor, Room 101.

UCCM Lunch Discussion: Social Responsibility and Obligation in Today's Economy" with Dr. Robert McAfee Brown. Noon. Casa Zapata (Stern Hall) dining room. Bring bag lunch or arrange to eat at Zapata. Directed reading credit available. (First in a weekly series of eight.)

Computing Seminar: CIT orientation for beginning users. 1:15 p.m. Information at 497-4392.

Electronics in Medicine Seminar: "Chemically Sensitive Field Effect Transistors for Physiologic Applications" with David Harame, Electrical Engineering Dept. 4:15 p.m. McCullough 134.

Colloquium of the Dept. of Chemical Engineering: "Zeolites, Chemistry and Catalysis" with Dr. Pierre Gallezot, Centre National de la Recherche Scientifique, France. 4:15 p.m. Chemical Engineering Conference Room.

Overseas Studies Program/Casa Italiana/Dept. of French and Italian Lecture: "Semiotics and Mass Media" by Umberto Eco. 8 p.m. History Corner, Room 2. Open to all. Reception follows at Casa Italiana, 582 Mayfield Avenue.

THURSDAY, OCTOBER 7

Rhodes/Marshall Scholarship Deadline: Applications are due at noon, Overseas Resource Center, 2nd floor, I-Center. Further information at 497-0856.

The Archive of Recorded Sound Sale: See details for Wed., Oct. 6.

Stanford Geothermal Program Seminar: "Evaluation of Remote Sensing in Study of Japanese Geothermal Resources: Radar, Landsat and Airborne Magnetics" with Ronald J. P. Lyons, Applied Earth Sciences Dept. 1:15-2:30 p.m. Room B67, Mitchell Bldg.

Solid Mechanics Seminar: "Recent Developments in Elastic-Plastic Crack Growth" with Prof. James Rice, Harvard Univ. 4:15 p.m. Skilling Aud.

Condensed Matter Physics Seminar: "Electron Band Theory in High Pressure Physics" with Dr. Andrew K. McMahan, Lawrence Livermore Laboratory. 4:15 p.m. Applied Physics 200.

Yoga Seminar: "The Complete Science of Yoga" with Rene Ochoa. 7 p.m. History Corner (Main Quad) Room 217. Public invited.

Women's Volleyball: Vs. San Diego State. 7:30 p.m. Maples Pavilion.

I-Center Other Cultures Film Series: "The Human Face of Japan." Three parts of a new film show the character of a nation through the lives of a handful of Japanese people. "Lifetime Employment" in the Mazda assembly line; "Tomorrow and Yesterday" shows contrasts in child rearing; "Raw Fish and Pickle," life in the salmon boats. 7:30 p.m. I-Center. 75 cent donation at the door.

Overseas Study Program/Casa Italiana/Dept. of French and Italian Lecture: "The Italian Communist Party and the World Crisis Today" by the Mayor of Florence, Elio Gabbuggiani. 3 p.m. Casa Italiana, 562 Mayfield Avenue. All interested in Italy and Florence invited.

FRIDAY, OCTOBER 8

Water Polo: Vs. San Francisco State. 3 p.m. deGuerre Pool.

Applied Mathematics Lectures: "Inverse scattering in two dimensions" by Dr. Margaret Cheney, Mathematics Dept. 3:15 p.m. Room 380C (Mathematics Corner Basement).

Materials Science and Engineering Dept. Colloquium: "Titanium Alloy Blades for Low Pressure Steam Turbines" with Dr. R. I. Jaffee, EPRI. 3:30 p.m. Peterson Laboratory, Room 550A.

Liberal Shabbat Services: Begin 7 p.m., Old Union Clubhouse. An Oneg Shabbat, featuring storytelling with Peretz Wolf Prusan follows services and will be held in the Sukkah in the courtyard of the Old Union Bldg. More information on this and other programs, call Stanford Hillel, 497-1602.

SATURDAY, OCTOBER 9

Men's and Women's Cross Country: College Invitational. 11 a.m. Stanford Golf Course.

Water Polo: Vs. UC-Berkeley. 11 a.m. deGuerre Pool.

Field Hockey: Vs. Long Beach State. 11 a.m. Roble Field.

Bill Graham/Chaparral Present: The Grateful Dead. 2 p.m. Frost Amphitheater. $12 in advance, $13.50 at the gate. Stanford students will receive a $1 additional discount at Tresidder Ticket Office on tickets which go on sale Sept. 28.

SUNDAY, OCTOBER 10

University Public Worship: Student Worship Service, 8:30 a.m.; Robert G. Hamerton-Kelly, dean of the chapel, 11 a.m.; Evening Communion in the Round Room at rear of Memorial Church, 6 p.m.

Bill Graham/Chaparral Presents: The Grateful Dead. See details for Sat., Oct. 9.

ASSU Sunday Flicks: "Star Wars." 4:30 p.m., 7 p.m., 9:30 p.m. Memorial Aud. $1.50.

EXHIBITS

Paul Harris—Still Life. Stanford Museum. Through Jan. 2.

Venice in the Eighteenth Century. Paintings, drawings, prints and decorative arts. Stanford Art Gallery. Oct. 5-Dec.19.

The Map as Landscape. Familiar and new aspects of Western landscapes by Donna Van Dijk. Reception, Fri., Oct. 8, 5-7 p.m. Bechtel International Center. Oct. 4-31.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through Nov.

Thirty Miles from Stanford. Photographs by Paul Berger. Tresidder 2nd floor gallery. Month of October.

Paintings on Canvas by David Cusic. Coffee House Gallery. Month of October.

Note: The Museum and Art Gallery will be closed until strike is resolved.

VISITORS FROM OTHER COUNTRIES

Oct. 4: Prof. Arnulfo M. Nadela, dean of the School of Engineering, CEBU Institute of Technology, the Philippines.

Oct. 5: Mr. Michael Franzke, program director, West German Broadcasting Corp. in Cologne.

Oct. 6: Group of 13—Economists from Japan.

Oct. 7: Prof. Shujiro Kato, comparative politics and sociology, Kyoto Sangyo Univ., Japan.

Oct. 11: The Hon. Risphpal Singh, consul, cultural affairs, consulate of India in San Francisco.

Mr. Tilden Santiago, editor, "Diario do Comercio" newspaper, Belo Horizonte, Brazil.

For further information, please call 497-1984, International Visitors, Maria Bun.

CAMPUS REPORT

Volume XV, Number 3 | A publication for Stanford University faculty & staff | October 6, 1982

Mediating talks resume at 10 a.m. Thursday

Federal mediators Tuesday summoned both sides to a mediation session set for Thursday, Oct. 7, as the strike by United Stanford Workers against the University neared the end of its fourth week.

Heavy picketing Friday and Monday at SLAC and the new student housing project resulted in 16 arrests, bringing the total to 24 since the strike began Sept. 10.

The stepped-up picketing Friday followed an off-the-record session last Thursday between the chief negotiators for each side and two federal mediators. The mediation was suspended after three hours when neither side made any concessions.

Following the San Francisco meeting, USW released to the press confidential University documents about bargaining unit salaries. *(See text, page 9.)*

Federal mediator Clarence Washington said Tuesday "we're getting both parties back together." The session,

Stanford opposes ending mandatory retirement at 70

Stanford University strongly opposes ending mandatory retirement for tenured faculty at age 70, President Donald Kennedy and Provost Albert Hastorf told the Faculty Senate Thursday, Sept. 30.

Legislation ending mandatory retirement has attracted broad Congressional support and has been endorsed by President Reagan.

Even so, Hastorf said, it is "doubtful" Congress will act on the proposal this year. But it is "quite likely" to pass in the future, possibly with a seven or eight-year "temporary pause" or moratorium for institutions will tenure, Kennedy said.

"We will continue to use age 70 as the retirement age, unless required by law to do otherwise," Kennedy said. This will apply to those reaching 70 in any transition period. "Our capacity to treat people in (such a) 'window' is exhausted," he warned.

When the mandatory retirement age was recently raised from 65 to 70, the University tried to ease the financial burden of those caught in the transition period.

Many of those reaching mandatory retirement age are recalled to active duty, when this accords with the needs of their departments. Presumably, this practice will continue.

In an Aug. 13 letter to Senator Donald Nickles, Kennedy said that "uncapping" retirement for tenured faculty would have "an unusual and profound" effect on the University, especially younger faculty,

Kennedy on science, liberal arts

During the past century, scientific discovery has deeply influenced humanistic views of freedom, rationality and equality, Stanford President Donald Kennedy said Monday, Oct. 4, in remarks prepared for the University of Oregon's fall convocation in Eugene.

"Serious pursuit of the implications of scientific discovery for liberal learning" should become a "crucial educational objective" of institutions like Stanford and Oregon, which are strong in science but committed to the full range of cultural exploration, he suggested.

"Uprooting the humanities from science robs us of a critical understanding—that they are the products of a co-evolutionary process, just as surely as the brain and culture are," he said. "That unity is the brightest and most exciting academic vision we could have."

A biologist, Kennedy said that "nowhere can the case for interpretation between the sciences and humanities be made more compelling than in the area of evolutionary thought. Yet ironically, it was the Darwinian Revolution that probably created the 'two cultures' problem in the first place."

(See text, page 10.)

Ombudsperson...

Goheen says Taiwanese spy on students

There is a nation-wide system of Taiwanese students spying on each other for the Taiwan government, Prof. John Goheen declares in the annual report of the Stanford Ombudsperson for 1981-82.

"The objective is to suppress any criticism of the Taiwan regime or dissent from its totalitarian principles," he adds.

This "strange and disconcerting situation" came to light in the aftermath of a news story published by *The Stanford Independent*, a student newspaper, last fall.

"The documentation is extensive, including calls in the U.S. Congress for an investigation of Taiwanese 'intelligence surveillance' in this country," Goheen says.

"It is only fair to add that the active Taiwanese informants appear to be a limited group, involving some but not all Taiwanese students. Furthermore, some Taiwanese nationals other than students have been involved in these activities."

Stanford has about 134 Taiwanese students. In its Oct. 21, 1981 issue an article based on extensive interviews, *The Independent* reported that 11 professionals in the Stanford area had written a confidential letter to Congressman Steven Solarz, chairman of the House Subcommittee on Asian and Pacific Affairs, claiming that they were "under constant surveillance and harrassment by Kuomintang agents. Many of us live in fear of our safety and the safety of our family members."

The informality of these checks makes it difficult for U.S. authorities to detect and pursue informants through normal criminal procedures, *The Independent* noted. National attention was focused on the problem following the mysterious death of Carnegie Mellon University Prof. Chen Wen-chen in Taiwan last fall.

In 1978 an independent investigator appointed by the University of Hawaii concluded that "There is sufficient evidence, even though not of the type

People

Presidents **Donald Kennedy** of Stanford, Charles Young of UCLA and James H. Zumberge of the University of Southern California are among 26 university presidents serving on a new American Council on Education committee seeking to correct abuses in intercollegiate athletics.

Headed by President Derek Bok of Harvard, the new group will hold its first meeting Sept. 26.

Ace President Jack W. Peltason noted that corrective measures were needed because "recent charges involving illegal payments to student athletes, transcript manipulations, and other alleged abuses are injuring the reputations of some of the nation's finest institutions."

Proposals from the Committee may be considered at the National Collegiate Athletic Association Meeting in January, 1983.

Myron Scholes

Myron S. Scholes, 41, University of Chicago professor of finance, has accepted a joint appointment from the Stanford Graduate School of Business and the Stanford Law School, effective Jan. 1.

Former director of the Center for Research in Security Prices at Chicago, Scholes has been a professor there since 1976 and was named to the Edward Eagle Brown professorship last year.

Most of his research so far has concentrated on the developing and testing of finance theory. He has recently started work on the frontier linking finance and law. Law scholars predict his work will have great potential for law and public policy.

His knowledge of the tax code has been described as legendary. He was the prime mover in developing the finance teaching program at Massachusetts Institute of Technology, which after nine years is still regarded as one of the most demanding programs in the Sloan School of Management.

Born July 1, 1941 in Timmins, Ontario, Scholes received his bachelor's degree at McMaster University in 1959. He obtained his MBA at Chicago in 1964 and his doctorate there in 1969.

His major publications include "Dividends and Taxes: Some Empirical Results," coauthored with Merton Miller in the *Journal of Political Economy*; "A Simulation of the Returns and Risk of Alternative Put Option Investment Strategies," coauthored with Robert Merton and Mathew Gladstein in the *Journal of Business*; and "Dividends and Taxes," coauthored with Miller in the *Journal of Financial Economics*.

John Moore

President Reagan announced his intention last month to nominate **John H. Moore**, associate director of the Hoover Institution at Stanford, to a six-year term on the National Science Board.

Three others were nominated, subject to Senate confirmation: Charles E. Hess, dean of the College of Agriculture and Environmental Sciences at UC-Davis; Norman C. Rasmussen, MIT professor of nuclear engineering; and Roland W. Schmitt, vice-president for corporate research and development at General Electric, Schenectady, N.Y.

Moore has been associate director of the Hoover Institution since August 1981.

Formerly professor of economics and associate director of the Law and Economics Center at Emory University, Moore was a national fellow at the Hoover Institution in 1975-76. Moore taught economics at the University of Virginia from 1966 to 1977.

Moore received B.S.E. and M.B.A. degrees from the University of Michigan and a Ph.D. in Economics from the University of Virginia. He is the author of *Growth and Self-Management: Yugoslavia and Industrialization, 1952-1975* (Hoover Press, 1980) and numerous articles on economic theory and comparative economic systems.

Bike lock stolen from...

Stanford Police Chief Marv Herrington, seen disembarking from his bicycle in front of the President's Office Monday, was asked why he was not locking his bike.

"Can't," he replied. "Someone took my lock."

Lewis Spitz

Prof. Lewis W. Spitz, of the History Department lectured at Heidelberg University on "Luther in America" at an international symposium on "Luther in Modern Times," held September 8-11.

The symposium, sponsored by the German Society for Reformation History, featured lectures by scholars from seven countries.

Profs. Walter Mischel and **Amos Tversky** of the Stanford Psychology Department have received distinguished scientific contribution awards from the American Psychological Association.

The awards, consisting of $1,000 each, cited Mischel "for outstanding contributions to personality theory and assessment" and Tversky for "providing innovative and incisive ways of studying and thinking about judgment and decision making." Tversky's award was shared with Prof. Daniel Kahneman of the University of British Columbia.

Mischel has been a Stanford faculty member since 1972. Born in Vienna in 1930, he holds degrees from New York University (B.A., psychology 1951), City College of New York (M.A., psychology, 1953) and Ohio State (Ph.D., 1956). His 1968 book on *Personality and Assessment* is considered a classic.

Tversky has taught at Stanford since 1978. He earned his B.A. in psychology at Hebrew University in 1959 and his Ph.D. at the University of Michigan in 1965. He and Kahneman have jointly authored 19 publications since 1971.

Both Mischel and Tversky have been fellows at the Center for Advanced Study in the Behavioral Sciences at Stanford, an independent, nonprofit organization overlooking Lake Lagunita.

Charles Lyons

Prof. Charles R. Lyons, chairman of the Drama Department at Stanford University, has attended a gathering at the Beverly Wilshire Hotel in Los Angeles hosted by Armand Hammer to celebrate the formation of The Shakespeare Globe Centre, North America Inc.

This organization, chaired by Hammer, will raise funds for the building of the replica of Shakespeare's playhouse on its original Bankside location. The building that will house the Old Globe will be a complex facility incorporating the reconstructed playhouse, an indoor theater built to the design of Renaissance architect Inigo Jones, a museum, and a cinema theater.

Support groups include two American organizations, the Shakespeare Globe Centre, North American Inc., and The Academic Advisory Council North America.

Lyons was present as a member of the Academic Advisory Council and also as a representative of his department, which is one of the 11 charter contributors to the Shakespeare Estate Royalty Fund.

Producing theater companies will contribute a percentage of their income from productions of Shakespeare. Half of the voluntary payments will go into the actual building fund, and half into a fund available to the contributing group to help defray the administrative costs when members of their own theater or university use the facility for research, study, or performance.

Gerald Gillespie

Professor Gerald Gillespie was reelected secretary general of the International Comparative Literature Association at its tenth triennial world congress held in New York, August 22-29.

Currently, 15 national and regional societies, including the American Comparative Literature Association, are affiliated with ICLA. The international group comprises some 2500 scholars working in 60 countries.

Gillespie joined the German Studies and Comparative Literature programs at Stanford in 1974.

Edward T. Fishwick, a library specialist in the Reference Department, has been admitted as one of six 1982 CLR Fellows to the University of Michigan School of Library Science's special program for the professional education of academic librarians.

The fellowships, financed primarily by a grant from the Council on Library Resources, cover all tuition and fees and provide each student with a stipend of $7,200.

Jon Jang, striking Campus Mail deliverer, will be guest artist with The United Front at the Asian American Jazz Festival, to be held 7:30-11 p.m. Saturday and Sunday, Oct. 8-9, at Lone Mountain Auditorium on the University of San Francisco campus.

Medical postdoctoral fellow sought

Postdoctoral fellowship available immediately in retinal physiology or electrophysiology located at the Palo Alto Veterans Administration Medical Center and the Division of Ophthalmology, Stanford University Medical Center.

Please contact Dr. Michael Marmor at VAH 497-6296.

Tjeerd Van Andel

Severe droughts, floods and some very erratic weather lie ahead: Van Andel

BY DONALD STOKES

Today's children will live to experience an environment less favorable than now.

The earth's temperatures will rise significantly; the weather patterns will alternate more erratically than now; the oceans will rise.

In California, the danger of droughts will be a constant concern.

A foretaste of what is to come occurred during the severe droughts in California in 1975 and 1976. If there had been a third year of drought, tens of thousands of people would have had to be evacuated from the larger cities of California.

These disturbing thoughts come from Tjeerd Van Andel, professor of geology at Stanford, who has gained fame as an oceanographer, human biologist and geophysicist.

For many years Van Andel researched the geophysical changes of the past. During this work he revealed historic links between ancient Greece and its history as affected by climatic conditions. Now he is studying what is happening to the world's climate today, and what is likely to happen in the years ahead.

"It is possible that the late Bronze Age civilization in Greece was wiped out because the people were living at the limits of their environment, and the balance was tipped when they had several years of bad harvests in succession," he said.

"Similarly, several civilizations in South America, which had reached remarkable heights of civilization may have died out because of climatic changes.

"The worrying aspect is that it takes only a small margin of change to bring drastic changes in living conditions. Just a few degrees difference in temperature can do it.

"We are beginning to realize the reasons for the collapse of various civilizations in the past. But we are far less sure in trying to map the future.

"One thing is certain. The way we are burning fossil fuels means that we are steadily building up the 'greenhouse effect' in the upper atmosphere, so that there is a steadily greater accumulation of carbon dioxide floating up there which will have the effect of raising the earth's temperature. This has been going on ever since the Industrial Revolution began 200 years ago."

Asked whether the heat-building effect was increasing at an exponential rate, Van Andel replied, "No, because the oceans are absorbing a significant amount of the carbon dioxide we produce.

"At some point the oceans will reach their threshold of receptivity to all this carbon dioxide and they will not be able to absorb any more. Then all the carbon dioxide will be accommodated in the atmosphere.

"Nobody can forecast what will happen then, but it seems likely that the climate change will be very rapid."

Within 50 years, Van Andel believes, drastic changes will take place in the earth's atmosphere as a result of the "greenhouse effect." The arguments of scientists today range largely over how drastic the changes will be.

"The current phase of climate has really only been going on for about 15 years," he said. "Up till then it had been the preserve of a few climatologists and the odd geologist who was interested in climate history.

"When you realize that it takes only a few degrees difference in the earth's temperature to make dramatic changes, the 'greenhouse effect' has to be studied ever more seriously. There was a difference of only about 10 degrees Centigrade in the mean temperature of the earth between the Ice Ages and the semi-tropical periods.

"Many scientists believe that the mean temperatures of the earth will increase up to two or three degrees Centigrade in the next century."

Asked what was likely to happen in California, Van Andel said: "Probably it will become more dry. That would be symmetrical with the previous period of the Ice Age, when it was very wet.

"This will mean more and greater periods of drought. What we have seen in California during the last seven years—severe droughts alternating with bad flood conditions—is likely to continue in the next three or four decades."

What can be done to cope with these changing conditions?

"Water policy in California has been based on averaging the rainfall of many decades," he replied. "During most of that time there were few strong variations. That policy is falsely based. Rainfall patterns are going to be sharply different in the future, as they were in the late 19th century.

"What we are likely to see are several years of little rainfall interspersed with years of having heavy rainfall. We came very close to a crisis during the California drought which lasted during 1975 and 1976.

"If the drought had continued into 1977 there is little doubt that tens of thousands of people would have had to be evacuated from the major cities of California. Why? Because there would not have been sufficient throughput of water to remove the sewage.

If there had been a third year of drought (in 1977), tens of thousands of people would have had to be evacuated from the larger cities of California.

—Tjeerd Van Andel

California has no solid plans to deal with the highly probable state of emergency that will arise when we have more sustained droughts.

"My student team that researched the situation found that all the authorities had envisaged was to have tank-trucks to dole out water to people on street corners. They did not realize that there are not enough water-tank trucks west of the Mississippi to do the job.

"The fact is, politicians are not immediately interested in matters that don't worry the voters. Efforts to draw attention to the situation invariably get a ho-hum reception."

Van Andel was asked what the probable effect would be when the world ran out of oil and coal, and people had to use less polluting sources of energy. Would that halt the "greenhouse effect" and perhaps allow it to slowly disperse?

"No, if we continue to burn all the oil that we can get our hands on, the probability is that we shall have doubled the 'greenhouse effect' by about the year 2030.

"By that time, there will be nothing that can be done. The bad effects will be with us for several centuries. That is because the carbon dioxide divides into two receptors, the larger being the oceans and the rest goes into the atmosphere.

"The two are in equilibrium. The reason why we have not had much 'greenhouse effect' so far is that the oceans have taken in a very large share of the carbon dioxide. Eventually the oceans will take all they can hold, and after that *all* the carbon dioxide will pour into the atmosphere.

"Can the process be reversed? No. The situation will probably begin to get really bad about the year 2050."

Van Andel agreed that this meant today's children would live to see drastic changes in the earth's climate. It would be significantly warmer in many areas, particularly in the interior of large land masses, the upper atmosphere would be saturated with carbon dioxide, and the oceans would be rendered more acid.

"The problem in human terms is largely a political one. Now that the oceans are absorbing the carbon dioxide it is hard to convince the authorities that anything needs to be done. When the effects

continued on next page

Van Andel...

continued from page 3

become obvious it will be too late to do anything.

"Scientists argue about the probable extent of the changes but not about their reality. Most of us agree that the mean temperature of the earth will rise by two or three degrees, and up to eight degrees in some areas."

How would this affect living conditions?

"A main effect would be on precipitation, which should increase on the average. We cannot figure out at this stage the full effects of the distribution pattern.

"All we can say is that it will rain in many places where it rarely does today, but rain might decrease in many places where it is needed.

"We may have lots of rain where we can't use it, and not have enough where we now count on it.

"Probably those areas close to the oceans will get much more rain than they do now if the prevailing winds come from the sea."

Van Andel was asked whether the cutting down of trees on a vast scale, as is now happening in the Amazon basis, would have catastrophic effects on the world's climate.

"The effects will probably be mostly local," he replied. "Roughly half of the jungle areas have been cut down in modern times, and by the end of the century they will be further reduced by a factor of two. That will certainly have severe effects on the weather of the respective regions as large areas of forest usually attract rain. Probably it will mean that those lands will be much drier than they are now, and less usable agriculturally.

The long-term result of the 'greenhouse effect' will probably be that land temperatures will increase by a mean of two or three degrees. That may not sound like much, but such a change has always meant tremendous changes in the world's living conditions.

"Probably the changes will be greater in the polar regions than at the Equator. Overall it will mean more ice melt and higher sea levels."

Van Andel said that there were certain cycles in nature that affect climate, but the reason for the cycles is not known. One example is known as the 'Little Ice Age,' which lasted from about 1450 to 1850, when there were frequent severe winters, much colder and wetter than the present generations have experienced.

"Today we are entering a warmer period, and again we do not know the exact reason for it.

"During the last glacial period the oceans fell by about 100 meters. Today the waters are rising, on the average of a few centimeters every century.

"This rise of the oceans is of great concern to humanity, for a considerable number of people live close to sea-level. There are tens of millions in the Ganges delta, much of the Netherlands is below sea-level, and so on.

"Much of the valuable land in the world—the industrial areas, the harbors, and large cities, are less than 20 meters above sea-level.

"It is probable that if the 'greenhouse effect' continues the ice at the poles may start melting, and so makes the oceans rise possibly by six to ten meters."

Van Andel was asked which of the two main influences on climate was the stronger—that of Nature or man? Were the successive Ice Ages due to natural causes more powerful than mankind's pollution of the atmosphere and the consequent great climatic changes?

"We don't have sufficient data to answer that," he replied. "We don't even understand the natural causes of change. What is generally believed is that there are certain changes in the orbit of the earth round the sun which cause the Ice Ages. It is a very complicated model which is still being worked out, and it does not explain everything. In particular, it does not explain why the alternation between ice ages and warmer periods has occurred only occasionally during the earth's history."

Van Andel agreed that a combination of the two major factors—the 'greenhouse effect' and the cycle of warmer weather following the 'Little Ice Age' pointed to significantly warmer weather in the century ahead.

"However, there is considerable evidence that climate is resistant to change, and resists for a long time. Then comes a time when climate can resist no longer, it flips over and the change to the other side is comparatively rapid. Flip-flops between glacial periods and warmer periods have often been rapid, sometimes less than a few thousand years.

"With smaller climate fluctuations, like the Ice Ages, it may only take decades.

"It does not take much of a change in mean temperature to change from a little Ice Age to a warm one. Probably less than 2-3 degrees Centigrade.

"It would take a drop of only two degrees Centigrade in mean temperature in the northern hemisphere to change many wheat-exporting nations into wheat-importing ones—all except for the United States, which would be able to export a little, and Canada, which would remain self-sufficient.

"Alternatively, a rise of two degrees would have equally great results, but because the result would affect mainly the precipitation all that one can say is that we would be unpleasantly surprised. Not to mention the rising water over the lowlands, of course.

"You must keep in mind that a wide range of factors influences weather. Usually the picture shows considerable fluctuations from year to year. In the last seven years in California we have had two years of severe drought and one winter of record-breaking rains."

Van Andel is best known for his work in an entirely different area of geophysics. Together with scientists from other institutions he has done pioneer work in exploring by submarine the strange phenomena on the ocean floor.

He has found areas where volcanic eruptions on the sea-bed, and the emergence of hot springs, have led to the existence of sea creatures never before imagined.

"I like to change direction every few years," he said. "This new area of climate change is full of interest and challenge."

Van Andel is an extremely popular teacher, and his course evaluations by students are consistently at the highest levels.

"Great teamwork is possible in the study of climate change and we handle it in seminar form. The students can take a personal part in the research, and at the same time learn how to gather data on social and economic issues.

"In particular, they gain some skill in presenting their views and data to a skeptical public audience."

Van Andel was born in the Netherlands and received his education largely at the University of Gronigen, where he obtained his doctorate in 1950. He did graduate work at universities in Holland, Switzerland and Paris.

He came to the Scripps Institutions of Oceanography in 1957. Next he became head of marine geology and geochemistry at Oregon State University. After a visiting professorship at Stanford 1974/75, he became professor of oceanography, then of geophysics, at Stanford in 1976.

Of all the many honors and awards he has received, one that means much to him is his election to membership in the Royal Netherlands Academy of Sciences.

Flying carpets may be just over horizon, Physicist Little tells freshmen

Flying carpets could be just over our horizon, said William Little, professor of physics at Stanford, in a talk to incoming freshmen Sept. 24.

"There will be engines that can develop great amounts of energy but occupy only a very small space, trains that will float on a magnetic field and travel at over 300 m.p.h.

William Little

"All these can be achieved right now" he said, and have been in model form. But they are based on a form of super-conductivity that requires the creation of extremely low temperatures. This is not practical or large-scale use. Now we believe that the need for low temperatures can be dispensed with.

"As a result of work going on in Denmark and elsewhere, it is now probable that materials can be created that will allow the generation of high energy without the need for low temperatures. In fact it may be possible to do it at normal temperatures."

Little, a double Ph.D., has been experimenting with low temperature for 20 years. Fifteen years ago he suggested that it should be possible to create super-conductivity at ordinary temperatures, but his ideas were not taken up.

Working with physicists in various parts of the world he has experimented with compound polymers and certain metallic compounds. Little compared the difficulties of achieving super-energy in ordinary temperatures with trying to design a brick which has the ability to self-assemble with others to build a house.

"One curious effect, when these materials are finally created, will be that we shall be able to levitate things—people, structures, carpets, said Little.

Little gave a practical demonstration of how flying carpets are already possible, using superconductivity. He produced a model carpet on which sat a manikin. He passed the carpet through one magnetic field and laid it on a section of the floor which had been linked to a low-temperature source.

When the current was turned on the carpet, with the manikin on it, rose into the air and stayed there. Little passed a piece of paper under the carpet to prove that nothing was holding it up except the opposing fields of magnetism.

In a similar demonstration of the repulsion of magnetic fields, Little placed circular rings of copper and aluminum on a device which had been super-cooled by liquid nitrogen, then attached to electro-magnets. When the current was turned on the rings were violently ejected into the air.

Little explained that if a metal was cooled to the temperature of liquid helium, (an extremely low temperature) then the metal acquired a super-conductive state, a billion billion times that of the normal state.

Using this principle, extremely powerful magnets could be made. Not only that, but they could be made self-sustaining, and maintain their magnetic fields without any power source, so long as they were kept at low temperatures.

"It is possible to make highly efficient electric motors using these principles. Some are being built (for the U.S. Navy) that develop 3,000 h.p. This is only a start," said Little.

"Another use of superconductivity is the construction of huge generators which have 10 times the capacity of the most powerful one it is possible to build today."

"The most exciting developments however, rest with the creation of materials that superconduct electricity at normal temperatures. Considerable progress is being made in achieving this."

In an interview, Little said he believed that the search for super-conductors was an art form rather than a scientific search. "Those researchers in the U.S. and the Soviet Union who have been most successful," he said, "have done so through empirical extrapolation."

He touched on this theme in his talk to the freshmen. He urged them not to be confined by the apparent limits of their field, but to think broadly along independent lines.

EDGE: Helping engineers understand what they have wrought

Interdisciplinary course widens view

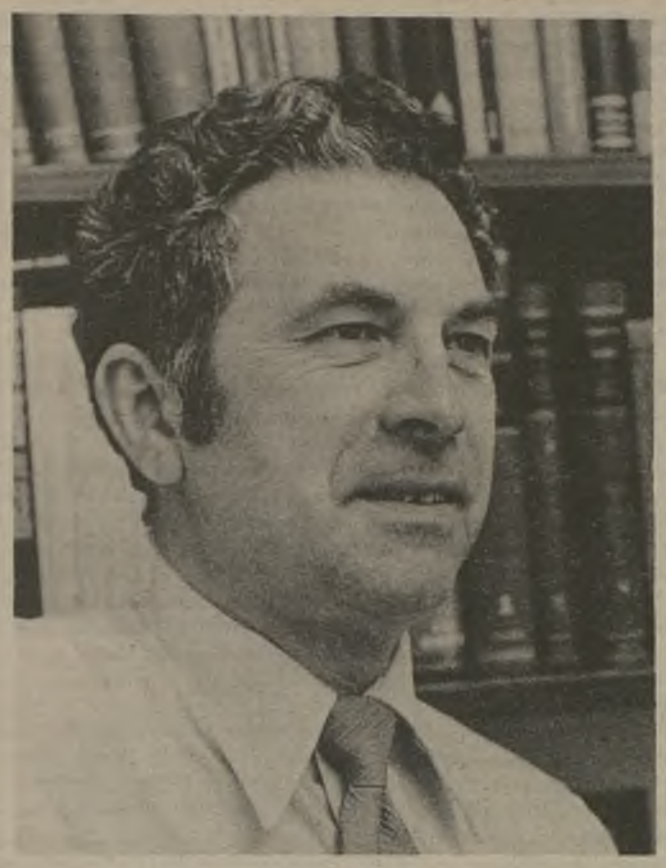
If an engineer helps dam a river, will that dam produce cheap energy and jobs, or will it eliminate more jobs than it produces, ruin agriculture downstream and disrupt the local ecological balance?

Prof. Malcolm McWhorter of the Stanford Department of Electrical Engineering believes that engineers in this situation, or ones like it, should be sensitive to the ethical and social consequences of their work. To help instill this awareness, more than 10 years ago he helped found a year-long course which has come to be called EDGE: the Ethics of Development in Global Environment.

In the late 1960s, McWhorter and some colleagues became concerned about engineers' ignorance of the ethical dimension of their work during a visit by Professor P.A. Ligomenides of the University of Maryland. Foreign engineering graduate students from developing nations were coming to industrialized nations for their education. Many of them were deciding to remain in more comfortable, stimulating positions here rather than returning home to help alleviate the problems of their home countries with their training.

"We wondered what you could do to. . .encourage the engineers to return home, and. . .what could you do to increase the relevance of their educations to their home countries," says McWhorter.

As a result of these discussions, McWhorter and his colleagues brought together a group of foreign students and asked them what they found dissatisfying about their education. McWhorter's group also sent questionnaires to engineering alumni in foreign countries asking them, among other things, what they were doing now and what they would have done differently in their education.



Broader studies

"Almost universally," relates McWhorter, "they said that they wished they had been broader in their studies. . . . What they were doing then, while perhaps technologically related, often had other overtones. Possibly, they were the head of a department in a university, and no one had ever taught them anything about education, for example, or they were in government and planning and no one had talked to them about planning and the interrelations of different disciplines. . . ."

It seemed hopeless to try to teach a course directly relevant to foreign students' home countries since what was relevant depended on the country, and this was not Stanford's prime mission, he adds.

"It seemed to be more desirable to try and make some kind of course that would bridge the gap between what they were getting, which is a very good technological education, and some other aspects of society."

At the same time, Ken Cooper, who had been director of the Bechtel International Center, left his post to take a journey around the world. Cooper, who is an engineer with a Ph.D. in anthropology, interviewed Stanford alumni around the world. By the time he had returned, he decided that Stanford needed a course concerned with ecology, world resources and the "preservation of the planet." Since different nations have different attitudes toward environmental problems, his course included a study of the political systems of the world.

The University... is very poor at answering the questions 'should you?' and 'who benefits?' from a more ethical point of view. —Malcolm McWhorter

Around 1973, McWhorter and Cooper decided to combine the courses since they were covering similar issues, and since ecological problems are closely related to technological ones. This is how EDGE was born.

The emphasis of the course has changed over the years. It originally stressed problems of natural resources and the environment. In recent years it has dealt with technology transfer and the economies of developing nations.

Funding difficulties have put its future in some doubt. The course has received temporary funding since its inception from the Office of the Dean of Graduate Studies, in addition to departmental support. This funding is now at an end. Also, Cooper, one of the cofounders and driving forces behind EDGE has left the University. McWhorter has stated that he will again give the course this year.

"I think that EDGE will pull through."

'How does the world look?'

Each quarter of the three-quarter sequence stresses a different theme. For example, last year, McWhorter and his colleagues tackled the question "how does the world look now?" during the first quarter. They looked at the world's resources and the effect of international sociopolitical processes on resource distribution.

During the second quarter, the question was "what are the different political systems in the world, and how do they manage their own problems of resources and development?

"The studies got into different political systems, ranging from Brazil which is a freewheeling capitalist society, to Sweden, which is a controlled capitalist and socialist country, to mainland China, which is communist."

During spring quarter, students discussed the question "what can an individual do?" drawing examples ranging from East Palo Alto to Mexico, with speakers having experience working in several developing countries.

EDGE is taught by a group of professors and students, most of whom are affiliated with Stanford, and a few guest speakers from Bay Area institutions and universities. The Departments of Anthropology and Political Science, and the Schools of Education and Engineering have all contributed support in the form of one or more teaching assistants.

Although EDGE is an interdisciplinary course, it is based within the departments that sponsor it. McWhorter's philosophy is that EDGE should stimulate the student to relate the different disciplines: "the place EDGE fills in is where. . .one discipline and another need to come together. For example, political scientists talk about how governments come and go, and yet technology and social institutions and so on have a great effect on this as well."

He also feels that EDGE should be a place where students and teachers of many different backgrounds meet to exchange their views on world problems. EDGE's other half, the in-depth, issue-oriented workshops, has given them this opportunity.

"The way we've organized the class in these last years is that for one unit, you go and listen to the lectures. If you want to take it in a deeper sense. . .you are asked to take a workshop. The workshops by and large are voluntarily run by different people, sometimes by students."

Topics of the workshops in recent years have ranged from the international problems of petroleum to the effect of industrialized nations on food supplies in developing countries.

McWhorter believes that the workshops are one of the few places in the University where students and teachers from different disciplines can exchange views on global problems and develop an ethical perspective.

"The University is very good at teaching students whether or not you can do something and how to do it; for example, how to build a new building or a new dam, where you can build it, etc., but it's very poor at answering the questions 'should you?' and 'who benefits' from a more ethical point of view.

"It's quite good at deciding issues from an economic point of view, but it doesn't usually bring in the issue of if it's an economic improvement, for whom is it an improvement?"

The course's teachers don't try to package neat answers to the ethical dilemmas of their students, but to open their conscience a bit. For example, "when you decide for economies of scale. . .that you will modernize farming in a developing country, what then happens to all those people who now have no job and who now must move to the city? The problem of Mexico City in growth is an outstanding example."

Questions, no answers

Students have complained that "you give us lots of problems but very few solutions." "Unfortunately," adds McWhorter, "I fear that's the way the world is.

"There is a certain naivete which is surprising. For example, the topic of multinationals doing things for their own good and not for the community where they're operating is taken almost as an inevitable fact by the foreign students, and on the other hand, I've seen freshmen and sophomores. . .who couldn't believe it; not that they wouldn't believe it, it's just that they were startled to find that someone wouldn't do something that would be in the best interests of the (host nation)."

McWhorter has had some experience teaching abroad, but his main motivation for spending time on EDGE is a feeling that the people of the world need to help each other to get along.

McWhorter did his undergraduate work at Oregon State University and finished his M.S. and Ph.D. in electrical engineering at Stanford. He has been a visiting professor at the Korean Advanced Institute for Science for a quarter each in 1974 and 1976. He also spent last summer at the Institute for Development Studies in Sussex, England.

"I have a personal feeling that I and the University are presumed in some sense to benefit mankind in some way. It's nice to think that you're doing something useful.

The longer view

"Part of this came about by asking, were we really doing something useful? If you ask if we make useful students for industry. . .that we can answer affirmatively very easily. On the other hand, if you take a longer—range view, which industries typically don't, and which governments typically don't because they're transient, you could ask if just preparing a good technician is sufficient.

"My. . .feeling is that it's not, and that in fact, even for the good of industry, the person should have a wider view, so that though he may have a job of limited use to society at least he has a perspective which tells him what he should be doing.

"I personally don't feel that there can be a world of extreme inequity between a half of the world and another half of the world. It's getting to be too close together."

—Allen Chen

Supervisors learn fundamentals, share experiences

Sometimes a Stanford office or lab staff functions like the '49ers on their way to the Superbowl. Everyone works well together, supports each other, and shares satisfaction for a job well done.

Then there are the times when an entire working group is disrupted by poor performance, misunderstandings, or personality conflicts.

Most of the time a staff group is somewhere between the two extremes, but wherever it is, the supervisor has most of the responsibility for its daily functioning.

The best supervisors may be born, not made, but Employees Relations is doing its best to tip the scales in Stanford's favor.

More than 150 Stanford staff members have taken the course in Fundamentals of Supervision, now in its third year. All of those interviewed by *Campus Report* were pleased, citing both short- and long-term benefits in the way they handled their jobs.

"The course on supervising gets people to focus on that particular relationship for a while," said a man from Encina Hall. He was in the class primarily to learn how to handle "one of the more difficult parts of being a supervisor—talking to an employee about his performance."

A woman from Inner Quad commented: "What impressed me was the approach—always value the employee's self-esteem. If you keep that in mind, you get good results."

"One of my employees said that after I took the course I was a lot easier to get along with," reported an administrative assistant in an academic department.

"I took the course to get a more structured approach to being in charge," she continued. "You don't always learn the best, the most efficient, or the most appropriate way of doing things from your own supervisor. My supervisors are faculty members—they don't want to supervise."

Why the course?

Director of Employee Relations Felix Barthelemy recalls the main reasons for initiating the course in 1979.

"We frequently had requests from supervisors themselves for training," he says. "They had ended up in supervisory positions without any training, or they wanted to test their skills.

"Some managers suggested it for their supervisors. It was their perception that some supervisors did not have skills as strong as they should be.

"And we at Employee Relations could see that it was needed from our own interactions with employees. A majority of our cases, when an employee initiates the interview, has to do with some interaction with a supervisor that hasn't gone well."

Staff Development Coordinator Judy Moss adapted the Zenger-Miller program for supervisor training for the University, and a pilot group took the course in November and December, 1979.

Since then it has evolved considerably, guided by feedback from each class. The goal is to train supervisors who are responsive to demands from their own supervisors for job performance and sensitive to the needs of employees for job satisfaction.

Now two groups of 10-12 meet each quarter for the first course, which concentrates on the active aspects of supervision: knowing and understanding a job and teaching it, setting standards, communicating about performance, and listening to and giving recognition to employees.

The second course centers on problem-solving—reaction and response to things that need to be changed, such as poor performance, problem behavior, or complaints.

After that, there are one-session classes on single subjects: change, delegation, listening, conflict management, etc.

Opportunity to share

One of the most valuable parts of taking the courses, for many, is the opportunity to share problems and solutions with supervisors from other parts of the University.

"We found that most departments have very similar problems," said a member of the pilot class.

Moss agrees. "People enjoy discussing issues together," she says. They are experts to each other. In the course, principles are talked about by people from their own experience. There are some wonderful trade-offs— we've had people who've been supervisors up to 20 years."

At the beginning of each new class, members are asked what their greatest supervisory challenges are. Later, one meeting is dedicated entirely to whatever is the most current issue for the group as a whole.

In the newest evolution of the course, prospective members will state their objectives when they apply. In time, Moss hopes, the result will be a supervisory system tailored specifically to Stanford's needs.

The course can be adapted to the needs of a particular school or department, too. The Graduate School of Business last spring graduated the first class in a course that included participants from every management level.

Course will evolve

Personnel Director Rob Parker sees Fundamentals of Supervision as changing to respond to whatever goes on at Stanford.

"There will always be some values and issues that endure over time and don't change much from year to year. But there are always new ideas and initiatives here—it would be really critical that supervisors understand, so that they can reinforce them. We need to make sure that the programs are updated to reflect that."

He also hopes that the courses will be able to tap a vital resource that already exists on campus—those supervisors who intuitively know what to do to maintain a happy working atmosphere.

The fall quarter courses in Fundamentals of Supervision have already begun. For information about the winter quarter courses, call Bea Tracy, ext. 7-0657. Other staff development courses were listed in the Sept. 8 issue of *Campus Report*.

—Pat Black

Below are comments on supervising at Stanford from some of the graduates of the Elements of Supervision course.

It's very interesting seeing different people in the same job bringing their different qualities and strengths and style to the job. No two people do a job the same way.

The most careful interview won't tell you how a person will perform on the job.

A key thing about supervising is choosing the right people to do the work. I have trouble working with slow people—I start feeling incompetent, nothing works. I really appreciate a good employee.

The staff is appreciated; their work is important.

Being a supervisor is a little like being a housemother. I've seen people positively blossom with constructive criticism.

I like input from employees. When we meet I have my say, then I open it up to them. I listen to what they say.

Poor supervising can go unnoticed for a long time. At Stanford, many people continue to do their work in spite of poor supervision. They are loyal, dedicated employees who do their work despite negative office situations.

Good supervising does not get rewards—the main sign of it is no problems, and it's problems and problem-solving that get the attention.

I don't expect employees to love me. What I want is respect for my position, and I will respect them, too.

Supervision is a challenge. Every day something new arises. You never know what's going to happen.

The History Department's Barbara Wawrzynski talks at the first meeting of H & S department administrators.

H&S department administrators meet

A new group of Humanities and Sciences department administrators had its first formal meeting Thursday, Sept. 23 in History Corner.

Those at the meeting included department secretaries, administrative assistants, and administrative service managers from about 30 departments and programs.

"A department administrator has no one to talk to," explained Barbara Wawrzynski, administrative assistant for the History Department. "We can't discuss problems with our staff or with the chairman."

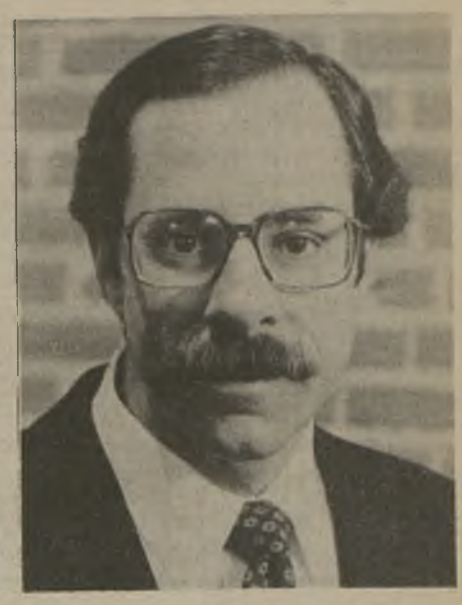
The situation changed when administrators began to meet each other at staff development workshops and exchange problems and solutions. They started to spend lunch hours together from time to time.

Now all the H&S administrators have been invited to participate in the planned monthly meetings.

The biggest item on their agenda is communication—ideas, solutions, concerns, information, and mutual support. They'll share good travel agents, caterers, and candidates for clerical positions.

The administrators are thoughtful, articulate people, some of whom have worked in Stanford's academic departments for 20-30 years. For information about the group or to suggest topics for discussion, call Barbara Wawrzynski, ext. 7-2651, or Arlee Ellis, political science, ext. 7-1806.

Effective supervision can be key to employee morale



The staff supervisor—as motivating force, communicator, and instructor—plays a significant role in the lives of Stanford employees and in the University's success in meeting its goals.

Skillful supervision is a valuable contribution at Stanford; it is a role that deserves to be taken seriously.

—Donald Kennedy

Felix Barthelemy

Rob Parker

'I've been fairly constant in my belief that one of the most critical ingredients for successful employee experience at Stanford is the quality of supervision," says Personnel Director Rob Parker.

No Stanford staff member would quarrel with that statement; most could contribute a few stories to illustrate it. One woman who suffered under an insensitive supervisor said after leaving the job, "It was the most miserable five years of my life."

The supervisor has many possible roles: teacher, mentor, worker, guide, middleman, scapegoat, motivator, communicator. . . . How he or she fills these roles has much to do with the success of an employee's working life as well as with how the staff carries out the work of the University.

Yet until about three years ago, there was no regular training available on campus for supervisors who did not have the skills to carry out their duties effectively.

A major employer

Parker, who came to Stanford in 1974 as manager of employee relations, probably has done as much as anyone else to get the University to realize that it's not only an educational institution, but a major employer of staff personnel.

"In a place as diverse as Stanford is," he says, "it's very easy for people to feel isolated and not part of a larger organization. In many regards, the supervisor turns out to be the critical link between the staff member and the rest of the University.

"Whether that be a school, the University as a whole, or part of a vice-presidential area, the supervisor is called upon to interpret the University to the staff member—and vice versa."

Parker speaks not only of first-line supervisors, but all those who have the responsibility for directing and guiding others.

"While I think the quality of supervision at Stanford is good, by and large, we could focus on the role in many aspects—how work is assigned and evaluated, the attention given an employee's career development, or performance communication, for instance.

"The supervisor can convey whether the employee is seen as a whole person, with real needs and concerns outside of work as well as in the work place."

Parker stresses the effort to match people's skills and abilities with the University's needs in ways that are mutually beneficial.

"To the extent that we do that, the place is better for it," he continues. "The supervisor is essential in making that match work."

The good supervisor

What *is* a good supervisor?

Employee Relations Manager Felix Barthelemy responded to that question as follows:

A good supervisor 1) clearly states to staff the work that needs to be done and the standards of performance required, 2) gives recognition for work well done, and 3) addresses and assists employees in correcting problems as they occur.

"Most employees at Stanford are self-motivated and can be effective regardless of supervision," he says. "Supervisors need to know how to keep them motivated, how to avoid unmotivating them, and how to keep challenging them.

"If an employee does a good job even though supervision is poor, he or she ultimately leaves the job, because the supervisor does nothing to help develop his or her skills."

Supervisors needed

Stanford's self-motivated staff members may think they don't need any supervision, but they can't give themselves recognition, Barthelemy points out. In addition, the supervisor can keep the job in perspective.

"It's too easy to begin to see your job as an entity in itself, unrelated to the University," he observes.

This is particularly true in parts of the campus where employees have no contact with students or faculty.

"I'm amazed to run across staff members who have no understanding of what the role of the faculty is, or what their values are," says Parker.

"People in academic departments see the ebb and flow of students and faculty, course materials, and research, but staff who are not part of that can become estranged from what the primary mission of the University is, and they can feel resentful.

"There are many staff members whose only contact with a faculty member is when something goes wrong, and that's really unfortunate.

"Ultimately, our greatest success will be achieved when the whole staff supports and appreciates the faculty, and there's full recognition and respect of the staff by the faculty."

Communication important

Barthelemy sees the supervisorial role primarily as a relational one, with good communication the most important aspect.

"No communication leads to bad communication," he says. "If you're open, if the style of communication includes both good and bad, employees will feel comfortable with it."

Staff Development Manager Judy Moss agrees, and her courses in supervising reflect this.

"The supervisor's job is to communicate," she says. "It promotes security and makes the process of supervising a little more predictable. Often people think communication skills are magic, but they can be learned."

A few people, upon taking the course and finding out what being a good supervisor requires, have stepped down from their jobs.

"Some people get more satisfaction from the expertise of doing a job than from the relationships of supervising others," says Moss. "It can be frustrating as well as rewarding."

She and Barthelemy also encourage communication between supervisors and *their* supervisors.

"It's important that the manager should know what's going on," Moss says. "They should work out the department's objectives together. Stanford can offer courses in supervision, but the supervisor's manager must cooperate for the best results."

Some supervisors think that hostility from their charges is something they just have to live with. Not so, says Barthelemy.

"If hostility comes from employees, there's something else going on. It's probably that the employees think that the impact of decisions on them were not taken into consideration.

"When you make decisions, share the why of it or others will come to their own conclusion, and they all could be wrong. If they understand, they tend to be more positive. They should know the time and effort that goes into decisions."

A problem that leads many supervisors to sign up for the course is that of dealing with an employee whose work is not acceptable.

"Some supervisors tend to avoid unpleasant things, to procrastinate in doing something about them," says Barthelemy. "They hope the problem will correct itself.

"They think the employee won't appreciate being asked what the matter is, but frequently the opposite occurs. Most people know when they're not doing a good job, and often there's a sense of relief when it's brought up, particularly if the supervisor expresses a willingness to work with the staff member to improve performance."

Here's where the supervisor has to be *willing* to communicate, says Barthelemy—and that includes listening.

"Don't predetermine the cause of the problem," he counsels. "Go to the employee, bring it up, and ask why. If a person is doing poorly because he's ill, you can't cure a physical problem with disciplinary letters.

"Identify the real cause and look for possible approaches to correction."

The abusive supervisor

On rare occasions at Stanford, an employee is faced with a supervisor who is verbally or physically abusive. It may be that the supervisor doesn't know how to articulate work expectations, or there may be a deeper problem.

"It's important that the supervisor know it's not appropriate behavior," Barthelemy says. "Even if the employee leaves, the next one will have to deal with it."

In such situations the staff member should first make very sure he or she knows what the performance standards are or what is required. It is important that both supervisor and employee focus on work-related problems and not the personalities of the people involved.

In any case, an employee is not expected to put up with abusive treatment. The Employee Relations Office can help in trying to get people focused on the actual work problems involved.

Meanwhile, supervisory skills are used everywhere, on every level, at Stanford. Managers supervise their staffs, peers supervise each other, and often a supervisor learns something from a worker.

"The training is not a solution, it's a tool," Moss comments. "Its dual purpose is to get the work done well and give people job satisfaction. We aim for a general positive atmosphere on campus."

Balance necessary

Says Parker, "It's not sufficient just to make people feel good about the place if, in fact, the work's not getting done. And it's not sufficient to be taskmasters in a sweatshop if, in fact, you're burning the people out."

He would welcome demands from faculty and administration for even higher quality supervisory training.

Around 150 campus supervisors have taken the introductory course. They are the ones who keep reminding themselves to "focus on the problem, not the person"—a major part of the training.

There's a lot of leeway for personal style in supervising at Stanford, says Parker.

"But we want them all to keep in mind the common themes: the dignity and respect of the individual staff member: the belief that a person can grow; that the work will be done better if the employee gets attention; communication; and an emphasis on problem-solving."

—Pat Black

Campus Report welcomes ideas from staff members on what makes a good or poor supervisor. Do you have a particularly good one? Write or call Pat Black and suggest a story (News and Publications, ext. 7-2558.)

Strike. . .

continued from page 1

set for 10 a.m. Thursday at Rickey's Hyatt House in Palo Alto, will be held with federal mediator Dorothy Christiansen.

The proportion of bargaining unit members on the job has risen slowly from 27 to 36 percent.

Picketing activity was light Tuesday. Thirteen USW members and supporters were arrested Monday, Oct. 4, most of them while picketing the $36 million student housing construction site. Three others were arrested Friday, Sept. 30, including Michael Baratz, executive secretary of Local 715, for blocking traffic at SLAC and on campus.

The confidential University documents, reports from the compensation section of Personnel, show that Personnel recommended the University negotiate a contract with an 8 to 10 percent range adjustment for 1982-83. The documents also call for the addition of a new fourth step, 5 percent above step three and reallocations of certain job classifications to higher ranges. (See texts, this page.)

Asked how he obtained the documents, Baratz replied that they came from "Deep Throat."

The first document is a May 25, 1982, memorandum from compensation analyst Norma Starr to five personnel officials and University chief negotiator Priscilla Wheeler detailing comparisons she made between Stanford's bargaining unit salaries and those of local governmental agencies and corporations. She found Stanford's trades and crafts salaries lag the market at range maximum by 10 to 18 percent. Other job classifications also lag at range maximum, but several are competitive at mid-point or average salaries.

The second memorandum, based on the research compiled in May, contains final recommendations from Starr and Rosemary Monroe, assistant manager of compensation, on the bargaining unit salary package for University negotiators.

Wheeler said Tuesday that the University's final offer is "very consistent with the thrust of the Personnel proposals. But it is not identical because many recommendations are made concerning bargaining by different areas of the institution. All aspects of the University's position have to be brought to bear" in developing its offer, she added.

University President Donald Kennedy, speaking to the first regular meeting of the Faculty Senate Thursday afternoon, said the union's latest offer, made Sept. 17, was "simply not in the ballpark."

Kennedy estimated the USW proposal's cost, including compensation and benefits, at a minimum of 24 percent for the first two years. The University's final offer, made Sept. 7, was for a first year increase of 9.5 percent and increases of 7.5 to 10 percent in each of the succeeding two years. (See text, page 9.)

The union is demanding a two-year contract with a wage increase of 10.25 percent or $140, whichever is greater, the first year, and a 5 percent across-the-board increase plus a full new fourth step of 5 percent in the second year. The union also wants certain job categories reassigned to higher salary ranges and medical and dental benefits improvements.

In a union flyer issued Oct. 4, Baratz said USW offered to "submit the outstanding issues to advisory arbitration—an offer almost unheard of in labor relations. We took this risk because we are so confident of the fairness of our proposals. The University rejected this offer." **continued on next page**

Major portions of confidential compensation memos made public by USW

Following are two confidential memoranda concerning the University's position on the bargaining unit salary package which were obtained by United Stanford Workers and distributed publicly Oct. 1. The document dated May 25, 1982—excerpted extensively here—is a report from compensation analyst Norma Starr addressed to Felix Barthelemy, manager of employee relations; Douglas Dupen, SLAC personnel director; Paul Fearer, manager of compensation; Rosemary Monroe, assistant manager of compensation; Robert Parker, director of personnel; and Priscilla Wheeler, managing attorney for labor. The August 13, 1982, document—printed in full—was authored by Monroe and Starr, and is addressed to Barthelemy, Parker, and Wheeler. A check mark indicates the originals were sent to Wheeler.

May 25, 1982

In order to assess our market position for bargaining unit positions in preparation for upcoming negotiations we surveyed 16 positions that typify the broad range of BU classifications.

The surveys and ordinances we used were: SIRS (local companies), BASSC (Bay Area public and private sectors), UC, Lawrence Livermore Laboratory (LLL), Radford, City of San Jose, and the Livermore Survey. In addition we compared some local 715 contracts including San Mateo (City and County), Santa Clara County (S.C.), and the Cities of Palo Alto and Redwood City. Finally we compared LST positions with SRI, Syntex, and Alza, and compared Autopsy Room Attendent ranges with Palo Alto VA Hospital and Santa Clara Valley Medical Center.

In each case we looked at the average, or where not available the midpoint, and the range of salaries. In order to remove any extreme salaries we used the inter-quartile range for the BASSC and Radford data. In addition, we looked at the min-max spread as well as the number of steps in each range, in order to compare the length of time it takes to go through the steps of the surveyed ranges with Stanford's three-step ten percent ranges. It is important to note in this regard, that the majority of ranges (UC, San Jose, Palo Alto, Santa Clara) were five steps and they average 20-25 percent spread. However, both Santa Clara and San Mateo Counties had a one-step rate for several of their trades and crafts, which were not in the 715 contract. This rate was compared with our average salary rather than with the min or max, in order not to avoid skewed data.

In assessing this market data it is important to take into consideration the effective date of each ordinance or contract. Most of the organizations surveyed had July 1, 1981 effective dates, which compare with our November 1, 1981 salaries. It is presumed that they will have another salary increase on July 1, 1982 of 5-10 percent.

I. Overall Conclusions

In the trades and crafts, Stanford's averages generally lag the midpoints or averages of the market by 6-12 percent. However most of the ranges have a spread of 15-25 percent as opposed to our 10 percent. At the maxima, we lag 10-18 percent which is especially important since almost all our salaries are near range max. The exception is our strong market position with Stationary Engineers.

Our research/laboratory positions (Lab Mechs, S&E Techs, and LSTs) are generally mid-market, although we are 10-15 percent behind at range maxima. We do lead the average salaries for LSTs.

In service classifications our average salaries are competitive for groundskeepers and food service workers, while custodians lag 5-10 percent. Again we are behind the market 6-13 percent at the maxima.

Computer Operators and Senior Computer Operators average salaries lead all but S.C. County by about 12 percent; our ranges also lead the market except for S.C. County. Our Offset Press Operators II average salaries generally lead the market, although we lag slightly at the max. Graphic Tech II, III, IV, and Specialist are competitive on the average, but lag at the max 14-23 percent.

While selective reallocations in the trades and crafts and other selected classifications may help to improve our market position, there may be a need to increase the size of the ranges in almost all classifications to address our severe range maxima lag problem.

II. Recommendations

Objectives: Based on the preceding market information it is our intention to recommend a salary program which will attempt to improve our market position. Our proposal is for the first year of the contract. We will provide more information on other salary programs and contract settlements as they occur.

Recommendation No. 1: We recommend an 8-10 percent range adjustment for all classifications.

Recommendation No. 2: In addition we recommend adding a 5 percent Step 4 to increase the range spread to 15 percent. This would result in a total program of 13-15 percent the first year, in addition to the proposed reallocations described below.

Rationale: most of our Bargaining Unit employees are at Step 3, and many of them have been there for many years. We are lagging the market the most at range maxima. In addition, most 715 contracts have five steps and therefore, by adding an additional step we would be more responsive to long-time employees, as well as being more in line with other contracts.

August 13, 1982

After assessing our market position, Compensation prepared a proposal dated May 25, 1982, which summarized our market survey work and addressed outstanding salary issues related to the Bargaining Unit. The recommendations included: an 8 to 10 percent range adjustment for 1982-83, the addition of a 5 percent Step 4 and the reallocation of various classifications to address particular market lags.

During the past few weeks we consulted with representatives of various groups in the University including: Facilities and Services, SLAC, CIT, the Medical School, and DAPER to solicit their input on our recommendation and to inquire as to whether there were any additional Compensation issues which they believed warranted attention in the Bargaining Unit negotiations.

As we described in our proposal, our survey data shows that our most severe market lags are with the trades and crafts, specifically at range maxima. There are two ways to alleviate this problem within the constraints of the budget: increase the range maxima by adding a 5 percent Step 4, while providing greater in-hire flexibility or reallocate the pay ranges of most of the classifications. The operating units strongly support the first option, but do feel that a few select classifications lag the market so much that reallocations are necessary even with the other adjustments.

Section I represents our final set of recommendations. Section II describes those additional reallocations which Compensation and the operating units feel are necessary, if money is available, to preserve equity between the trades and crafts and to preserve or improve our longer-term market position.

I. Final Recommendations

A. Eight to 10 percent range adjustment for all classifications.

B. Additional 5 percent Step 4 to increase the range spread to 15 percent.

C. Greater in-hire flexibility.

D. Range Reallocations.

1. Move Principal S&E Techs from A39 to A41 to match the Lab Mechanician III range.

2. Move Principal Accelerator Operators from A39 to A41 since they track Principal S&E Techs.

3. Reallocate HVAC Mechanics, since both Facilities and Services and SLAC feel that this classification is their most serious recruitment and retention problem. In addition, HVAC is becoming more complex and may warrant a higher rate of pay.

Leader	A37	A39

4. Reallocate Greenskeepers since they are basically Maintenance Persons and the department feels that they should track the M.P. series.

	From	To
Greenskeeper	A18	A24
Greenskeeper Leader	A20	A26

5. Reallocate Book Warehouse Assistant to track Storekeeper and Deliverer, since the Press feels the people handling the books should be paid the same as those delivering the books.

	From	To
I	A12	A17
II—New level	—	A20

II. Additional Areas of Possible Reallocations

A. Reallocate Electricians and Plumbers to match the HVAC Mechanics reallocations.

We feel that reallocating one group without the other groups is somewhat short-sighted. The current depression in the building trades will not last forever; and we may end up lagging the market.

B. Reallocate Carpenters and Painters by 5 percent (two ranges) to correspond to the increases of other crafts. The rationale is the same as A.

C. Reallocate Maintenance Persons III-Premium and IV by 5 percent (two ranges) since they are journey-level crafts as well.

D. Reallocate Building Systems Technicians 2.5 percent (A37 to A38) to correspond with Plumber, Electrician, and HVAC Specialists.

We hope this information is helpful to you in negotiations and we would be happy to supply you with any additional information as you need it.

Strike. . .

continued from page 8

Wheeler said there was "no formal offer of arbitration, but had it been made the University would have rejected it." In arbitration, the parties "ask someone outside to make decisions," she said. "The University believes it is quite capable of doing that itself."

She criticized Baratz for his failure to maintain the confidentiality of the meeting, noting that "a number of things were said. . .that Baratz would not like to see repeated."

Pickets, who delayed entry of a skeleton crew Friday at the new student housing project, returned Monday in full force, keeping approximately 150 construction workers who were scheduled to work from doing so. Most construction workers had Friday off.

On Monday 45 pickets marched in front of the gate reserved for contractor Rudolph & Sletten. University officials contend such a picket line amounts to an illegal secondary boycott.

Several construction workers crossed the picket line in private vehicles, but most were content to honor the line. Pickets struck vehicles with their signs as the trucks and cars speed through.

Stanford police declared the gathering an illegal assembly, warned pickets they would be arrested if the remained, then moved in to arrest pickets who had sat down in front of the gate. Eleven Stanford police officers were on the scene. An additional seven officers from Palo Alto arrived as back-up, but did not take part in the arrests.

Five of the 10 arrested between 7:30 and 7:45 a.m. were Stanford employees, the others local labor leaders. Employees arrested were: Rhoda Love, radiology; Manuel Quesada, interdepartmental mail; William Devita, SLAC; Wouter Broers, SLAC; and John Quesada, operations and maintenance.

Labor leaders arrested were: James Potterton, director of labor studies, San Jose City College; William Twohey, board member of the Santa Clara County Central Labor Council; William Callahan, field representative of the American Federation of State and Municipal Employees; John Listinsky, senior field representative of Local 715; and Peter Cervantes-Gautschi, business manager of the Santa Clara County Central Labor Council.

Two additional arrests were made at the site in late morning: Edward Guthrie, SLAC, and Alfonso Dillard, who listed his occupation as unemployed USW member. Guthrie was charged with vandalism and Dillard with obstructing a police officer. Also in late morning, Enrique Bustamante, a laborer, was arrested at Bonair Siding for allegedly punching out a vehicle tire using nail spikes.

The dozen males were booked at North County Jail in Palo Alto. Love was taken to the sheriff's Elmwood facility for women in Milpitas for booking.

On Friday, Baratz and Charles Lacy, principal science and engineering technician at the Stanford Linear Accelerator Center, were arrested for allegedly blocking traffic at the SLAC entrance.

Early that afternoon, Linda Crouse, laborer at Tresidder Union, was arrested at Bonair Siding for allegedly obstructing traffic.

The University's strike information headquaters reported Monday that 839 out of 1,321 stayed away from work. When the strike began, 27 percent of the bargaining unit workers stayed on the job. As of Monday, 36 percent were working.

Reply to vivid display of injustice

Editor, *Campus Report*:

Professors Rebholz, Drake, Ruotolo, Islas, Todd, and Winkler have done us a great service, in their recent letter *(Campus Report, Sept. 29)* to you, by publicizing the results of their "reading between and under the printed lines" of the current Stanford/USW dispute. The possibility that there might be, in this "informative" letter, an underlying presumption of Stanford's malicious designs on the union could certainly occur to no reasonable reader.

Even with a remarkable investigation to their credit, however, Professors Rebholz *et al* manage to outdo themselves in a fascinating discourse on "the nature of justice" and their professional obligation as teachers to wean the typical Stanford student away from his natural and graceless state of indifference to injustice.

Indeed, having now this vivid display of injustice poised before them (i.e., their own Stanford's unjust treatment of the union), it is all too clear that even those few remaining good Stanford students will certainly "cease to admire and strive for a just society" just as surely as night follows day. That, unfortunately, is their nature.

But the most profound insight in this remarkable letter lies in its analysis of the grim racial implications of the USW strike.

Knowing as we do that the average Stanford student is an uneducated, uneducatable, prejudiced, weak-willed, and self-indulgent ninny, we can only agree that he will, as a result of the strike, have drawn the necessary conclusion about certain minorities. It is alarmingly obvious: "Services are being denied to me by striking workers; many of these workers belong to minorities; *ipso facto* these minorities are to blame for my problems."

The notorious susceptibility of Stanford students to racism, to injustice, and many other unfortunate tendencies, almost makes one wish that it were possible to completely isolate them from the real world—to lovingly shelter them from all bad examples and enfold them instead only in good influences in a kind of warm and prolonged love-bombing. That would be true education.

Undoubtedly the grave questions raised by the writers of this letter will have already persuaded university officials (however belatedly and shamefacedly) into *finally* bargaining in good faith. Certainly many in the Stanford community at large have benefited from a number of revealing insights. I should imagine, too, that at least a few of the students who have read this letter will be carefully examining their plans for course selection in the coming quarters.

University 'stonewalling'—Rebholz

Editor, *Campus Report*:

I want first to correct two errors I made in a statement of opinion in a letter on page 21 of the September 29 issue of *Campus Report*. The USW are asking in the first year an increase of 10.25 percent or $140 per *month*, whichever is higher, not per *week*. And USW is not an "open" shop but an "agency" shop in which non-union members covered by the bargaining agreement have to pay "agency" dues.

I want secondly to respond to a collaborative statement "by several administrators" in the same issue of *Campus Report*. That statement, representing the administration's viewpoint on the current labor dispute, was virtually repeated by Donald Kennedy in his statement to the Academic Senate on Thursday, September 30.

It is designed to place responsibility for the strike on the shoulders of USW by claiming that the administration moved quickly to its "final offer" of September 7, beyond which they could not reasonably go, and that the union had therefore no reason to strike.

Now, with the union's recent publication of a recommendation by the administration's own Compensation Department, prepared by Norma Starr and Rosemary Monroe, we learn how dubious the administration's claim is. On August 13, Compensation reiterated its recommendation of May 25 that *in the first year* the administration offer an eight percent to 10 percent increase in addition to the immediate introduction of a new step 4 of five percent; that is, a first-year increase for most workers of between 13 percent or 15 percent.

Instead the administration made its "final offer" of 9.5 percent in the first year and a phasing in of a fourth step of 2.5 percent in the second and third years of the contract. In other words, the Compensation unit believed that the administration should move quite beyond the "ultimate point" which unnamed administrators and Donald Kennedy have announced.

I can reach only one conclusion. The administration is stonewalling in order to humiliate USW so that the Hospital workers, in addition to others who might unionize, will reject that option. That conclusion is in keeping with the administration's refusal of the union's almost unthinkably generous offer, made last Thursday, to go back to work and refer the dispute to advisory arbitration. It is in keeping with the refusal of Priscilla Wheeler to answer questions, raised by the residence staff at Trancos, about wages, medical benefits, and dental benefits received by comparable workers in Santa Clara County.

It is in keeping with the refusal of Priscilla Wheeler or her associate, Felix Barthelemy, to accept an invitation from the residence staffs of Madera and Trancos to address students on the issues and answer questions.

It is in keeping with the stony coldness of Donald Kennedy's tone in his address to the Senate on the issue—a tone I at least have never heard him use at Stanford.

Surely the time has come for the administration to make a move towards settling this dispute. If Priscilla Wheeler or Donald Kennedy would undertake a tour of duty as a Resident Fellow in an all-frosh dorm and try to plan evening and week-end meals for 80 hungry students, I think they might break through their cold, stone wall.

Ronald A. Rebholz,
Professor, English
Resident Fellow, Trancos

'Significant' union move needed in negotiations, Kennedy tells Senate

Following are comments by President Donald Kennedy to the Faculty Senate Thursday, Sept. 30.

Now let me talk just briefly on the matter of the strike. I want first to assure my faculty colleagues that I understand and deeply regret the inconveniences that have been caused to faculty members, to academic departments, and particularly to those who do the important work of residential education. For reasons that I shall explain, however, I do not believe the University administration can be held responsible for the strike or its various unpleasant sequelae.

As you know, negotiations were resumed yesterday, and continue today. There is, regrettably, little progress to report (from yesterday). I want briefly to tell you why we are where we are, and to state the conditions for future progress.

The article printed in the Stanford *Daily* Tuesday and in yesterday's *Campus Report*, which was a collaborative effort on the part of several of us, sets out our view of the history of the negotiations. Neither that history, nor the existence of a strike which, in our judgment, was both an inopportune and ill-advised move on the part of USW's leadership, supports the conclusion that we have been intransigient.

On the contrary, we began our negotiation from a realistic level, and made improvements in our offer in such a way as to signal clearly what our final zone of settlement would be. Surely it must be clear that we will end this process somewhere in the vicinity of the total compensation established last spring for the various nonunionized groups of Stanford University and Stanford University Hospital workers.

Since those increases were established there has been a substantial reduction in the inflation rate; I suspect that had there been more inflation instead of less, USW negotiators would be urging that it be taken into account. The point is that a final offer near, but not necessarily at, the improvement levels already established for other groups is quite clearly all our capacity will permit.

The strike was called after a University offer that included a 9.5 percent increase for the first year—quite close to the increases given the others last spring. USW, since the strike began, has made a counter-offer that they describe as involving major concessions.

Some of our colleagues, in a recently-published letter, have apparently accepted that characterization; they describe the positions now as "close." That is wrong. The union's latest offer involves increases, in compensation and benefits, a *minimum* of about 24 percent for the first two years. That offer is simply not in the ballpark.

I would reiterate that a significant move by USW now is required to get the bargaining process out of its present impasse. And I emphasize again that the University, having started at a reasonable level and having tried responsibly to settle at an early stage in this process, has very little flexibility left.

I need not tell you, I hope, that Stanford wants to be fair—but that we must also take a comprehensive view of fairness that includes in addition to bargaining-unit workers—principal investigators, tuition payers, and those who are responsible for academic programs. If we misallocate resources in this area to avert the inconvenience of a strike, we will damage other parts of the institution in these difficult times. I hope no one will mistake my own determination on this point.

Those experienced with labor negotiations, here and elsewhere, have had a good deal of difficulty in interpreting this strike. It is said to be about an unfair labor practice, yet actually deals with contract terms; and the union leadership, instead of using the process of collective bargaining seriously, has sought to settle it in every other way possible—on the picket line, in the media, by political pressure, and now finally by personal harassment. But it will be settled only at the table—and only through the introduction, by USW's representatives, of a note of realism in the bargaining process.

Kennedy: Science, liberal arts are deeply intertwined

Following are remarks by President Donald Kennedy to the University of Oregon fall convocation, Oct. 4, on "On Science and Culture."

Introduction

It is a great pleasure to be at the University of Oregon for this Convocation. And in particular it is a privilege to be able to bring greetings from Stanford—a friendly neighbor who shares much of your history, many of your strengths, and expect nearly all of your ideals.

The small handful of major research universities in the Far West, whether public or private, share some important roots. Because they had their origins late in the nineteenth century, and were accordingly unencumbered by a long history, they were able to draw from their very beginnings on two important traditions: the classical commitment to liberal learning, on which the older eastern institutions were founded; and the German-derived nineteenth century emphasis on independent study, graduate work, and training for the specialties.

At institutions like Oregon and Stanford, these were blended with a third stream — the uniquely western concern for applied knowledge that was embodied in the Morrill Act and in the strong science and engineering schools that developed in the west. Stanford and Oregon both have the diversity and the scientific strength that is characteristic of their growth from this multiple graft.

Perhaps, then, it is reasonable to suggest that our institutions ought to pay *special* attention to the bridges between the sciences and the humanities. People and places strong in the scientific tradition have infrequently undertaken that obligation. On the contrary, they have seemed awkward and diffident about the challenge to do so — as though they somehow believed that the traditions of the humanities were more powerfully "intellectual" and therefore ought be conceded the leading role.

As you will discover later, I do not accept that premise; indeed, I think there are good reasons why institutions like ours — in which science and "liberal culture" shared prominence from the begining — are the places in which they can best be brought together again.

The Nature of the Problem

Scientific Literacy

Why is this task worth our attention? Why is it important that all of us—scientists and humanists alike—understand the linkages between science and the humanities? I want to dispense rather quickly with two reasons, and then concentrate upon a third.

The first reason, to which a good deal of recent attention has been paid, is the straightforward problem of scientific and technological illiteracy. There are abundant signs that this is a national defect worth taking seriously.

We live in a high-technology society, and almost every public policy question with which we grapple is laden with technical and scientific content. To be an educated citizen increasingly requires a familiarity with the basic concepts and the vocabulary of science. But it is painfully obvious that we have difficulty bringing the most rudimentary scientific rules to bear even on the business of discriminating sense from nonsense.

Numbers of our fellow citizens can readily be persuaded that they can be made more powerful by pyramids, cured of cancer by eating apricot pits, lost forever in something called The Bermuda Triangle; able to pick cards or bend spoons by concentrating hard enough; and made svelte forever by a diet from Scarsdale this year, or Beverly Hills the next.

These are danger signals, all right, and I agree with those who say that among the obligations of scientists is the defeat, through the broadest kind of general education, of this vulnerability to scientific faddism and —even worse — our prediliction for uncritical scientific judgments about decisions facing our society.

The 'Specialness' of Science

A second reason is the degree to which science is separated artificially from other forms of human activity, and credited with rules, standards, and procedures that do not apply to other kinds of thought and analysis.

I claim to have received an advanced education about this phenomenon during the two and a half years I spent as head of a Federal scientific regulatory agency. What I found most startling there is the strength of the belief that something called *science* and something called *policy* can exist in absolutely water-tight compartments. It is, in my judgment, a dangerous fiction.

For example, the Congress regularly establishes desired social outcomes and sets scientific standards that it believes will achieve them. But when a scientific process so specified yields a result that makes voters unhappy, it is often the science that is attacked — under the mistaken impression that it is not really a part of the policy.

I arrived in Washington to take over the Food and Drug Administration about three weeks after the Agency had received the results of animal tests that required it to remove saccharin from the market under law. I received a number of challenges on that matter from members of Congress, mostly attacking the animal tests and their rationale.

By artificially isolating science from policy, I suspect they moved the argument to smoother ground. If you are running for reelection it is much more comfortable to discuss the question "are animal tests appropriate for estimating human cancer risks?" than the substantially more germane question "should weak carcinogens that people like be permitted in the food supply?"

Conversely, it was very difficult to explain that science is full of embedded "social policy." I repeatedly heard testimony before congressional committees in which the results of an experiment assessing the risk of some substance were stoutly represented as "significant" by one group, and equally stoutly as not "significant" by the other —one set of advocates claiming that a particular result *exceeded* the 95% confidence level, and the other arguing that it barely failed. Everyone seemed to accept that threshhold as deeply "scientific."

I regularly produced shocked disbelief by pointing out that this threshhold of statistical significance is a convention chosen to support a policy. Science is an activity in which reliability has high social significance, and accordingly scientists have declined to accept a result unless the probability is very low (e.g., 1 in 20) that it could be due to chance alone.

We selected that value through a social process entirely analogous to the one that established "beyond reasonable doubt" as the standard of proof in the criminal justice system. It is thus a social covenant, expressed in scientific notation.

Without the notation, it reads: "I want to base the scientific enterprise upon results that are nearly certain, not merely quite probable." That may or may not be the right standard for, say, the social determination of risk. In a similar way, we built our criminal justice system on the covenant that we much prefer to let the guilty go free than wrongly to punish the innocent. But that is not the standard we apply, for example, in the civil courts.

My point is simply that social policy and science are much more closely intertwined than is commonly thought. In the end, that was the most dominant theme of my period of exile in government.

Despite our affection for science and for scientific precision, these cannot help us decide what we want, or how much of it. They can only help us arrive at those decisions or to live by them. In the search for policies science thus may clarify and inform the discussion, but can never dominate it.

To be an educated citizen increasingly requires a familiarity with the basic concepts and vocabulary of science. But it is painfully obvious that we have difficulty bringing the most rudimentary scientific rules to bear even on the business of discriminating sense from nonsense.

—Donald Kennedy

Science as 'Culture'

But neither of those arguments for reintegrating the sciences and humanities is the one I want to concentrate upon today. There is another kind of isolation between the sciences and "liberal learning" that may be even more damaging in the long run. It is the failure to understand the powerful interpenetration of scientific and humanistic ideas — and the resulting loss of much of science *as* culture.

Perhaps as a consequence of the increasing public mystification about science, there is a troublesome tendency to regard science as providing a separate stream of intelligent thought about what human society is and what it can become. I said before that I think scientists have been shy about staking a claim to the broad intellectual significance of their own subject matter. They have been content to accept the label "pragmatic" or "practical," and humanists, in turn, have been too willing to take them at their own evaluation.

It is these fundamental interrelationships to which I want to devote the rest of this talk. It should already be evident that I think a crucial educational objective is to be sought here; it is the serious pursuit of the implications of scientific discovery for liberal learning. I regard it as a special contribution that institutions like ours — strong in science but committed to the full range of cultural exploration — can make.

Darwinist and 'Human Nature'

Nowhere can the case for elision between the sciences and the humanities be more compelling than in the area of evolutionary thought. Yet ironically, it was the Darwinian Revolution that probably created the "two cultures" problem in the first place.

As long as one could be confident about the static character of the universe, of the physical landscape of Earth, and of the nature of its inhabitants, a single and coherent system of natural philosophy could embrace the humanities and the sciences. But the triumph of dynamics over statics is an event we have seen repeated again and again in two centuries, from the Copernican revolution to plate tectonics and the instability of the genome. Of all these upheavals, the one Darwin produced surely had the greatest impact on the unity of human knowledge.

The last great period of confidence in the unity of human knowledge was the Enlightenment. That confidence rested largely on the dominant position of theology in natural philosophy. God the Creator oversaw a clockwork universe that moved according to a set of revealed principles; and within it was a Sacred Earth, whose land forms were reshaped only catastrophically for the purpose of punishment, and whose creatures were immutably set in the pattern of their own Creation.

The range of organic diversity and the intricacy of morphology thus became, in the hands of the great naturalists of the 18th century, at once sources of wonder and reassurance. Listen to William Paley:

"...in every nature and every portion of nature which we can descry, we find attention bestowed even upon the minutest parts. The hinges in the wings of an earwig and the joints of its antennae, are as highly wrought as if the creator had had nothing else to finish." Later Paley adds the homily:

"We have no reason to fear, therefore, our being forgotten, or overlooked, or neglected."

During the eighteenth century, and with accelerating force in the nineteenth, that view was challenged by a series of scientific revolutions.

The first was cosmological, and had the effect of making the Creator more and more a spectator in His own universe.

The second, much more troublesome, was geological. Hutton and then Lyell challenged and ultimately routed the notion of catastrophism, and substituted for it the gentle dynamics of erosion, sedimentation, and other gradual processes. That Lyell eventually went too far with uniformitarian doctrine is not very important; in the mid-19th century, his gradualism screamed out to be transplanted from the nonliving to the living world.

That, of course, was the contribution Darwin made in the *Origin:* the demonstration that slowly-acting selective forces in the environment changed the *nature* of living beings over time, just as erosion and sedimentation changed the landforms.

Darwin's laborious demonstration that biological species are not immutable was often represented as a theological revolution: but it was much more a philosophical one. No one supposed that Creation had been disproven, only Special Creation. God had not been denied, only forced to retreat still more into the spectator's role: instead of making creatures, He had made a Plan for their evolution.

Darwin himself saw no loss of divine majesty, but a gain:

"There is a grandeur in this view of life, with its several powers, having been originally breathed by the Creator into a few forms of life or into one; and that, whilst this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning endless forms most beautiful and wonderful have been, and are being evolved."

That does not sound much like religious heresy, but it *was* academic heresy. What Darwin had accomplished, for once and for all, was the demonstration that a single way of knowing was no longer possible. And as a consequence, the strongest reaction in the end came not from the pulpit but from the Dons of Cambridge and Oxford.

John Dewey later said:

"Although the ideas that rose up like armed men against Darwin owed their intensity to religious associations, their origin

continued on next page

Kennedy speech...

continued from page 10

and meaning are to be sought in science and philosophy, not in religion."

After Darwin: Biological Determinism

In addition to overthrowing the unity of natural philosophy, Darwin launched a new and troubling vision of humankind. The shaping of form and function — the 'nature' of organisms — by natural selection raised the prospect of a phylogenetically determined human '*nature*.' That prospect, reinforced by twentieth-century genetics, has in turn reformulated some of the most profound social issues of our time.

The Darwinian view of natural selection was promptly seized, and promptly misapplied, by proponents of the world's great competing systems of political economy. Herbert Spencer, and a succession of clumsier imitators like Andrew Carnegie, employed 'survival of the fittest' as justification for the human competition in 'free enterprise.' In doing so they mistook economic fitness for reproductive fitness, an error occasionally repeated by foolish men and women even today.

The Marxists, on the other hand, found the vision of biological determinism so deeply threatening that they were driven to extraordinary inventions for getting political economy back in the drivers seat. So desperate were these that they reached back a century before Darwin to a failed doctrine that held inheritance to be under direct environmental control. The establishment of Lysenko's version of Lamarckianism as a state scientific religion in the Soviet Union for a third of the twentieth century was the result. Anyone who doubts the power of the connection between science and culture should examine that case as a cautionary illustration of its potential for mischief.

Today one would suppose, listening to the largely political debates between Right and Left over how much to attribute to Nature and how much to social forces, that the same issues are still dominant.

Surely they have found an acrid recent focus around the coined discipline of sociobiology. The key question claimed by the sociobiologists—how behaviors can be selected when they primarily influence the survival of others and not the behaving individual—is an important one. But it is hard to see it as the centerpiece of our understanding of cultural and biological co-evolution—let alone of how we should organize political economies. And in fact I think the focus on sociobiology has overshadowed some more interesting cultural consequences of post-Darwinian thought.

The World and the Self: Biological Determinism and Freedom

These, I would argue, involve our most basic notions about freedom, rationality, and equality. And the questions arise not out of genetics and evolutionary biology, but out of the human sciences themselves: psychiatry, psychobiology, and neurobiology.

In historic terms the real scientific successor to Darwin was Sigmund Freud. To Darwin's base of phylogenetic determinism, Freud added the mind as a part of what was determined; and he also added a powerful set of ontogenetic determinants to the phylogenetic ones. Human nature, in the Freudian view, was dominated by evolutionary shaping and by "early influences" upon the psyche.

In effect, Freud made the mind part of biology. Kant had recognized madness to be biological, but held all else in the mind to be moral and rational. Freud and the modern psychiatrists, biological *and* behavioral, put all mental process on the same continuum; they made mental illness part of the human condition or, perhaps even the reverse.

Alan Stone points out that "psychiatry, after declaring madness a biological disorder, is haunted by biology in its understanding of the rest of humanity." And he goes on to say: "All of the dominant conceptual paradigms of modern psychiatry, biological and behavioral, conflict with traditional ideas about free moral agents." One does not have to go *that* far to perceive the challenge that psychobiological determination poses for the notions of free will and moral obligation.

Indeed, in just a hundred years, the biological sciences have triggered a most extraordinary reordering of our concept of what it means to be human and to be free.

It is a view so new and so robust that it sometimes threatens to crowd out traditional choice and conventional morality. The focus on the individual is so powerful that the World shrinks as the Self swells.

If there is a defect in our behavior, if we fail in what we suspect may have been an obligation, there are a host of comforting explanations: selfish genes, oppressive early experiences, or defects in catecholamine biochemistry. Finding an ethical path within our new vision of self is one of the great tasks of contemporary humanism.

Perception and Reality

At the same time, our view of reality has been reshaped in a way that also tends to internalize and individualize it. One's perceptual surround, we now understand, is profoundly affected by patterns of neuronal connections that have been assembled over evolutionary time, and often refined during early development, to extract features of the world that are of particular relevance.

There is not one single objectively verifiable world; there is, rather, the cat's world, the bird's world. There is likely even a catraised-with-vertical-stripes world, and a bird-raised-with-foster-parents world. Each reflects a phylogenetic interaction between ancestral cats or birds and a set of antecedent "worlds," modified somewhat by early experience. And if these things are true what guarantee have we of the rationalist's fundamental assumption that *you* and *I* inhabit the same world?

These new propositions about reality and rationality are the more troubling because we are now being told that the process of perception may actually extend much further than we thought — that is, beyond sensory qualities like brightness and audibility to things we are more accustomed to call "values."

Psychologists and neurophysiologists have shown that various sensory systems exhibit "range compression" — that is, become less sensitive and able to discriminate as stimuli become more intense. Their observations, solemnized years ago as the Weber-Fechner law, explain why we can detect a difference of one gram between two relatively light weights, yet barely recognize a ten- gram difference if the weights are an order of magnitude heavier.

We once scoffed at the idea that such laws of perception could be applied to the measurement of more complex parameters, like value or risk. Yet some strikingly similar rules are emerging from tests of human preference that utilize choices between rewards or risks of different magnitude and probability.

It is a sobering thought that our biological endowment may actually fix and establish many of the parameters we thought belonged to an external world. It is even more sobering that we may be biologically — innately—committed to some qualities we thought we were choosing freely, on the basis of individual experience with our surroundings. Again, the Self swells and the World shrinks.

Equality

That brings us finally, to equality — or rather, it brings us *back*; for it was the impact of biological determinism on notions about equality that tempted Carnegie and the Marxists into their futile wrestling- matches with evolution.

Darwin's intellectual legacy is not merely that some individual differences are a consequence of biological endowment, nor even that they may involve the "mind" and perhaps perceptions as complex as value. It is that these individual differences are substantial enough to react to subtle selective forces, and give rise to large differences in reproductive fitness.

The *Origin of Species* and its twentieth century offspring —genetics, psychiatry, neurobiology — have brought us to an expanded view of what is within us, as opposed to what is without. As a consequence we are obliged to enlarge our respect for the degree of individual difference.

What does that say about equality? To many, it seems to damage the very notion. That view — held by many of those most repelled by the notion of biological determinism — seems to me quite wrong. Equal is not identical; different is not unequal.

Social equality, that is, equality of opportunity, is simply not on the same continuum of choice with biological similarity. To admit a degree of inherent difference does not constrain our views of equality. It would be tragic if it did, for we need more and not less respect for individuality, which *means* difference.

The great challenge for human society, it seems to me, is to abandon the denial of biological differences, and turn to the reformation of social opportunity so that it can fairly and gracefully accommodate these differences.

Conclusion

Where have we come? I have tried to show how just one branch of science—the biology of the past hundred years—has provided much of the substance for the most humanistic enterprise of all, that of deciding *what is human*.

It has, furthermore, irrevocably changed how we think about the most social activity of all, that of designing political economies. A direct outcome of the evolutionary paradigm and its successors has been a profound reorganization of our views about human freedom, human rationality, and human equality.

I would like to close by suggesting an emerging metaphor for the connection I have tried to demonstrate between science on the one hand and the humanities on the other.

Exactly that same kind of relationship, it is now clear, exists between biological and cultural evolution. Accelerating culture becomes the *milieu* in which the selection of biological capacities takes place; and the latter, in turn, stir further quickenings in the pace of cultural evolution.

So tight and so effective is this interplay that it has wrought the most rapid change in biological structure since evolution began — the growth of the human neocortex. And it has also produced, of course, a rate of change in the cultural *milieu* that is bewildering and sometimes frightening.

A result of the interplay between the two kinds of evolution, unexpected when it was first seen, is a convergence of cultural practice and biological nature, i.e., a matching between cultural and genetic fitness. This close coupling between the two kinds of evolution offers the optimistic suggestion that in time, there is likely to be a complementary relationship between our biological endowment and our social arrangements.

I hope that notion might be serve as a metaphor for our exploration of science and culture as human activities. We cannot be human and whole without reference to both. Uprooting the humanities from science robs us of a critical understanding: that they are joint products of a co-evolutionary process, just as surely as the brain and culture are. That unity is the brightest and most exciting academic vision we could possibly have.

Over half of MBA graduates declined highest salary offer

One-third of the MBA graduates from the Class of 1982 at the Stanford Business School again took jobs with manufacturing companies—sustaining a trend that began last year, the School's annual employment survey shows.

The number of MBA graduates who went to work for manufacturing companies stands at 35 percent this year, the survey shows. It increased from 28 percent in 1980 to 36 percent last year.

Almost half of those graduates who chose manufacturing firms went to work for manufacturers of electrical and electronic equipment.

However, this year's graduates found fewer opportunities with large energy firms and manufacturers of consumer goods, paper products and motor vehicles—the kinds of companies that have been particularly hard-hit by the nation's ailing economy. Only 10 percent of the class took positions with these industries, compared with 15 percent last year.

Among the two-thirds of the 1982 MBA graduates who took positions in non-manufacturing areas, 22 percent of them went to work for consulting firms and 15 percent took jobs with investment banking firms. Slightly fewer graduates took jobs in commercial banking and other financial services this year—13 percent this year, down from 15 percent last year.

Five percent of the graduates took jobs with the government or with nonprofit organizations.

In a reversal of a recent trend, fewer graduates were hired by firms that employ under 100 persons, according to Richard Johnson, director of the Career Planning and Placement Office at the Stanford Graduate School of Business. Citing the sluggish economy as the cause, Johnson said only 16 percent of the graduates took jobs with these very small firms this year, as contrasted with 23 percent who did so last year.

The economy was also apparently the reason for a five percent decline in the number of organizations that interviewed graduating students at the School. This year 202 firms completed over 3,600 campus interviews with graduates.

The 1982 employment survey again does not make public the average starting salaries for the graduating MBAs because of a policy adopted by the Stanford Business School last year. Johnson said the School wants to discourage the "exaggerated emphasis" that has been placed on the MBAs' starting salaries in recent years.

Johnson noted, however, that the survey shows that 51 percent of the graduates did not accept their highest salary offer.

He added that on the survey the graduates ranked salary as being only moderately important in choosing among job offers. They instead ranked an intellectually stimulating job, compatibility with people in the company, and the opportunity for early responsibility as the most important considerations in accepting a job offer.

The survey's breakdown of jobs by function indicates that the 1982 MBAs differed little from their counterparts in the class of 1981: 27 percent went into finance, up from 23 percent last year; 22 percent went into consulting, up from 20 percent last year; 18 percent went into marketing, same as last year; 9 percent went into line management, same as last year; 7 percent went into corporate planning, up from 6 percent last year; and 4 percent went into operations management, same as last year.

Employers hiring four or more graduates of the class of 1982 were Atari, Inc.; Bain and Co.; Booz, Allen and Hamilton Co.; Cummins Engine Co.; First Boston Corp.; Goldman, Sachs and Co.; Hewlett-Packard Co.; IBM Corp.; Lehman Bros. Kuhn Loeb Inc.; McKinsey and Co., Inc.; Morgan Stanley and Co.; and Rolm Corp.

Sustained effort needed on faculty affirmative action

Following is a report of the Committee on Faculty Affirmative Action, July 6, 1982:

Introduction

Late in 1980, President Kennedy and the Academic Senate formed this ad hoc committee to review the University's faculty affirmative action program and to make suggestions for its improvement.

The committee met through most of 1981, with a break during the summer quarter. In its initial meetings, the committee reviewed the University's search requirements as well as its hiring and retention statistics. In addition, members of the committee interviewed some departmental faculty affirmative action officers and others who have had special experience in either affirmative action or faculty recruiting, as well as some minority and women faculty.

As these meetings progressed, it became apparent that there was a consensus on several issues. These form the backbone of this report. In particular, this report contains:

a) A statement on why faculty affirmative action should be continued and strengthened at Stanford, even if external pressure is reduced or withdrawn.

b) Proposals for an organizational structure and other practices which are likely to increase the effectiveness of recruiting women and minority group members to the faculty.

c) Proposals for and restatements of policies which are likely to increase the probability of minority and women faculty being successful here and being retained with tenure.

d) Some observations about the special responsibilities of women and minority faculty.

Why Affirmative Action?

Three basic affirmative action concepts formed the context of the committee's discussions.

The first is that the University should seek the very best scholars and teachers for its faculty. Any implicit or explicit biases which tend to eliminate certain groups from serious consideration on the basis of race or sex must necessarily yield a faculty of lower quality than what might be achieved without such biases. This goal argues for a faculty affirmative action program which seeks to eliminate sexual and racial basis from the selection process.

The second is more subtle. It is clear that Stanford University's students are extraordinarily capable. Nevertheless, they share the uncertainties about themselves which are characteristic of young people who seek significant achievements. For many women and minority students, the uncertainties are enhanced by racial or sexual images which abound in the general society.

It is our belief that these students are much more likely to overcome their uncertainties, achieve their potential and make their contributions to society if they have contact with and identify with outstanding women and minority scholars and professionals. Stanford's faculty affirmative action program should insure that such contact-takes place through steady increases in the numbers of women and minority faculty.

Another significant benefit of an effective affirmative action program is that our majority students are less likely to accept pejorative racial or sexual stereotypes as a result of having studied with oustanding women and minority scholars and professionals.

Finally, we are all keenly aware that one of the deepest and most important outcomes of an undergraduate education is the developed awareness that different peoples view the world in quite different ways and with different values.

An effective affirmative action program is likely to enrich the intellectual atmosphere of the institution and this awareness by bringing to it outstanding scholars with quite different backgrounds, even if the process which leads people to become "outstanding scholars" tends to be a homogenizing process.

A retrospective view of the enrichment of American higher education by successive waves of immigrants from different parts of the world, bringing with them differing talents, emphases and values, must necessarily lead us to believe that this process will continue with the introduction to our University of more women and minority group members.

Review of Affirmative Action Procedures and Results

Our review of faculty hiring and retention statistics led us to believe that the University, for the most part, has hired women and minority group members over the past eight or nine years at a rate which is equal to or greater than what would be expected on the basis of national Ph.D. conferral rates. What's more, the junior faculty among them have been retained with tenure at a rate which is equal to or greater than that for white males. In spite of this, the situation is not a good one.

There are just not enough women, black or chicano faculty—tenured or nontenured—at this University to meet its perceived needs. The small number who are here are overburdened with justified requests from students for advice and leadership, from the University for special services ranging from multiple committee memberships to presence at a variety of special gatherings and from the local minority communities for a variety of contributions.

These requests, all too frequently, take the faculty away from the scholarship which makes them attractive to the University. Time and time again, the committee members heard minority and women faculty members speak of the fatigue which comes from serving so many years in this special role, and of the desire for the more normal roles of teaching and research which will come when there are more minority and women faculty to share the other advising and University service functions.

It seems essential, therefore, that the University take special pains to assure that it never fails to hire, through inattention to proper search procedures or inaction in the face of opportunity, a woman or minority group faculty member whom it should have hired.

Similarly, the University should never lose a talented person at the tenure decision because of poor planning, guidance, and leadership in the face of the various demands for his or her time and energies.

Finally, the University must recognize that faculty affirmative action should remain an active process for at least a decade, because hiring rates are low and we have a long way to go before we have sufficiently large numbers so that a woman, black, or chicano faculty member can devote his or her time almost exclusively to teaching and scholarship for a year or two and still assume that the other University needs, discussed above, are being met. Thus, in spite of the apparent "fairness" of the existing procedures, we propose improvements below.

Organization of Faculty Affirmative Action

There is little doubt that faculty affirmative action has been one of the most controversial issues of the last two decades related to American university policies and practices. Unless carefully considered, it may place various important University goals in conflict. It may enrich the institution through wise action, or weaken it through expedient action designed to meet political rather than academic objectives.

Because the need for affirmative action will be with us for a long time and because of the potential importance of its consequences, it is our belief that there must be a standing organization which regularly reviews and discusses thoughtfully the University's fundamental objectives in affirmative action, its progress in meeting those objectives, the appropriateness of various existing and potential search and selection procedures, the procedures and policies of other universities, any changes in the surrounding world which influence affirmative action and the University's response to those changes.

That organization should make recommendations for changes in policies and practices as they become appropriate and should also assure their implementation. That organization must, finally, come from and be intimately linked with those responsible for faculty affirmative action—the faculty.

It is the committee's belief that the University has gone part of the way toward achieving such an organization through the appointment of school and, in some cases, departmental faculty affirmative action officers (FAAO). We must now proceed to assure that these officers know, consider and understand University policies and practices, that they participate appropriately in departmental searches and that their experiences, in turn, influence University policies and practices.

The assemblage of departmental affirmative action officers should constitute a Faculty Affirmative Action Board which should have the University Committee on Faculty Affirmative Action (UCOFAA) as its executive committee. The UCOFAA, in turn, should have a good representation of departmental affirmative action officers among its members.

The full board should meet at least once each quarter to discuss University policies, procedures and departmental experiences, as well as its own role. UCOFAA should be responsible for the faculty affirmative action review and recommendations described above and for leadership of the meetings of the board. UCOFAA should assure that each departmental officer understands the responsibilities of the position, the University's search procedures and requirements, as well as the means by which candidates may be effectively sought. UCOFAA should assure, in addition, that the procedures and requirements are changed as the University's or the outside situation changes.

Kennedy: Educational goals are best served if institution reflects diversity of society

The foundation of all policy at Stanford University is the institution's determination to maintain itself as a university of the highest quality. Implicit in that tenet is the University's determination to provide equal opportunity for all employees and applicants for employment regardless of race, color, creed, religion, national origin, sexual preference, age or sex, except where sex or age is a bona fide occupational qualification. Similarly, individuals with physical limitations are evaluated on their ability to perform a specific job rather than on assumptions about their disability.

The plan for affirmative action described here is intended, in ways that are consistent with those premises, to increase the number and improve the relative position of minority group members and women on the Stanford faculty and staff. And while proportional representation by race and sex is not necessary in every institution in a pluralistic society, Stanford's educational goals are best served if the institution reflects the diversity of our society at all levels.

The University has frequently stated its policy of equal employment opportunity. Because we are committed to avoid discrimination in personnel decisions, we intend to remain an equal opportunity employer. But the mere avoidance of direct discrimination, even where that can be fully achieved, does not by itself guarantee the desired changes in the composition of the faculty or staff.

To achieve such changes requires affirmative action. Hiring decisions that appear to have been reached neutrally may in fact be discriminatory if the applicant pool does not include women and minority group members. The traditional "old boy" networks for establishing criteria, locating applicants, and making recommendations can perpetuate the problem. Positive recruiting is, therefore, basic, and the need for careful review of stated qualifications goes hand in hand with open recruiting. Overly narrow qualifications may artificially and improperly exclude from consideration members of minority groups and women who could assume the responsibilities of a vacant position.

The University is fully committed to an affirmative action program. It consists, in part, of the following elements: 1) a requirement for imaginative and serious search and recruiting; 2) administrative review of hiring practices; 3) analysis of faculty and staff units to determine problem areas; 4) identification of and response to undesirable practices; 5) facilitation of training where possible and consistent with the educational objectives, that permits personal development sufficient for entry to some positions and promotion to others.

Stanford's officers who are responsible for affirmative action believe that these procedures will make Stanford University an affirmative action employer in the best sense of that phrase and will improve the representation of women and minority group members in the faculty and staff.

Donald Kennedy
President

Faculty Affirmative Action/continued from page 12

Role of Departmental Faculty Affirmative Action Officers

The role of the departmental faculty affirmative action officer (FAAO) will, presumably, be refined by the faculty affirmative action board as organized experience develops further. Here, we provide an initial assessment of the FAAO's responsibilities.

Interaction with Search Committees—The primary role of the FAAO is to assure that the affirmative action aspects of the department's search and selection procedures are carried out effectively and with integrity. To achieve this, the FAAO should:

a) Meet with each search committee chairperson prior to the initiation of the search to discuss the University's affirmative action expectations, to provide guidance and to help develop strategies for the more effective inclusion of affirmative action concerns in the actions of the search committee. At that time, the FAAO should provide the chairperson with relevant rosters of women and minority candidates as well as the names of organizations and individuals who might enhance the affirmative action aspects of the search.

b) Meet with each search committee to review its affirmative action plans at a time which is early enough so that these may be altered, yet late enough so that the committee has had time to consider what actions are relevant to its particular search.

c) Meet with the search committee immediately after the search is narrowed to a "short list" and candidates are being invited to campus for interviews. At that time, the affirmative action possibilities should be assessed. The FAAO should review the qualifications of the best minority candidates identified and should seek to determine whether an outstanding woman or minority person has been dropped from the list because of a narrowly defined position. That is, the FAAO should be the affirmative action advocate at this point.

d) Meet with the search committee chairperson immediately after the committee has ranked candidates to assess the appropriateness of the selection procedure and its affirmative action impact.

Validation of Search—When the formal recommendation for appointment is submitted by the department to the dean, it should include a statement by the FAAO that the procedures discussed above were followed and that, in the opinion of the FAAO, the search and selection affirmative action procedures were carried out effectively and with integrity.

Maintenance of Rosters—The FAAO should maintain and update rosters of women and minority scholars identified as potential candidates for faculty positions within the department. The FAAO should also maintain a list of those people in the discipline who tend to know of promising women and minority scholars.

Compilation of Statistics—The FAAO should compile statistics on the hiring and utilization of women and minorities in the department or school. These should be related to national availability data.

Conduit for Information—The FAAO should serve as a conduit for information. It is our expectation that many search committees will have experiences which will influence the actions of other search committees or University policy. The FAAO should be responsible for passing these on to the UCOFAA. Similarly, the FAAO should assure that information or understanding obtained from board meetings is passed on to the department and dean.

Advice to deans and department chairpersons—Heads of departments and schools should consult with their FAAO prior to appointing chairpersons of search committees. FAAO's can provide their perspectives on the levels of sensitivity and consciousness toward affirmative action matters of any particular proposed chairperson.

It is imperative, at least for the short run, that every search conducted in the University be chaired by an individual who recognizes and values the importance of a strong faculty affirmative action thrust. Without commitment at this level, any other action will have limited effect. The chairpersons hold the key to change and, as a consequence, they must be selected with care so that they reflect, to the greatest extent possible, the most concern for affirmative action that we can muster.

Similarly, in recognition of the key role that department chairpersons play in the affirmative action process, we propose that deans consult the FAAO's when appointing new chairpersons. This consultation would enhance the possibility of selecting individuals who would be sensitive to affirmative action issues.

In summary, the duties of the departmental FAAO are several and demanding. If the role is to be performed effectively, the number of departments which the FAAO serves should be limited so that he or she faces a small number of searches each year. The FAAO should be a senior faculty member of considerable influence within these departments. Finally, it is apparent that without strong commitment and considerable relevant sensitivity, it will be impossible for the FAAO to function effectively and achieve the impact we all desire.

Appointments of Administrative Officers

No matter how great the capabilities and organization of the FAAO's, their effectiveness will be limited if they are not supported by department chairs, deans, and other administrators. It is imperative, therefore, that the University inquire carefully about attitudes toward affirmative action as part of every judgment about the quaLifications of a candidate for an administrative post.

It should be unthinkable to appoint as administrator anyone who does not wholeheartedly support the University's aims with regard to affirmative action. Furthermore, the search committee should not simply accept the claims of the candidates, but should look for evidence about what they have actually done in their present positions. A record of success will outweigh many platitudes.

It should be unthinkable to appoint as an administrator anyone who does not wholeheartedly support...affirmative action...A record of success will outweigh many platitudes.

Guidance to Faculty Search Committees

There are a variety of problems faced by many search committees which go beyond the instructions which accompany the faculty recommendation forms. It would be advantageous for the University to learn from its experience in dealing with them and to pass that learning on to new search committees. The best way, of course, would be some brief manual of guidance to the committees maintained and updated by either the Provost or the UCOFAA. In the sections which follow, we present some of the ideas which surfaced at our meetings.

Women and Minority Faculty on Search Committees– When possible, search committees should include women and minority group members. These committee members will frequently enhance the committee's ability to locate and attract minority and women scholars.

Campus Visits by Best Minority and Women Potential Candidates—The department will undoubtedly invite the best minority and women potential candidates to give talks at the University. Prior to the person's arrival, the search committee should consider what Stanford can do for them, in addition to what they can do for Stanford.

The committee should arrange for them to examine the University and the community, to discuss schools, shopping, theater, climate, recreation, etc. Each should have an opportunity to talk with one or more women or minority faculty members about what it might be like for them here.

At the same time, the search committee is likely to recognize other outstanding women and minority scholars during the search process. These scholars should also be invited to speak at departmental seminars.

Such visits will allow our students and faculty to come into contact with some of the best women and minorities in the field. The visits will also help the institution to establish relationships with people who could assist in our affirmative action processes through identification of promising young women and minority scholars and graduate students.

Funds for this purpose should be provided by the Faculty Affirmative Action Fund.

Linking with Women and Minority Networks– Some search committees have indicated informally that they don't know how to link up with the women and minority networks in their fields. Under such circumstances, the best procedure is probably to telephone senior women and minority scholars in the field and seek their advice as to who knows of or keeps track of the most promising young people.

The Dual Career Family—Search committees should recognize that dual career families are becoming increasingly prevalent, particularly among academics and that the University has informal means for attempting to meet the needs of both people. The search committee should, therefore, attempt to determine whether the spouses of its prime candidates will desire employment and work through the dean and provost to assist in the identification of positions. We note that search committees tend to take such a need for granted when their prime candidate is a married woman, but may tend to forget it when the prime candidate is a married man.

Redefinition of Search Goals—It is frequently true that goals of a search will change as candidates are screened and, as a result, the department comes to understand better what talents it might acquire and what are its actual needs. Under such circumstances, the search committee should review the list of candidates dropped from consideration in the initial screening because of mismatches between candidates' interests and the previous perceptions of the search goals.

Identification of Potential Women and Ethnic Minority Faculty

Some of the committee's thoughts on this section of its "charge" are contained in the section concerned with the roles of the faculty affirmative action officers. The committee also felt that the University can learn a great deal from the recruiting practices of some of the major industrial research laboratories such as the Bell Laboratories and the IBM Research Laboratories.

They follow the progress of graduate students at major education institutions from the time that these students initiate research. As a result, they are in a good position to identify outstanding young scientists and engineers, including women and members of ethnic minority groups. While such an undertaking may be beyond our capabilities, less extensive efforts would be helpful.

For example, it would be quite valuable for the provost to maintain a fund to assist faculty members who are concerned with affirmative action to attend appropriate national scholarly meetings for the purpose of identifying potential women and minority faculty. We may anticipate that some of our women and minority faculty will be particularly effective in this role. They should be encouraged to take advantage of this fund.

Similarly, we recommend that our faculty who are giving talks at other institutions have the means to extend their stays so that they can speak with promising graduate students who are close to finishing their Ph.D. theses. In this manner, we might identify outstanding women and minority groups members for our faculty. It is likely that we will, as well, identify "majority" group members who will enrich this institution.

In both cases, the faculty members should return with a list of women and minority graduate students, with addresses, topics of their scholarship, their major professors, people to contact and time of expected readiness for faculty position. This information should be maintained by the department office and by the relevant FAAO. The FAAO should, in turn, present these lists for consideration by each search committee.

The presence of long-term visitors (particularly women and minority visitors) to closely linked institutions like the Center for Advanced Study in the Behavioral Sciences or the National Bureau of Economic Research also offer other opportunities for increasing the effectiveness of our faculty recruiting. These carefully selected scholars are likely to know of outstanding young women and minority scholars. Some may also be potential candidates themselves.

Selection and Recruitment of Women and Ethnic Minorities for the Stanford Professoriate

Included in the committee's charge was the request for recommendations concerning "criteria for selection" of members of the Stanford professoriate. For the most part, these matters are covered by the University's guidelines and by the report of the committee on the professoriate. We urge each search committee member to read the guidelines plus that report at the beginning of a search.

One important consideration in appointing faculty members is an assessment of promising new directions in which research and scholarship may be moving. The history of American academia over the past 150 years illustrates that the quality of such assessments can be a decisive factor in the intellectual standing of a department, a school or a university a decade later. Two obvious examples of this are the responses of institutions to the development of Darwinism and the introduction of solid-state electronics into electrical engineering and computer science.

It is vital that Stanford make such assessments as well in emerging fields in humanities and the social sciences in which gender and racial/ethnic differences have become key categories of analysis. The study of race and gender in history, for example, has moved from the periphery of attention to an important role in understanding the development of society. Such inquiries have attracted many of the most eminent of established historians and the most talented of our graduate students.

Similar perspectives of gender and race have altered other fields in the humanities and the social sciences. Fresh and influential interpretations are emerging, in part, because women and minority scholars have questioned traditional topics and modes of explanation. It is important, therefore, that Stanford make assessments of these emerging fields and implement them effectively.

We note that Stanford has a fairly established pattern for the generation of successful new programs. In general,

continued on next page

Faculty Affirmative Action/continued from page 13

they are started as collaborations by faculty who are strong in their individual disciplines, but who see a mutual intellectual advantage to the formation of an interdisciplinary group. As the group broadens its intellectual goals, new faculty are drawn into it.

At some point in this process, a dean or the provost makes a decision that faculty will be hired to further strengthen the endeavor. This may occur before or after the formal formation of a "program." In either case, the University has a department perform a search, in collaboration with the program, for an outstanding person within the discipline who will also strengthen the program. Occasionally, the appointment is joint between the department and the program. If this process continues, the endeavor may become a department. More often, it is appropriate to maintain it as an interdisciplinary program.

We believe this process, which appears to have evolved naturally, is a wise one. The departmental search tends to maintain the quality of the faculty involved. The choice of extremely good people tends, over the long run, to strengthen the interdisciplinary endeavor, even if the match is not ideal for the latter at the time the choice is made. Finally, the department develops a stake in the endeavor.

The various formal and informal grouping of scholars studying women and minorities are in differing stages of this general evolution. We have one formal program, the African and Afro-American Studies Program, and two research centers, the Center for Research on Women (CROW) and the Center for Chicano Research.

Other research and teaching collaborations abound in the institution. We believe that department and deans could make a very important contribution to faculty affirmative action by sitting down once or twice a year with relevant members of the faculty studying women and minorities to address the following questions:

1) Are there emerging scholarly activities related to women and minorities which are likely to have a significant intellectual impact, both within and outside existing departments, and which could be successful here at Stanford?

2) Are there outstanding or potentially outstanding people in these areas that might be brought to the Stanford faculty?

3) Are there outstanding or potentially outstanding people that might be brought to Stanford to strengthen the existing departments, programs, centers and collaborations discussed above?

After saying this, however, we must reiterate our belief that the University's goal of increasing the number of women and minority faculty throughout the institution is a wise one. Certainly, affirmative action should not be limited to the situations described above.

Retention and promotion of Women and Ethnic Minorities in the Stanford Professoriate

The most important statement that the Committee can present concerning the retention and promotion of women and ethnic minorities in the Stanford Professoriate is that these faculty members usually face many more demands upon their time than do most of our junior faculty.

Because of their small numbers at the University, compared to the large numbers of women and minority students, these faculty are asked to advise and assist on a scale that goes far beyond normal departmental advising, to be members of more committees than their majority colleagues and to meet with local and national minority groups.

At the same time, they must be faculty (in the teaching, advising and thesis supervision roles) for the majority students as well. Too often, they face the dilemma of attempting to meet these extensive but quite legitimate general University needs while also meeting important personal needs for development as scholars. In the long run, their contributions to the University depend on both being done effectively.

We believe, therefore, that the University should reinstitute the Junior Leave Program to allow junior faculty facing such special demands to also have time to develop their scholarly careers. Our examination of that program indicates that it was of considerable importance in providing opportunities for some of our most talented women and minority faculty to achieve their scholarly potentials, and that it made substantial contributions to the ranks of our tenured women and minority faculty.

Procedures for Advising and Aiding Women and Ethnic Minority Faculty Members

Because of the unusual, above-described responsibilities of women and ethnic minority faculty, the junior faculty members are particularly in need of mentering and monitoring by senior faculty. Too often, minority faculty must choose between perceived general University responsibilities and responsibilities for personal scholarly development.

It is extremely important that a sympathetic but demanding senior faculty member keep track of each junior faculty member's progress and provide informed advice. That faculty member should also assist the junior faculty member in the various activities associated with obtaining research grants.

All too often, graduate students do not learn of these activities prior to taking an academic position. It is to the faculty member's and the institution's advantage that they be taught. This direct relationship should be a supplement to information provided at meetings each autumn of the deans with their new junior faculty.

It is also important that department heads provide meaningful and carefully considered annual conferences, as recommended by the Committee on the Professoriate and by the Academic Senate. Too often, we have heard, these conferences do not take place or are superficial. These conferences are extremely important feedback to all junior faculty, but are particularly important to those women and minority faculty who are attempting to balance University service with teaching and research. The department head or designate should review the faculty member's teaching and research. The results should be discussed at a meeting of the senior faculty prior to the conference. It would probably be most helpful to all our junior faculty if one meeting of the senior faculty each year was devoted to a review of the performance of the junior faculty.

The Faculty Affirmative Action Fund

If the University is vigorous in its search for women and minority candidates for its regular positions and in its evaluations of academic opportunities, as discussed in the preceding paragraphs, it is bound to identify outstanding people who would add significantly to our academic programs, but who do not fill an existing billet.

It is essential that the Faculty Affirmative Action Fund be maintained so that we can respond in such circumstances. The small numbers of black and chicano graduate students in all fields, and the small number of women graduate students in many fields, imply that progress in increasing the numbers of these minority and women faculty will be slow, indeed, if our hiring of them is determined alone by the matching of existing positions with the best people.

Each truly outstanding person should be recognized as an important opportunity in itself. Only if the fund is maintained can this be done with a view toward an appointment being made.

Arthur I. Bienenstock, chairman professor, school of humanities and sciences; Barbara Babcock, professor, school of law; Cecilia P. Burciaga, ex officio, assistant provost; William R. Evitt, professor, school of earth sciences; Dora B. Goldstein, professor, school of medicine; Arturo Islas, associate professor, school of humanities and sciences; James G. March, professor, school of education (resigned from committee); Diane W. Middlebrook, associate professor, school of humanities and sciences; Susan S. Owicki, associate professor, school of engineering; Jerry I. Porras, associate professor, graduate school of business; two students: John Trasvina, Law school; Kendyll Stansbury, School of Education; Edgar O. Yhap, School of Medicine.

Student complaints about teaching, courses have declined, Goheen reports

continued from page 1

admissable in a court of law, to permit a reasonable conclusion that monitoring occurred."

In 1976, a university investigator at MIT reported there were "indications that the Republic of China. . .may operate a nationwide surveillance system to keep tab on Taiwanese students in the U.S."

National problem

Local and campus newspapers at the University of Minnesota, University of Wisconsin, Cornell, State University of New York, University of Chicago, and Iowa State University have reported similar activity in their communities, *The Independent* said.

Soon after its publication, Goheen said, "several Taiwanese students came to denounce these charges and to seek advice on how to counter what they claimed to be a false accusation, both with regard to their own conduct and that of the Taiwan government." While their request initially seemed reasonable, Goheen's investigation basically sustained the newspaper's account.

On other matters, Goheen said there was a decline in the total number of cases brought to the office, from 677 in 1980-81 to 555 last year. But the number of groups presenting a common problem or complaint increased.

The number of student complaints about teaching and course organization dropped (from 39 to 20), as did the number of complaints about grading (from 49 to 34). This probably reflects changes and improvements in courses where complaints about teaching have been common, such as chemistry and mathematics.

Two specific "problem areas" that need "serious attention" are the master's degree programs in broadcast journalism and print journalism, which have been "severely criticized" by participating students, Goheen said.

Behind this criticism is the need for greater financial support for both programs. "Current departmental concern with these problems is reassuring," he added.

The number of Honor Code problems brought to this office "continues to be high," totalling 70 in 1980-81 and 63 last year. Most concern students charged with a violation and those who suspect others of cheating.

Among academic staff members, there was "a considerable number" of difficulties expressed by lecturers in French and Italian concerning their status and and teaching conditions. Improved communication by the department head with the lecturers and the ceding of greater control of language teaching to the lecturers themselves "promise a resolution of these problems," Goheen said.

Library staffers

Some library staff members "have had difficulties that appear to derive from arbitrary decisions, lack of consultation and an insensitive disregard of their knowledge as experienced professional librarians," he added. "The administration is aware of these problems. There is, at least, hope of improvement."

The number of problems and complaints by non-academic staff "remains high," even though the total declined from 81 to 62. These problems are "extremely varied," but generally reflect discontent about job-related matters.

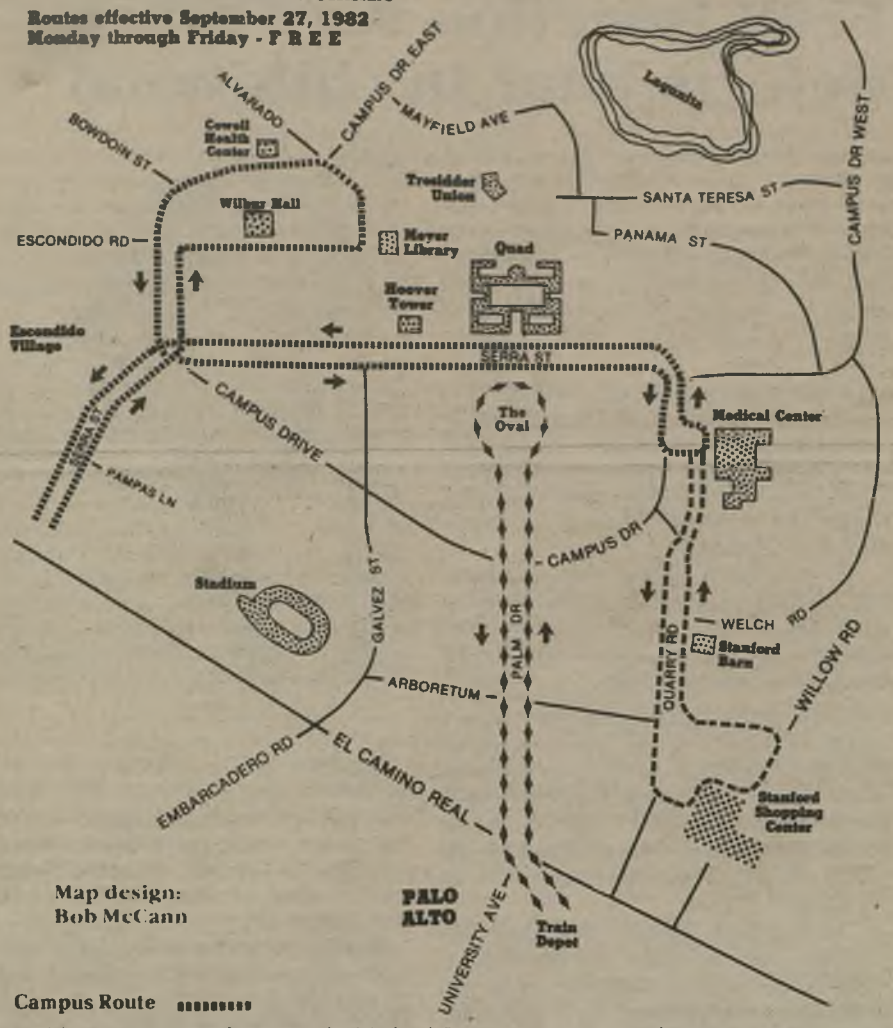
Goheen's office is responsible for helping resolve problems of sexual harassment on an informal basis. All eight cases brought to the office last year "appear to be resolved, which suggests that an informal procedure is effective and preferable to the formal procedure" provided in the University's official policy on sexual harassment.

Student volunteers now are working with the office, faculty, and student affairs staff members on a draft statement of student rights and responsibilities, bringing together a brief summary of information now scattered in several university publications.

Goheen, an emeritus professor of philosophy, describes the function of his office as trying "to analyze problems in terms of fairness and justice. . .an exercise in practical ethics."

Many issues requiring thought and analysis are thoroughly discussed with his colleagues, Allen Barbour, Linda Northway, Leah Kaplan, and Sarah Stephenson.

DOE extends SLAC contract



A five-year extension of its contract with Stanford University—for the operation of the Stanford Linear Accelerator Center—was announced Friday, Oct. 1, by the San Francisco Operations Office of the U.S. Department of Energy.

The contract provides a budget, at about a $100 million annually, for continuation of basic research programs at the Laboratory in elementary particle physics.

The current contract ended Sept. 30.

The research program at SLAC, directed from its inception by Wolfgang K. H. Panofsky, has been funded by the federal government since 1962.

Marguerite Shuttle routes changed

Campus Route ▪▪▪▪▪▪▪▪

The campus route begins at the Medical Center at 7:25 a.m. and runs every 10 minutes until 5:15 p.m. The route follows Serra Street directly to Escondido Village and returns, including a loop on Campus Drive to Escondido Road for access to Meyer Library and the Law School, then back to Campus Drive at Cowell Health Center.

Shopping Center ▬▬▬▬

The shopping center route begins at 11:30 a.m. and runs every 10 minutes until 1:40 p.m. The route is the same as the campus route, except that on the return to the Medical Center, it continues on to the Shopping Center via Quarry Road and returns via Willow to Arboretum to Quarry Road.

Train Depot ◆◆◆

The train depot route runs from 6:05 a.m. to 9:37 a.m. and 3:08 p.m. to 6:22 p.m.

In the morning the bus boards on the northbound side of the train depot. The route is a continuous circle from the train depot to the Oval. Passengers may transfer at the Oval to the Campus Route. This schedule coincides with the incoming trains.

In the evening the bus stops on the southbound side of the train depot. Wheelchair lifts are available.

For further information call The Housing Programs Office at 497-3027.

Personnel update

Life insurance forms needed soon

Jeannie Thomas, the University's manager of benefits and records, advises that the last three open meetings for the new life insurance plan will be held this week. The schedule of meetings is as follows:

Wednesday, Oct. 6, 9-10 a.m. in CERAS 112, and 2-3 p.m. in Fairchild Auditorium; Thursday, Oct. 7, 9:30-10:30 a.m. in SLAC Auditorium.

Thomas reports that although the employee response to the new plan has been positive and many enrollment forms have been completed and returned, many more need to be received by November 10 (the last day of the enrollment period).

Employees are encouraged to complete their enrollment forms as soon as possible and forward them to the life insurance center at the Office of Benefits and Records located in the Old Pavilion. (Employees located at SLAC should return completed enrollment forms to the Benefits Office at SLAC.)

Thomas once again encourages employees who have questions about the new life insurance plan to call the life insurance center at 7-0757 between the hours of 9 a.m. and 4:30 p.m., including the lunch hour. Also, employees may come by the life insurance center located in the Old Pavilion during the same hours.

350 CONTEXT users face computer withdrawal pangs

Stanford will phase out Context, a campus-wide DEC-2060 computer text editing system, by Dec. 1.

Finding suitable alternatives for more than 350 users of the advanced scholarly writing system will be the top priority of the Center for Information Technology, according to CIT Director Edward Shaw.

The Center hopes to accommodate the handful of full-time Context staff members through existing vacancies and normal turnover, according to Deputy Director Mike Roberts.

"We've heard nothing but appreciation and enthusiasm for the hard work of Context staff members," he said.

Rapidly changing technology, including strong competition from new generation microcomputers, and continued economic constraints, both nationally and within the University, led to the decision, Roberts said.

"Context was not started as a service to replace an existing function. It was new from the ground up, entirely dependent on faculty decisions to allocate discretionary resources for its support.

"Context began just as the economic recession hit the University hard. Many faculty making decisions at the margin said 'gee, this looks nice' but faced very strong competing demands for resources.

"The economic signals that caused this decision were very evident in June, but the enormous effort and dedication of staffers and the hope for a turnaround resulted in delay. In the last 90 days, income has been less than half our projected target."

The phaseout will cut a projected deficit of $200,000 to $500,000, Roberts said. Approximately $250,000 in startup expenses will not be recovered.

"With the increasingly difficult financial condition of the University in general, it simply is not possible to allocate the several hundreds of thousands of dollars necessary to retain the service," Shaw said.

The University now plans to sell the DEC-2060.

Some current Context users may go to personal computers. Others may try VAX machines or other DEC-2060s on campus. Some may switch to the IBM 3081 at CIT

Users already have received a previously published CIT booklet, *Evaluating Your Text-Handling Alternatives* and soon will receive a questionnaire concerning their needs.

Four meetings have been scheduled at Turing Auditorium (Polya Hall, Room 111), starting at noon Friday, Oct. 8, with a general question and answer session. Text processing alternatives on the 3081 will be discussed starting at 10 a.m. Tuesday, Oct. 12; Commercial Word Processors and Office Information Systems at 10 a.m. Thursday, Oct. 14; personal computers at 10 a.m. Thursday, Oct. 21; and special needs of TEX users at a date to be announced.

Written summaries of these sessions will be available at the Context office, 115 Pine Hall (Ext. 7-4376).

Our campus would look so much better if ALL OF US WOULD PICK UP LITTER.

Many hands make light work.

Peter Coutts lottery set Nov. 1; applications deadline is Oct. 29

Twelve condominium units at Peter Coutts Hill will be made available for purchase to all active members of Eligibility Pool 1 who already own homes within a 15-mile radius of Hoover Tower. Retired individuals are, however, not eligible to purchase units at this time.

Units will be assigned through a lottery drawing. Applications for the lottery are available at the Housing Programs Office in 105 Encina Hall. Deadline for application is 5 p.m. Friday, October 29. Lottery results will be announced on Monday, November 1.

Applicants should understand that, if they are assigned a unit, they will be required to make an immediate $1,000 reservation deposit. Further, an additional sum equal to two percent (2%) of the purchase price of their unit less $1,000 will be due and payable 45 days prior to close of escrow. Escrow must close within 30 days following completion of construction of the assigned unit. Since all units are expected to be completed by the end of April, 1983, only those individuals who would be able to complete the purchase by the end of May, 1983, should apply.

All units at Peter Coutts Hill must be owner-occupied, and may not be purchased for investment purposes.

University policy prohibits individuals from owning more than one residence on the campus at any time. Those who already own campus residences will be required to sell their present homes before purchasing at Peter Coutts Hill. No bridge financing will be available from the University.

Individuals with questions concerning their eligibility to purchase an on-campus residence, prices and financing for Peter Coutts Hill units, or their ability to afford the units should make an appointment to see Robin Hamill, director of housing programs, by phoning 497-1964.

Those desiring to tour the units should make an appointment with Barbara Rockwell, sales manager of Peter Coutts Hill, at 497-3649.

S*M*A*S*Hing lectures open new series this week

This fall's lecture lineup marks the beginning of a new S*M*A*S*H series at the Stanford School of Medicine.

The series—whose full name is "Stanford Medical and Scientific Highlights"—was initiated in 1980 by the Medical School's faculty senate, which now cosponsors it with the Stanford Medical Students Association.

The organizing committee hopes to encourage a wide exchange of ideas, and to provide a forum by which the Medical Center community may be informed of significant medical research and developments at Stanford.

Given by both faculty members and students, the Friday presentations are geared towards all those with basic scientific understanding.

This season's lectures are as follows:

• Oct. 8: "The Biochemistry of Mental Illness (Do Twisted Molecules yield Twisted Thoughts?)"—Dr. Philip Berger, associate professor of psychiatry and director of the Mental Health Clinical Research Center;

• Oct. 22: "Cellular Neurobiology of Mental Retardation"—Dr. Dominick Purpura, dean of the School of Medicine and associate vice president for medical affairs;

• Nov. 5: "Transplantation of Islets of Langerhans"—Dr. Ronald Merrell, assistant professor of surgery;

• Nov. 19: "Experimental tests of the Prediction of Protein Folding"—Dr. Robert Baldwin, professor of biochemistry, and Peter Kim, a fourth-year student in the Medical Scientist Training Program.

All presentations will take place at 4:30 p.m. in Fairchild Auditorium, with TGIF gatherings afterwards in the lobby.

Symposium to focus on infancy

"Infancy: New Research and Clinical Implications" is the theme of the second annual symposium on Advances in Developmental Knowledge to be held at the School of Medicine Nov. 13 and 14.

Key-note speaker for the symposium will be Dr. Daniel Stern, from the Cornell Medical Center and the Columbia University Center for Psychoanalytic Training and Research.

Major presentations will be made by Dr. Thomas Anders, head of Stanford's division of child psychiatry, Dr. Anneliese Korner, research psychologist, and Isabel Paret, child analyst.

To be held in the Fairchild Auditorium at Stanford, the symposium will consider the research and clinical aspects of biological and psychological development in early infancy. Scientific papers and discussions will address both normal development and the possible pathologies arising from this period. Small discussion groups will be held as part of the program.

Included among the participants will be Dr. Jeree Pawl, from the Frailberg Project at San Francisco General Hospital, and child analysts Drs. Joseph Afterman, Philip Spielman, and Calvin Settlage. Professor Colin Pittendrigh of the Hopkins Marine Station, an authority on biological rhythms, will also be present.

The symposium is sponsored by Stanford's division of child psychiatry, Children's Hospital at Stanford, and the extension division of the San Francisco Psychoanalytic Institute. It is intended for researchers, clinicians, mental health professionals, nurses, pediatricians and academicians.

Early enrollment is recommended. The registration fees will include a box lunch and reception Saturday afternoon. For program and registration information, call 563-5815.

Fetal infection may cause defects later in childhood

An infection acquired during pregnancy that is responsible for more birth defects than herpes, rubella and syphilis combined may be even more common and insidious than researchers first thought, according to studies by scientists at the Palo Alto Medical Research Foundation and Stanford Medical School.

Toxoplasmosis, a disease triggered by a parasite that passes across the placenta to cause blindness, deafness or mental retardation in more than 3500 developing fetuses in the United States each year, may lie dormant in some children, according to Dr. Jack S. Remington.

These children appear normal at birth but as many as 90 percent will develop symptoms of the disease in their first decade of life, he said. Yet the disease, he emphasized, is preventable.

Jack Remington

Remington, chairman of the department of immunology and infectious diseases at the Foundation and professor of medicine at Stanford University, will present his findings at a world conference on the "Prevention of Physical and Mental Congenital Defects," October 10-16 in Strasbourg, France.

"Most people thought that these apparently normal babies (whose mothers contracted the infection late in pregnancy) were normal the rest of their lives," Remington said.

"Now we know that there may be a long latent period before the disease becomes apparent. Thus, there is a tremendous iceberg beneath the surface. If we could detect these babies early enough, there is some evidence to suggest that treatment early in life could prevent the damage that otherwise follows."

Parasite abounds

Nearly 50 percent of U.S. residents are chronically infected with the parasite *Toxoplasma gondii*, Remington said, though only a fraction of those suffer serious symptoms from their infection. Women who harbor the organism before they become pregnant (approximately one-fourth of all women of child-bearing age) pose no danger to their unborn child.

But when a woman contracts the disease during her pregnancy, her child stands a 45 percent chance of acquiring an infection that can cause significant damage to vital organ systems, Remington said.

Currently no vaccine exists to inoculate women against the disease, though a simple blood test can detect the infection. While some countries require that blood tests for the infection be performed at least once during each trimester of pregnancy, most American women—and many of their physicians—don't even know the disease exists, Remington said.

"The message is that this is a major, preventable disease that is not appropriately appreciated by the public at large," Remington said. "You can't find a woman in Paris who doesn't know what toxoplasmosis is, but physicians in this country are not informing their patients. Women here don't even know about it so they can't prevent it."

Undercooked meat, unwashed vegetables, and cat feces are common transmitters of the parasite. If women take a few simple precautions while they are pregnant, they can greatly reduce their chances of acquiring the infection, Remington said.

Such precautions include avoiding raw and rare meat by smoke-curing or cooking above 151 degrees Fahrenheit, washing hands after handling raw meat or unwashed vegetables, avoiding contact with stray cats, letting someone else change the cat litter, and wearing gloves while gardening or working in the soil.

If a pregnant woman contracts the infection, she has several options which she should discuss with her doctor, Remington said, depending on the seriousness of her infection. The choices include antibiotic therapy, therapeutic abortion, or risking infection of the fetus.

Results are still not in from all the international studies following children whose mothers were exposed to the parasite late in pregnancy, Remington said, but preliminary data indicate that such children who are identified and treated with antibiotics in the months after birth fare better than untreated children.

"We know that in animal models, (the drugs given after birth) will eradicate the destructive form of the organism and cure the disease," said Remington.

"The important point that I wish to emphasize is that this is a preventable infection and a treatable infection," he said, suggesting that pregnant women insist upon the blood test and get additional information about the disease from their doctors.

—Deborah Franklin

Wrong bell rang!

In the Sept. 22 issue of the *Medical Center Memo*, Donald B. Tower's phone number was incorrectly listed. His actual number is 497-6641.

We regret the error and any inconveniences it may have caused.

Ombudsperson urges action on expressed concerns

Formal grievances represent only "the tip of an iceberg" of problems requiring solution at the Medical School, stated a report released recently by the Associate University Ombudsperson.

The report focused critically on problems between the relationship of medical students and faculty, and the oftentimes conflicting demands of patient care and scientific achievement.

The document noted that while "major strategic resolutions" are needed to solve some problems involving such areas as faculty-student relations, staff personnel and academic scheduling, other problems may be solved more easily by providing basic information to settle misunderstandings quickly.

The nine-page report comes one year after Allen B. Barbour, professor of clinical medicine emeritus, was appointed to the newly created post of associate University ombudsperson. (See full text of the report on page 23.)

His jurisdiction is Medical School faculty and staff, medical and other graduate students, as well as house staff and postdoctoral fellows.

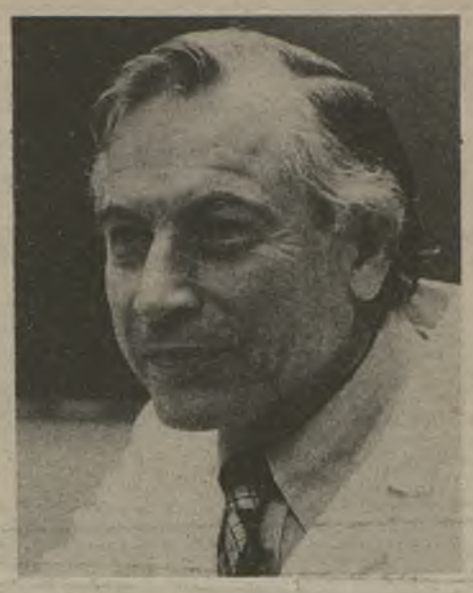
Seventy formal grievances from all segments of the Medical School community were presented during the year, and more than half—37—came from medical students. The problems facing that student group drew perhaps the strongest words in the report.

Barbour noted that the 86 students selected from an applicant pool of 4,800 "are then treated too often like children."

"The students describe a pervasive anxiety and bewilderment about the difficulties of preserving their human values in a competitive intellectual environment," the report said.

Among problems cited was "the use of intellectual one-upmanship and exposure of students' ignorance as learning incentives as opposed to positive help with the learning process, esoterica at the expense of common sense and basic approaches, (and) science and disease model of illness without sufficient attention to a psychosocial understanding of the human needs of patients. . . ."

Barbour said a "shift in emphasis along these lines would go a long way toward restoring a more positive and joyous attitude of students toward medicine in general and their education in particular."



"The solution to the basic problem of student alienation lies with the rank and file faculty as learning facilitators, role models, colleagues and friends of students," the report said, noting that dialogue between students, senior faculty and administration has helped ease some of the tension.

The Committee on Student Performance (CSP), which reviews unsatisfactory performances by medical students, drew criticism in the report.

About one-third of all medical students face the CSP at least once during their career, and the body is viewed by students "as more disciplinary than helpful."

"Why should one of the finest medical student bodies on earth have such an inordinate number of failures? The system is obviously failing, but the students get the F's," the report stated.

Barbour said a gap exists between some students' bias toward a clinical education and many faculty members' emphasis on research, and this leads to "discordance between student selection and faculty expectations."

Allen Barbour

Barbour said the institution's present research emphasis should be retained. "But there needs to be a somewhat better balance between student needs for medical practice and course content along with a more extensive support and counseling program to help students in the learning process."

In a specific area, Barbour recommended that more courses be taught in the summer to avoid schedule jamming during other quarters and to avoid wasting student time and money during the slow summer.

The faculty, Barbour said, can be frustrated by a heavy emphasis on research over teaching and patient care when evaluating tenure appointments. In addition, faculty members "are frustrated by pressures to produce Faculty Practice Plan (FPP) income at the expense of research and teaching, coupled with major FPP financial losses from an inadequate billing system and Medi-Cal restrictions," the report noted.

Staff members, including supervisors, are often unaware of University personnel policy despite "a truly excellent Human Resources Group headed by Rosemary Hornby. . .who should be consulted for advice early and much more often during the incipient stage of personnel problems."

A major problem, Barbour said, is a tendency of supervisors to wait until an imminent firing before warning an employee of unsatisfactory performance. This has left many workers needlessly confused, angry and without adequate understanding of their work deficiencies, he said.

Four formal grievances were filed with the ombudsman by non-academic staff during the year.

Other areas of concern include the approximately 400 medical post-doctoral fellows who fit in no easily definable group and have a wide spectrum of administrative difficulties, Barbour said.

The house staff, Barbour said, would benefit from more feedback from their departmental leadership, but "by and large, the house staff brings few grievances to this office," the report said.

Barbour credited chief of staff James Silverman and house staff office director Helen Rantz for providing responsive leadership and active support.

Relaxation therapy for high blood pressure gets boost

Studies over the past few years have shown that muscle relaxation training can, at least for a period of time, successfully supplement medical treatment of high blood pressure.

A new set of findings at Stanford has led researchers to believe that patients' *expectations* influence the outcome of this therapy.

Hypertensive patients randomly assigned to two groups received three relaxation training sessions. Half were told to expect blood pressure lowering immediately; the other half were told that benefits would come gradually, after the first three sessions.

Dr. W. Stewart Agras, professor of psychiatry, reported in the Sept. 27 issue of *Psychosomatic Medicine:* "Participants given the expectation that the blood pressure lowering effects of relaxation would be delayed showed significantly less (initial) reduction in. . .blood pressure than those who were told that relaxation would produce an immediate effect."

Moreover, Agras concluded that cognitive processes have an "obscure" power to promote, or interfere with, relaxation techniques for hypertensives.

These techniques, which require mental focusing, are taught to about ten patients sitting quietly in a group. They breathe deeply and slowly, sequentially tensing and relaxing all the major muscle groups of the body, while imagining pleasant scenes.

"It's amazing to me," said Agras, "how many people are not used to relaxing. I hear people say they've never felt like that before!"

W. Stewart Agras

The major predisposing factors for high blood pressure, he explained, are heredity and overweight. "But now, chronic stress is also widely suspected as a contributing factor."

Agras said that the main dangers associated with high blood pressure are increased risks of stroke, heart attacks, and heart failure.

He recommends the relaxation procedure as an adjunctive method of treatment for hypertensives who respond poorly to pharmacological treatment. "But relaxation is not a replacement treatment," he emphasized. "Medication is still a must for most hypertensive patients."

Training in muscular relaxation, Agras said, usually takes about eight separate hour-long group sessions. Patients also practice at home for about 15 minutes a day, five days a week, with the help of therapist-prepared audiotapes.

Participants, he added, are taught to detect their tension levels during the work day, and eventually can bring on relaxation instantaneously.

The effects of relaxation training on hypertensives were first observed by researchers as far back as 50 years ago, Agras explained.

"Perhaps due to the discovery of effective pharmacological measures to reduce blood pressure, this method was largely ignored until the mid-60's when reports of the effects of meditation and biofeedback rekindled interest in the psychological treatment of hypertension."

In studies since then, relaxation training has been proven superior to placebo procedures in working with medication to help reduce high blood pressure. (Relaxation effects have not yet been directly compared to those of salt restriction, weight loss or exercise.)

"At Stanford we've been researching relaxation's effects on blood pressure since about 1975," Agras said. Once convinced of the training's immediate benefits, Agras and his team went on to demonstrate that they last around the clock, even under stressful work environments.

In Stanford's longest published follow-up study so far, Agras and his associates found that the blood pressure lowering effects of relaxation therapy on hypertensives persist for at least six months after the initial training series.

"These were people who continued practicing three to five times a week with audiotapes, and whom we met with monthly to retrain," he said.

Beyond that period, however, the effects remain to be seen. "Whether relaxation therapy affords long-term benefits is now the big question," Agras added.

Researchers also want to determine who benefits the most from the treatment. Agras suspects that those with hypertension most out of control or who've had the condition a long time will reap the most, with borderline patients benefiting little.

Besides helping to lower blood pressure, relaxation training has been found to effect dramatic drops in anxiety, depression, and "high-strung" behavior. Other investigators, Agras said, have discovered that relaxation therapy reduces insomnia and the pain of tension headaches. "So we're seeing the beginnings of a general stress reduction approach," he said.

"Although relaxation training is not yet an established form of treatment, it's to the point where there's enough evidence—at least of its adjunctive merit—that we're beginning to see its applications," he added.

Agras' study on expectation and the blood pressure lowering effects of relaxation was supported in part by a grant from the National Institutes of Health.

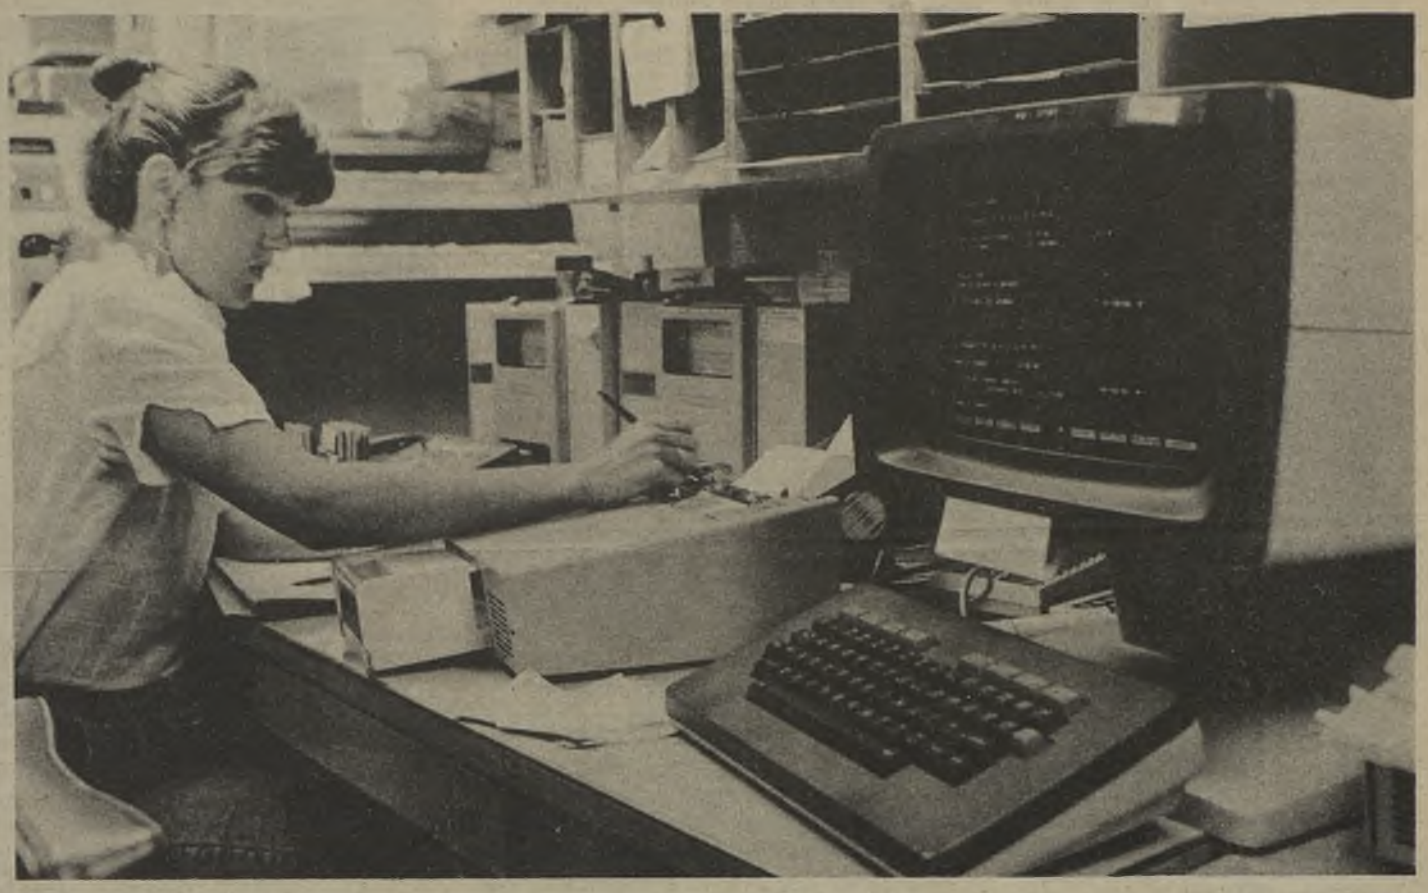
Computer comes to rescue of medical record keeping

A mound of 750,000 index cards was one of the first challenges facing SUH after the Board of Hospital Directors approved a Medical Information System (MIS) last June.

Ultimately, MIS will make sweeping changes in the way patient treatment data are handled throughout the Hospital, said Lee Cort, director of the MIS program.

Physicians and other medical personnel, working in front of one of many video display terminals to be installed during the next three years throughout the Hospital, will be able to review test results and other information commonly contained on patient charts.



Doctors then will be able to enter their instructions for patient treatment by pointing a light pen at data elements displayed on the screen. That information will be available to nurses or other patient treatment personnel in the form of medication schedules, service requisitions, patient treatment profiles, and more.

As an added safety feature, the system will provide reminders if medications are not given on schedule.

Capital costs for the system, Cort said, are about $3.5 million. Most of the cost, he added, will be offset by increased efficiency.

The first step, Cort noted, will become fully operational in October and involves computerizing the mini-histories of each of the 750,000 patients who have visited SUH or the Clinics since the Medical Center moved to Palo Alto from San Francisco in 1959.

"What we are accomplishing," said Carole Price, SUH associate administrator, "is to weave together state-of-the-art computer technology with the continuous need for medical record keeping. We blended the skills and effort of persons from Hospital Administration and Medical Records, as well as a variety of highly skilled persons from the Center for Information Technology (CIT) on main campus, who worked closely as a team."

Computer terminals are replacing slower, less efficient methods of transmitting identification information between patient entry points and Medical Records. Using the new system is Kathy McGovern, lead clerk.

The task at hand

Whenever a patient shows up at Hospital Admitting, the Emergency Room, or the Clinics, the staff are faced with the task of determining whether he or she had visited Stanford before, and if so, matching the patient with his or her number so that a patient record or chart can be pulled from storage.

Marion O'Brien-Adineh, director of Medical Records, explained how the old system works:

"After the patient arrives at Admitting, the Clinics or the Emergency Room, he or she is asked basic questions. We then need to look up or at least verify the patient I.D. number.

"The patient's name and other identifying facts are transmitted by the Admitting personnel via a writing transmitter to the Medical Records office. Then the clerk who receives the information here must often wait for a turn at the revolving index file which contains the 750,000 index cards.

"Physically the cabinet containing the revolving trays is so limited that we cannot have more than two people looking up information no matter how busy we are.

"Considering that we can have several hundred people an hour arriving here, we can be pretty busy.

"Sometimes the patient's number and master index card are found quickly, but often the clerk must do some detective work.

"The patient may have forgotten she was here before under her maiden name. Other times an address is wrong, and we have to send a message back to verify with the patient whether he or she lived at a certain address before.

"Or more urgently, someone may have arrived in the Emergency Room unconscious and may not be able to communicate. Treatment begins immediately, but sometimes there is vital information contained on the chart, so it becomes crucial to locate the record as quickly as possible.

"Eventually we will find the number, and we transmit the information back. Then we go and pull the patient's file and send it to the unit.

"A typical wait is about a half hour."

With the new computerized system, personnel in Admitting, the Emergency Room, or the Clinics will be able to call up on their screen a name or several names of similar spelling and verify the patient number on the spot. In the initial installation phase already in use and expected to be fully operational this month, the Medical Records clerk enters the patient's name into the terminal, which immediately responds with the patient number.

Officials estimate that the average wait before a patient's file can be pulled will be reduced to one-third of the work time presently required. Making the switch from paper to computer involved a lot of work, Cort said. The information contained on all 750,000 cards had to be microfilmed and then transferred by keypunch operators onto tapes. That job took three months.

Advantages undoubted

Efficiency is cited as a key benefit of the master patient index, according to O'Brien-Adineh.

"A positive benefit of this system is the improved morale we've experienced here, beyond the novelty of learning a new system which many of our people find enjoyable to operate. Many of our clerks had been frustrated with the previous system, and I think they feel good just knowing something has been done, some attention has been paid to them and their function."

O'Brien-Adineh pulls a medical chart. The new system will not eliminate the need for written records, though much of the data will be available via computer during a patient's Hospital stay or clinic visit.

Instrumental in developing the master patient index were Lynn Schatek, the University's manager of medical information systems for the CIT, and Paul Irwin, the programmer/analyst whom Schatek assigned to develop the index. Cort has overall responsibility for developing computer applications for use in the Hospital, while O'Brien-Adineh is in charge of implementing the finished product in her own area. She reports to Price.

"One of the most satisfying results of this project is that we brought it in faster than expected—three months instead of six—and for about $60,000 instead of the $100,000 originally budgeted. This was accomplished by the teamwork shown by a variety of Hospital and University people from widely differing areas," Price said.

Medical Center Calendar

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

WEDNESDAY, October 6

Dept. of Genetics: "Repressor Structure and the Mechanism of Positive Gene Control"—Dr. Mark Ptashne (Harvard). 4 p.m., M104.

Div. of Orthopedic Surgery Grand Rounds: "Articular Cartilage and Embryology of Musculoskeletal System"—Drs. David Schurman and Lane Smith. 7:30 a.m., M114.

Div. of Orthopedic Surgery Grand Rounds: "Continuous Passive Motion"—Dr. R. Coutt (UCSD). 8:30 a.m., M114.

Dept. of Neurology Grand Rounds: "Nuclear Magnetic Resonance Imaging in the CNS. Comparison with CT Scanning"—Dr. Michael Brant-Zawadski (UCSF). 5 p.m., C364.

Nursing Educational Services: "Basic EKG Interpretation Workshop." Enrollment limited to 20. Fee required. Continuing education credit available. 7 till 9 p.m., W005. For further information, call 497-6366.

Dept. of Structural Biology: "Structure of Membrane-Bound Cytochrome C Oxidase by Electron Microscopy of Vesicle Crystals"—Dr. James Deatherage (Cambridge). Noon, Fairchild Bldg., D102.

THURSDAY, OCTOBER 7

Dept. of Medicine Grand Rounds: "Acute Myelogenous Leukemia—Analysis of Recent Therapy"—Dr. Peter Greenberg. 8:30 a.m., Fairchild Auditorium.

Dept. of Pharmacology: "Regulation of Calmodulin in Animal Cells"—Dr. Anthony Means (Baylor). 4:15 p.m., R358 library.

Div. of Otolaryngology/Head and Neck Surgery Grand Rounds: "Uncommon Infections in the Head and Neck"—Drs. Lee Smith, Judith Green, Steve Denenberg and Clough Shelton. 6 p.m., Wang Library R117.

FRIDAY, OCTOBER 8

First SMASH Lecture of Autumn, 1982: "The Biochemistry of Mental Illness (Do Twisted Molecules Yield Twisted Thoughts?)"—Dr. Philip Berger. 4:30 p.m., Fairchild Auditorium.

Dept. of Pediatrics Grand Rounds: "Clinical Review of Near-Miss Sudden Infant Death Syndrome"—Dr. Ronald Ariagno. 8 a.m., M106.

Nursing Educational Services: "The Law and Nursing Practice." 8:30 a.m. till 4:30 p.m., Sweeney Hall 120, San Jose State Univ. For further information, call Hedy Dumpel, R.N., J.D., at 497-5981.

Dept. of Gynecology and Obstetrics Grand Rounds: "Calcium Blockers"—Dr. John Schroeder. 8 a.m., A336.

Div. of Child Psychiatry Grand Rounds: "A Psychological Approach to the Ontogeny of Coping"—Dr. Seymour Levine. 11 a.m., Faber Auditorium, Children's Hospital at Stanford.

SATURDAY, OCTOBER 9

Dept. of Hematology, Stanford-UCSF Combined Grand Rounds: Three cases, research presentation. Lunch will be served. 9:30 a.m., M110. For further information, call Lynda Spencer at 497-5007.

Calendar items must be received in the Office of Public Events, 800 Welch Road, Suite 221, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Ross makes "rounds" in the intensive care nursery.

Bill Ross: troubleshooter, manager, man behind scenes

When a call summons Stanford's emergency critical care transport team to pick up a seriously ill infant 500 miles away, there is little time to fix a broken isolette or gather together the medications that might be needed.

The best skills of highly trained physicians, nurses and therapists on the transport team are useless if equipment and medical supplies aren't well stocked and ready to move at a moment's notice.

Bill Ross, regional operations manager for the nursing units that deal with the care of newborns, as well as for critical care transport, orchestrates the preventive maintenance necessary to keep his units running smoothly.

Designing and managing a budget for each unit, addressing patient complaints, and supervising a staff of 35 clerks and technicians are just a few of the additional roles Ross plays as a man behind the scenes in patient care.

"Probably the most important aspect for the managers is financial management," said Ross, who governs the $5.2 million annual budget of the intensive care nursery. He also monitors budgets for the neonatal, delivery, and critical care transport units.

"One of the biggest pushes in the Hospital now is for cost containment," he said. "As a manager, I monitor the budget month by month to see what influences the variance of the prices over the year. We have to stay on top of it. If there's an increase someplace, I try to figure out where and why in order to keep costs down."

Ross said he likes to spend as much time as possible in the nursing units troubleshooting potential problems.

"I like to make rounds so that I can talk to the people I supervise and find out what's going on on the floor," he said. "There are problem boards located on every unit. I'll check the problem boards to see if there's anything that needs to be addressed, and get the technicians to take care of it.

"I try intentionally to get out there at least three times a day," he said, "just to say hello and to be accessible."

Ross left Mt. Zion Hospital in San Francisco six years ago to join Stanford's administrative team. But he gained his first managerial experience outside the hospital environment, working for Kaiser Aluminum in his native Pittsburgh, Penn.

A history teacher in a high school for delinq ient boys for several years after he graduated from college, Ross said he enjoyed working with young people but found jobs scarce and frustration high.

Because he is "people oriented," Ross said he prefers the hospital environment to working in industry. "Industry is profit-motivated," he said. "That's the driving force. I understand that, sure, but I could never get the satisfaction there that I have to get in what I'm doing."

Though administrative duties demand most of his working day, Ross said he likes to maintain contact with patients. "Sometimes, instead of delegating responsibilities when there's been a theft or other incident, I will get involved and go talk to the patient," he said.

"My experience has been that the fact that you will actually come in and talk with patients and listen to them makes a difference. Usually by the time you leave, they're thanking you for just being there."

—Deborah Franklin

A pick of top ten hospitals

"If I were sick and had to go to a hospital, there are only a few places in the country I'd trust myself to. You could almost count them on both hands."

If this statement came from a patient, one might think he was neurotically fearful. But it was made by the late Dr. John H. Knowles, general director of one of the best hospitals in America, Massachusetts General in Boston.

Since America's 6,965 hospitals make up the largest and costliest system in the world, why are so few acceptable to one in the know? asked the *Ladies' Home Journal* in 1967. To find the answer, the *Journal's* editors picked a panel of 10 of the best-qualified hospital judges in all parts of the country and posed the following question:

"If you or your family required major hospital services—diagnosis or treatment—which twenty-five hospitals in the United States would you select as representative of the best? Which hospitals would you put in the top ten?"

The results of the 1967 poll showed surprising agreement, with the experts picking teaching hospitals as their choice. Stanford University Hospital was then picked among the top 10. It has continued to maintain this rank ever since.

The latest poll on the best hospitals was conducted by *Money* magazine and appeared in its September issue. Although most hospital experts hardly think that hospitals can be chosen like beauty queens, here in alphabetical order are the hospitals that in the jury's opinion provided the best care in a broad range of services:

Barnes Hospital, St. Louis; Brigham and Women's Hospital, Boston; Columbia-Presbyterian Medical Center, New York; Duke University Medical Center, Durham, N.C.; Johns Hopkins Hospital, Baltimore; Massachusetts General Hospital, Boston; New York Hospital-Cornell Medical Center, New York; Stanford University Medical Center, Stanford; University of California at San Francisco Hospitals; Yale-New Haven Hospital, New Haven, Conn.

Stanford was particularly noted for its program in cardiology and cardiovascular surgery.

Librarians offer suggestions on improving course reserve list process

As of August 16, the requested due date for the Meyer Library to receive course reserve lists from the faculty, only approximately 25 percent of the expected lists had been received.

Because the operation of searching, acquiring and processing reserve materials is a time-consuming one, the closer course reserve lists are received to the beginning of each quarter, the less likely materials will be available when classes begin.

On an average, each quarter Meyer Library receives about one-third of the reserve lists on their due date, another third between that due date and registration, and the remainder usually during the first two weeks of each quarter. Both Green Library and the branches receive over half of the graduate reserve lists after registration day.

Faculty are asked to give high priority to submission of reserve lists so that library staff, who process the lists in the order received, can do so as expeditiously as possible. However, delays and student inconvenience are inevitable so long as a majority of the lists are not in hand six weeks before the quarter begins.

Some 20-25 percent of the items requested for reserve are never checked out; processing time could be greatly reduced if reserve lists were restricted to required items only. Recommended reading should not be placed on reserve, although library staff do search these items for availability if requested.

Frustration for students also can be caused by an insufficient number of copies of a reserve item. Contributing to this are underestimates of class enrollments, items lost or charged out and not returned in a timely manner, or subject to borrowing restrictions which make them unavailable for reserve use.

Much reserve material gets extremely heavy use and can simply disintegrate from wear in a short time and requested items may go out of print. Thus material on reserve one year may not be available the next year. Mutilation and destruction of reserve materials, while rare, does occur in larger courses or those with heavy reading lists, with consequent frustration felt by other students.

Returning reserve copies

Even when sufficient numbers of copies are initially placed on reserve, some students choose not to return them in accordance with the assigned loan period. The resulting fines simply do not deter this practice.

Students who leave assignments to the last minute usually find that many others are also waiting for the same material, creating multiple circulation holds and an apparent shortage of copies.

While there are no easy answers to the question of insufficient copies, the Libraries' staff are working with faculty to find solutions to these problems and to improve the course reserve system as a whole. Faculty members are encouraged to communicate with the reserve units which serve their courses as suggestions, questions, and problems arise.

Often a student's first introduction to Stanford University Libraries comes when an instructor uses the term "course reserves."

Course reserves, those items which faculty expect their students to use in conjunction with a particular course, may be books, pamphlets, journal articles, reports, problem sets, exams, cassette tapes, videotapes, recordings, or other materials.

The Libraries' reserve system pulls together all the required readings for a particular course, collected into a central location, a convenience and time-saver for students.

It allows many students brief access to a number of very heavily used library materials as well as faculty members' personal copies of items not in the Libraries collections.

Without such a system, required materials would likely be borrowed by the first person to locate them, thus making the items unavailable in timely fashion to others needing them. While all libraries maintain course reserves, some have an "open reserve" system providing direct public access to shelves for reserve materials and others employ a "closed reserve" system with copies supplied to users by library staff. Several libraries utilize both systems.

Computer catalog

The J. Henry Meyer Memorial Library houses the majority of undergraduate reserves, supporting lower division courses in the humanities and social sciences and selected courses below the 100 level in the physical sciences. The Library's Audio/Visual Services Section handles sound recordings, films, videotapes, and lecture tapes which are placed on reserve.

Meyer processes reserves for approximately 250 courses each quarter, involving some 4,000 titles or an average of 6,000 individual volumes. Reserve circulation reaches 100,000 items each year.

In order to deal more effectively with such a large volume, Meyer Library has developed an online reserve catalog using SPIRES. The reserve catalog is produced on microfiche, and updated each weekday during the early part of each quarter and as needed in the following weeks. Access to reserve holdings is possible by author, title, and course name and number.

The Cecil H. Green Library is responsible for graduate level course reserves in the humanities and social sciences. While the principle users of graduate reserves are Stanford doctoral candidates and other graduate students, 25 percent of its users are faculty, staff, and undergraduates.

Both graduate and undergraduate course reserves for the departments and schools which they serve are maintained by nine of the 10 branch libraries; the Cubberley Education Library reserves materials only for graduate courses. Each library maintains a complete list of its reserve items by class name and number.

Audio-visual materials

An increasing number of reserve items is produced in audio/visual formats. For example, approximately one-fourth of the Engineering Library's reserves are cassettes or reel tapes. The ratio of tapes to available machines is low, which may produce a long wait for some students.

Six weeks before each quarter begins, faculty are asked to submit lists of materials to be placed on reserve for that quarter, to suggest a loan period for each item, (which usually ranges from two hours to three days), and to recommend the number of copies to be placed on reserve based on projected class enrollment and amount of material assigned.

Library staff locate needed items in the stacks or recall those charged out; articles are photocopied in accordance with the terms of existing copyright restrictions. Rush orders are placed for items not owned by the Libraries. Titles purchased from the Stanford Bookstore or other local bookstores normally require a minimum of two to three weeks to be placed on reserve. Titles not available locally, however, even when on a rush basis, require an average of six weeks to purchase, receive, catalog, label, and make available for student borrowing.

Correction: Chemistry ranks fifth

Last week's *Campus Report* erroneously stated that the Stanford Chemistry Department ranked sixth nationally in perceived quality of its faculty, according to the recent national survey of the Conference Board of Associated Research Councils.

Chemistry also was inadvertently omitted from the detailed data published by the department in *Campus Report*. This includes two figures for faculty quality: the first is a raw score ranging from 1 to 5 on a scale where 4 was "strong" and 5 "distinguished"; the second transposed the raw scores onto a scale of 1 to 99, with 50 representing the average and about two-thirds clustering between 40 and 60.

Those figures for chemistry are as follows: California Institute of Technology, 4.9, 74; UG-Berkeley, 4.9, 74; Harvard, 4.9, 74; MIT 4.9, 74; Stanford 4.5, 70; University of Illinois, 4.5, 69; University of Chicago, 4.4, 69; University of Wisconsin, 4.4, 69; Cornell, 4.4, 68.

Strike slows plant improvement work

Several plant improvement projects scheduled to be completed by the beginning of school remain unfinished because of the strike by United Stanford Workers, according to Construction Manager Don Hoppe.

Alvarado Row and Mayfield Avenue are still torn up while new sewers are installed underground. The water return line in the University steam system is being replaced at Florence Moore Hall.

Paving of the Roble/Lagunita parking lot was finished in September and striping is in progress.

Installation of new path lighting near Wilbur Hall and near Lasuen Mall has been delayed. At Escondido Village, a path lighting project also has been delayed, but it would not have been completed prior to the start of school anyway, Hoppe said.

Work on all plant improvement projects stopped at the beginning of the strike as construction workers honored USW's picket lines. Work on several has since restarted. Hoppe said trenches will be marked and protected.

Neiman Marcus comes to Stanford

Stanford University has announced plans to proceed with the final phase of the Stanford Shopping Center renovation project approved by the City of Palo Alto in 1976.

The plans contemplate the addition of a Neiman-Marcus store at the west end of the main shopping center mall. If negotiations with Neiman-Marcus proceed favorably, construction could get under way next summer and the store be opened in the fall of 1984, said Frank Morrow, Director of Real Estate.

Stanford has also applied for Palo Alto Architectural Review Board approval of a 400-car parking deck at the Center to maintain floor-space-to-parking ratios stipulated in contracts with major tenants, and to replace parking that will be lost with the expected addition of Neiman-Marcus. The one-level structure will be built in the existing shopping center parking lot at the corner of Quarry and Arboretum Roads.

"We have estimated that we need an additional 780 spaces," Morrow said. "Construction of a 400-car deck and restriping the existing lots will go far toward closing the gap."

Palo Alto's Architectural Review Board will review the project on Oct. 7, Morrow said. Construction could begin in January and be completed by July of 1983.

The deck will be constructed around a 29,000 square foot atrium preserving three large oak trees on the site. The work will be funded by revenues from the Shopping Center.

Computer support system speeded registration process

Following is an Oct. 4 memo to Provost Albert Hastorf from Registrar Sally Mahoney on fall quarter registration:

On Monday and Tuesday, Sept. 27-28, 11,206 students registered, 349 more than the comparable dates in 1981. Students registering late may do so through Oct. 19. Our traditional "three week" statistics will be based on registration through Tuesday, Oct. 19, and will be available during the week of Nov. 1.

Caption writers notwithstanding, no students were registered by computer this autumn. Eligible students were given registration materials (PTR's) in an outdoor procedure behind Maples Pavilion. Registrar's staff used standard manual procedures to authorize tuition commitment revisions for students eligible to enroll at less than full tuition.

The Controller's collection procedures were unchanged except that those deferring tuition and other fees did so according to the new arrangements about which they had been informed in August. Students will continue to commit their courses by submitting official study lists no later than the second Friday of the quarter, specifically, Oct. 8.

What did change was an ancillary registration procedure involving the means by which students may reserve space in courses limiting enrollments or otherwise requiring "sign-up."

The changes were two-fold. First, we adapted to the Pavilion the "bankers' queue" approach we have been using for several years during Advance Registration at the Old Union. The single queue giving way to multiple stations is a widely recognized method of moving large numbers of people through what otherwise would be single lines moving at highly variable rates. As part of that general approach we also adopted the express line, for use by individuals with single transactions.

Second, we expanded to all courses requiring sign-up the computer support we had used in 1981 to enable freshmen to reserve space in Western Culture courses or to modify the summer assignments they had been given in such courses.

We have yet to conduct a comprehensive evaluation of the procedure, an evaluation which will include the departments involved and some sampling of students as well as the staff who have been directly involved in the procedure. My initial impressions are these:

First, the system of expanded computer support worked remarkably well. Second, especially during the first morning we learned to make needed adjustments in our handling of the bankers' queue, principally by asking ushers to be more assertive to insure that people who did not need to reserve spaces in the relevant courses did not join the line, secondarily by establishing a second express line to handle the flow of single transactions, and finally, by moving pairs of students to each terminal station. In 1981 a student who needed to sign three class lists (typically a freshman) stood in three lines, each involving a 20-25 minute wait. At Monday's morning peak, the clocked and verified waiting time was about 85 minutes. By Tuesday afternoon, a period involving about the same flow, the waiting time had dropped to under 30 minutes to complete the full range of transactions any student required.

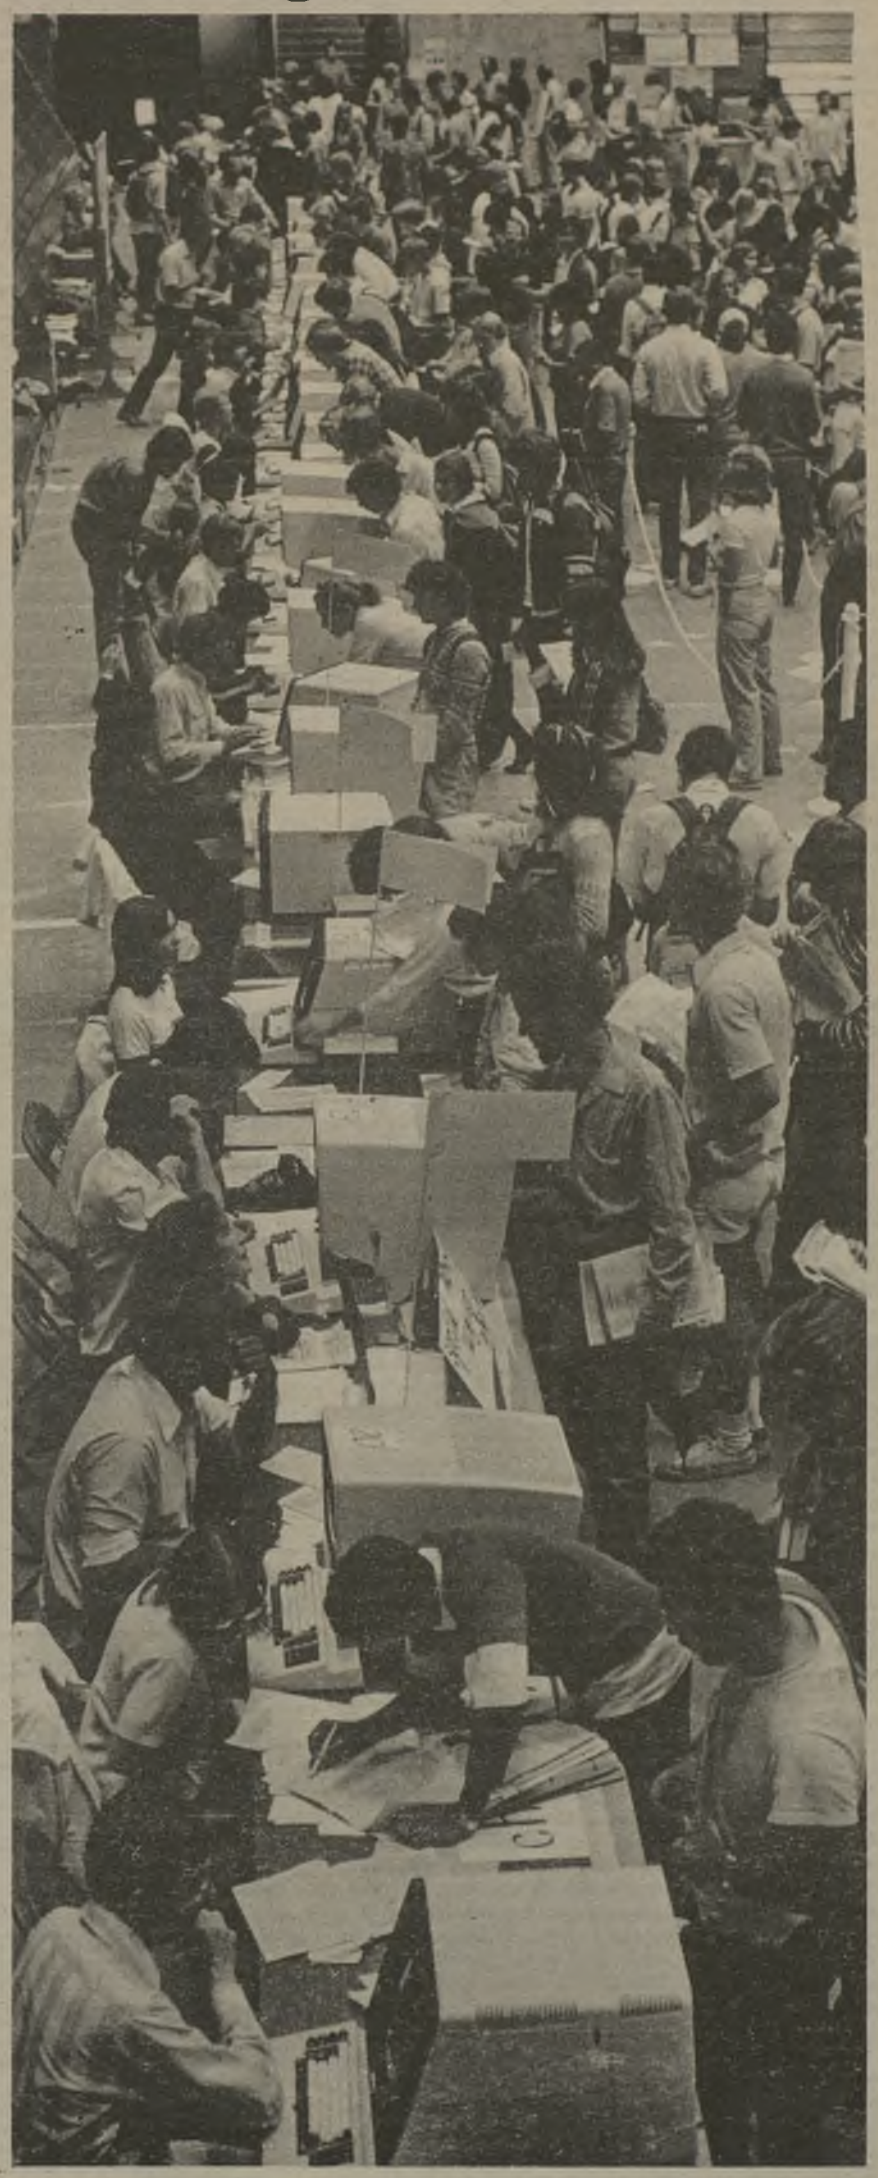
Overall the course reservation system involved 19 departments or programs and 483 courses or (in the case of History 1) course discussion sections. 14,000 spaces were available for reservation, and additional transactions created waiting lists.

As we began the procedures, the courses for which sign-up was required already reflected the reservations made last Spring by continuing students and the Summer assignments made for Freshman Writing and Western Culture courses.

Throughout Monday and Tuesday approximately 6,000 students used the system, creating 13,500 transactions. Of the 6,000 students, 30 were students reserving space *in absentia* primarily because of religious obligations. Their names were placed in the system at the hour they would have been permitted to reserve space in person.

Separating out the single transactions, predominantly in physical education courses attracting graduate students as well as undergraduates from all classes, we find that students in the multiple transactions queue averaged a little more than three (3) course reservations each. Some freshmen who had not taken advantage of Summer assignments reported five transactions, in short, their entire programs (e.g., Western Culture, writing, math, chemistry and p.e.).

At each terminal station, a student had information about the status of all courses available for sign-up, making it easier than the prior system, involving separate lines for separate courses, for students to juggle personal plans among a range of courses. We expect that this improved the quality of the reservation lists departments and programs received at Tuesday's close.



In contrast with the results of the manual course reservation procedures of past years, these lists alphabetized the names of students for whom places initially were available and ordered (according to letter time of reservation) the waiting lists of students. In addition, the reservation data base leaves us with tools for comparing "sign-ups" with course commitments students will submit on official study lists by this Friday, Oct. 8. For the first time we shall have basis for assessing the efficacy of the course sign-up system itself.

Assistant Registrar Gloria Garing was responsible for the functioning of this system as she is responsible for all other aspects of the registration procedure. Bill Witscher of the Office of Management and Financial Planning was responsible for conceiving the SPIRES supported system in 1981 and expanding it for this registration. Both received substantial help from our NSI (Network for Student Information) staff at CIT, as the result of which the system now is fully integrated with our other systems efforts.

The entire CIT organization turned its attention to the support of this effort securing and installing, with the cooperation of our local IBM marketing representative, the bank of 22 terminals (including new IBM 3279 color display terminals). They organized the training of the largely student staff who worked the terminal stations and monitored the impact of this procedure on others using the University's 3081 mainframe.

On Tuesday the mainframe experienced hardware problems, twice affecting the course reservation system for a total of approximately 45 minutes. Our manual backup procedures were ready to go into place but were not needed because we were able to sustain the highly satisfactory student flow we had achieved by Tuesday.

Both we and CIT staff are examining the procedure with attention to how we might make improvement in the future and with concern for what other University officers interested in similar applications might learn from our experience. I shall report again when our systematic evaluation is complete. For the present, we're pleased and grateful, not only to the staff but to our student and departmental clientele for their cooperation and suggestions.

Ombudsperson's report for 1981-82

Student complaints about teaching, courses decline

Following is the report of the University Ombudsperson, 1981-82.

"The Ombudsman's task is to protect the interests and rights of members of the Stanford Community from injustices or abuses of discretion, from gross inefficiency, from unnecessary delay and complication in administration of university rules and regulations, and from inconsistency, unfairness, unresponsiveness, and prejudice in the individual's experience with university activities. The Ombudsman exists to receive, examine and channel the complaints and grievances of members of the Stanford community, and to secure expeditious and impartial redress." (From the Charge to the Ombudsman, August 1973).

Use of the Ombudsperson's Office

During the past year the office of the Ombudsperson has carried out its mandate with the additional strength of the new office of Associate Ombudsperson at the Medical School. As shown in the accompanying report from Dr. Allen Barbour, the problems of medical school students, house staff and faculty are, as compared to other parts of the university, peculiar to that institution and need special attention. It is very gratifying that the extension of this office to the Medical School has had and will continue to have the knowledge and skill of Dr. Barbour and his Administrative Assistant, Linda Northway.

The total number of "cases" brought to the campus office has declined as compared with previous years (from 677 in 1980-81 to 555 in 1981-82). There was a similar decline in complaints brought to the campus office by undergraduates and graduates (1980-81: 474; 1981-82: 371). However, medical students seeking help from the Associate Ombudsperson of the Medical School numbered about 38, bringing the total number of students seen by both offices to approximately 409. (The term "case" is ambiguous and fails to reflect an increase in groups presenting a common problem or complaint. There has been a significant increase in the number of such group cases this academic year, 1981-82.)

Student Academic Complaints

Student complaints about teaching, course organization and the like have declined from 39 in 1980 to 20 in the past year. There was also a significant decline in problems about grading, from 49 in 1980-81 to 34 in 1981-82. This office interprets these changes as reflecting improvement in courses where complaints about teaching and grading have been common, i.e. chemistry and mathematics. Both departments have been very responsive to information from this office that something was wrong or appeared to be wrong.

The cluster of general "academic" complaints by both undergraduates and graduate students rose from 87 to approximately 157 (including medical students). These are extremely varied but may be described in general as complaints about university regulations and requirements. For example, in the case of the expulsion of the Zeta Psi fraternity, the administration charged the membership with violating their "collective responsibility agreement." There is no question that under that concept Zeta Psi was guilty. Students and others found the notion of collective responsibility objectionable because, in application, it involved punishing the innocent as well as the guilty. Clearly, collective responsibility modifies individual rights, and may be defended, as Professor John Kaplan has pointed out, on the grounds of a group dynamic which creates an entity transcending the participating individuals. Needless to say, this is not an easy conception for students and others to accept and to understand.

Hidden in this large figure of academic complaints are two specific problem areas that need serious attention. Both concern graduate programs in the Department of Communication. Master degree programs in Broadcast Journalism and Print Journalism have both been severely criticized by participating students. One phrase used by the Journalism students expresses the deficiencies in both programs: "organization and communications problems." Criticism from both groups imply or express positive suggestions for improving the situation in the future. No great insight is needed to recognize behind these criticisms the need for greater financial support for both programs. Current Departmental concern with these problems is reassuring.

Two Special Problems

1. *Academic—Industrial Relations*

Early in December, 1981, students, undergraduate and graduate, and post doctoral students, brought to this office their concerns about actual and potential conflict of interest posed by persons with academic appointments in some relations with industry. The problem had, of course, long been recognized by faculty and researchers, but this office was surprised to find students keenly concerned about how faculty relations with industry affected their education.

Among student concerns two were perhaps the most pervasive: fear that some of their research was skewed toward some industrial purpose; and fear that student research results might be used without proper acknowledgement by a "principal investigator" or research director. Another more general point was the feeling that academic relations between faculty and students were weakened by the diversion of faculty energy and attention away from the classroom or laboratory toward industrial interests.

This office held a number of meetings with a group of graduate students expressing these concerns which resulted in a plan, sponsored by the Graduate Student Organization and SWOPSI, to publicize and examine the issues involved by a series of public programs. These were opened by a keynote address by President Kennedy; the ideas and proposals advanced in these programs have been fully reported elsewhere.

2. *Taiwanese Students*

As a consequence of an article in the *Stanford Independent*, this office became aware of a strange and disconcerting situation. The article charged Taiwanese students with spying on each other and reporting dissident views to the Kuomingtang. Soon after the publication of the article several Taiwanese students came to denounce these charges and to seek advice on how to counter what they claimed to be a false accusation both with regard to their own conduct and that of the Taiwanese government. On the surface this seemed to be a reasonable request and, if their objection was sustained, a public apology by the *Stanford Independent* seemed to be in order.

On investigating the bases for the *Independent* article it was evident that there is here at Stanford and in other institutions nationwide a system of Taiwanese student spying on each other and referring their findings to the Taiwan government. The objective is to suppress any criticism of the Taiwan regime or dissent from its totalitarian principles. The documentation is extensive, including calls in the United States Congress for an investigation of Taiwanese "intelligence surveillance" in this country. It is only fair to add that the active Taiwanese informants appear to be a limited group, involving some but not all Taiwanese students. Furthermore, some Taiwanese nationals other than students have been involved in these activities.

The Honor Code

As a member (ex officio) of the President's Honor Code Commission, the Ombudsperson has the opportunity to discuss problems of the application and interpretation of the Honor Code as they are reflected in this office. A most serious problem, of which the Honor Code Commission is fully aware, is the lack of knowledge by faculty of the Honor Code's provisions and its interpretation. This is evident, for example, from the frequent inquiries to this office concerning the procedure by which Honor Code violations are to be processed.

As has been pointed out in previous reports, the "third person" responsibility is extremely difficult for many students to fulfill. There needs to be some description of conditions under which it is viable for a student to report a violation by another student. This is partly a matter of strength and kind of evidence which is nowhere clearly discussed and explained. It is hoped that the 1982-83 Honor Code Commission will address this matter.

The number of Honor Code problems that come to the attention of this office continues to be high (70 in 1980-81, 63 in 1981-82). It should be noted that by no means all Honor Code violations or charges of violation are known to this office. (When established procedures are followed they go directly to the University Counsel, John Schwartz.)

As suggested above, inquiries by faculty concerning the Honor Code, how to proceed with a charge of violation, and the judicial process itself, are fairly frequent. The most substantial part of Honor Code cases dealt with in this office are those students who have been charged with a violation and those who suspect others of having cheated. In these instances, the office serves as a source of information and advice and gives those concerned an opportunity to air a troublesome situation.

Academic Staff Problems

1. *Lecturers*

Problems among academic staff and nonacademic staff remain numerous. In the former a considerable number were difficulties that lecturers in French and Italian expressed concerning their status and teaching conditions. This is not new; for the past several years there have been many grievances voiced by this group and publically referred to in previous reports. At this writing, after numerous consultations with the chairman of the department (initiated at his request), it appears that improved communications by the chairman with the lecturers and the ceding of greater control of language teaching to the lecturers themselves promise a resolution of these problems. It is hoped that the incoming chairman will implement the same policies.

2. *Librarians*

As reported before, some members of the library staff have had difficulties that appear to derive from arbitrary decisions, lack of consultation and an insensitive disregard of their knowledge as experienced professional librarians. Substantial evidence to this effect has come not only from some librarians but from other sources. To what degree this will be reflected in the recent survey of the library system is

Associate ombudsperson for Medical School reports

Pervasive student anxiety in competitive environment

Following is a report of the associate University Ombudsperson for the Medical School, 1981-82.

The office of the Associate University Ombudsperson was established in September, 1981. The Associate University Ombudsperson, Allen B. Barbour, was appointed by the President of the University, Donald Kennedy, on the recommendation of the Vice-President of Medical Affairs, Lawrence G. Crowley. The decision to provide an extension of the University Ombudsperson Office in the Medical School was based on reports of the Committee for the Well-Being of Medical Students and its Chairperson, C. Peter Rosenbaum, the Executive Committee of the Medical School, and the University Ombudsperson, John D. Goheen. The consensus of these recommendations was that such an office was deemed necessary in order that problems unique to individuals in a medical setting could be addressed by a member of this community who had knowledge of its special circumstances. The jurisdiction specified for this office was all Medical School employees (faculty and staff), medical students, graduate students in programs at the school, the hospital house staff (M.D. interns and residents in post-graduate training), and post-doctoral fellows. Hospital employees other than the house staff were excluded, although it is understood that any members of the Stanford community, not otherwise represented, have access to the office of John D. Goheen and staff.

It appears that the office has served a real need for the Medical School. The formal grievances, numbering 70, are but the tip of an iceberg in that many grievances reflect on-going school problems which call for major strategic resolutions. Other problems can be solved by providing information. Sometimes solutions to problems are stimulated by the existence of an Ombudsperson or the sound of his voice on the phone. The office also serves as a sounding board for a spectrum of concerns, both general and specific, from all sectors of the school. From this source the office is often active in addressing school problems which did not necessarily surface as personal grievances.

The office has discovered that many clients have misconceptions of their rights as employees or students and express fears of reprisal, loss of confidentiality, etc. Prospective clients are assured that confidentiality is indeed respected and no case is carried any further than the client wishes. The airing of a grievance is often helpful in itself. Nothing is lost in a preliminary interview. The office is specifically enjoined *not* to be agents of the administration but to be as impartial as possible. That is precisely why the office can often be effective in resolving problems.

Case summary, 1981-82
Office of the Associate University Ombudsperson

TOTAL	1	1	37	8	6	8	3	6	70

For helping in the work of the novice year, special thanks is expressed for the support and cooperation of Linda Northway, the assistant in this office; John D. Goheen, Sara Stephenson, and Leah Kaplan in the University Ombudsperson's office; John P. Steward, associate dean for student affairs; Lawrence G. Crowley and our new Dean, Dominick P. Purpura; Rosemary Hornby, manager of the Human Resources Group in the School; John L. Wilson, associate dean and chairperson of the Committee on Student Performance; James Silverman, chief of the medical staff; and Helen Rantz, director of the house staff office. And many thanks and appreciation to the many loyal medical students who have inspired this office with their hearts and thoughtful appraisals.

This report will first address some general problems pertaining to medical students.

1. **The learning atmosphere.** Of 4,800 applicants the school admits 86 superlative students each year whose average age is 25, many with Ph.D.s. These mature graduate students are then treated too often like children. The students describe a pervasive anxiety and bewilderment about the difficulties of preserving their human values in a competitive intellectual environment, the mass of information to be learned, the fear of mistakes, and the overwhelming task of becoming a truly effective physician. This is a complex problem with multiple factors. Medical students feel generally that the faculty places an inordinate emphasis on:

* Scholastic achievement over the process of learning.
* Competition over cooperation.
* The knowledge more than the personal qualities of the student.
* Facts and procedures, getting the work done, over the care of the patient.
* The use of intellectual one-upmanship and exposure of students' ignorance as learning incentives as opposed to positive help with the learning process.
* Esoterica at the expense of common sense and basic approaches.
* Science and the disease model of illness without sufficient attention to a psychosocial understanding of the human needs of patients.
* Faculty-student polarity in lieu of a more collegial relationship.

A shift in emphasis along these lines would go a long way toward restoring a more positive and joyous attitude of students toward medicine in general and their education in particular. There is a need to listen, weigh, and respond to the concerns of students about their own education, to insure their basic rights as members of the Stanford community, to include them in deliberations which determine their fate whenever possible, and to clarify mutual goals and expectations.

The school has an elective curriculum and a no grades evaluation system which attracts creative students; unfortunately, these advantages are nullified to some extent by the requirement of passing the National Board examination, Part I, at the end of the second year, and by

continued on next page

Nonacademic staff complaints high...

continued from page 22

yet to be seen, but it is clear that the administration is aware of these problems. There is, at least, hope of improvement.

Nonacademic Staff Problems

The number of problems and complaints by nonacademic staff remains high (1980-81: 81, 1981-82: 62). The range of problems is extremely varied, and may be characterized in general as concerns and discontents about job-related matters. Requests for information and advice are often addressed to this office, and many cases are referred to appropriate departments or administrative officers such as personnel and affirmative action officers. Others are dealt with directly whenever that is the most effective means.

Sexual Harassment

The Ombudsperson's office is charged with the responsibility of resolving informally problems of sexual harassment. This it has attempted to do in eight cases during the past year. In all instances these appear to be resolved, which suggests that an informal procedure is effective and preferable to the formal procedure as outlined in the statement, "Policy on Sexual Harassment."

Sexual harassment is defined as follows: ". . .it may be described as repeated and unwanted sexual behavior, such as physical contact and verbal comments or suggestions, which adversely affect the working or learning environment." This office is quite aware that this definition raises problems of interpretation: what appears to one person as offensive behavior may not to another.

Student Participation in the Ombudsperson's Office

For several years students have volunteered to participate in the functions of the Ombudsperson's office. They have performed in two basic ways: as persons sensitive to various student problems and to issues concerning the Honor Code. During the past year this group turned its attention to rights and responsibilities of students. This interest arose because of the need for a clarification of some of these matters, and the need to bring together in a single short statement the scattered information in various university publications. To achieve this objective the students involved formed a "task force" of themselves, several members of the faculty, a member of the staff of the Dean of Student Affairs and the staff of the Ombudsperson's office. A number of meetings were held for the purpose of formulating a draft of "rights and responsibilities." This will be continued next year and, it is hoped, the final formulation of the document will be carried out by an ASSU task force. This will be widely discussed with relevant administrative officers in the course of reaching the final formulation. The following students should be congratulated for their interest and initiative in organizing the task force: Raga Elim, Nick Gault, Tim Hussey, and Mike Reeds.

Concluding Remarks

The accompanying table is useful as an indication of the range of problems and complaints reaching the campus office. Since a great variety of cases is grouped under a given category, their particularity is hidden. The selected problems discussed in the report are, for the most part, not explicit in the table, but are reconstructed from detailed records of a particular case or a small subclass of cases.

The selection of problems discussed is a product of much discussion with various persons in the university about issues of interest to students, faculty, and staff. They have also been thoroughly discussed by the persons immediately connected with the functions of the office, Allen Barbour, Linda Northway, Leah Kaplan, and Sara Stephenson. Many issues needed thought and analysis are shared by all the staff. Difficult as it often is, the attempt is always to analyze problems in terms of fairness and justice. The work of the Ombudsperson's office becomes an exercise in practical ethics.

the need to secure strong letters of recommendation during the fourth year for appointments as interns. The problem of National Boards may be eased by the proposed revision of the basic science curriculum if it results in improved and better coordinated teaching, combining clinical relevance with cutting edge science, fewer lectures, and better attendance. In regard to intern letters, students express concerns about the participation of house staff in clerkship (supervised patient care) evaluations when they feel badgered by what they consider to be a difficult and threatening resident. This could be corrected by having the students evaluate the residents so that the faculty can learn where the difficulties lie. Also, students, concerned about the need to appear knowledgeable in terms of their evaluations, express fears of exposing what they don't know and need to know, and this interferes with the learning process.

Student concerns are being offset by responsive meetings with Dean Purpura, by Associate Dean Steward and his staff, the Committee on the Well-Being of Medical Students, the preceptor groups sponsored by Robert W. Cutler, and by student support groups with coordination by this office, but all of these responses need to be broadened and intensified. The solution to the basic problem of student alienation lies with the rank and file faculty as learning facilitators, role models, colleagues, and friends of students.

2. **The Committee on Student Performance (CSP).** In the past academic year a more stringent set of rules and guidelines came into effect regarding remedial actions for academic failures. This was followed by a series of student grievances about committee actions, although there was only one grievance about a course failure, the student complaining about the rigidity of grading "on the curve." The concerns of the students were evaluated, summarized, and transmitted by this office to the committee. The CSP and the Office of Student Affairs (OSA) have been responsive to these concerns, clarified many points, and issued a more explicit protocol. Meanwhile, unrelated to the above, the committee has been reduced to five members with a new chairperson, Ruth T. Gross. All these changes will help expedite the work of this important committee.

About one third of all medical students come before the CSP at one time or another for academic failures. Why should one of the finest medical student bodies on earth have such an inordinate number of failures? *The system is obviously failing, but the students get the F's.* There should be few if any failures along the way in a graduate program of select students. The CSP is confronted with an immense problem not of their making. Although the remedial actions proscribed by the CSP are thoughtfully considered and uniform, it is not surprising that such actions are often viewed by the students as more disciplinary than helpful. The problem lies not in the capacity or dedication of the students. Individual remedial actions provide no more than symptomatic relief. The basic problem demands preventive action at its roots. One reason for this complex problem is a discordance between student selection and faculty expectations. Although we have a distinct research emphasis, we nevertheless select many students for promise of excellence in clinical care and community leadership. The discord develops between such students and their capacity to master basic science courses charged with an enormous amount of research details at the expense of clinical relevance. This is not to suggest a major change in course emphasis which is indeed unique and appropriate for Stanford. But there needs to be a somewhat better balance between student needs for medical practice and course content along with a more extensive support and counseling program to help students in the learning process.

The CSP also handles most violations of the Fundamental Standard and Honor Code but with marginal protection of defendants for due process. The office has analyzed this issue in some detail recently and has suggested a review by the school. Corrective actions are now under way to establish a more clearly defined protocol of due process.

3. **Summer Courses.** Only one basic science course, biostatistics, is given during summer quarter. The result is that students, already beset by monumental debt, waste the summer quarter of each year while high cost of living expenses go on, and some lose one fourth of an annual scholarship stipend not offset by course work. Furthermore, schedules for core courses are correspondingly tighter the remainder of the year, and students find it necessary to omit other important courses such as genetics. Robert W. Cutler, chairperson of the committee on courses and curriculum, and the student body have tried but failed to elicit a positive faculty response for the provision of summer courses. The faculty has never granted credit for a basic science course taken during the summer (or any other time) at another medical school, after admission of the student to Stanford Medical School. Thus the summer quarter lies relatively barren. This problem awaits resolution by the faculty.

4. **Clerkships.** Changing guidelines for clerkships: adding, dropping, substituting; which clerkships count most in specific recommendations for internships; the timing of dean's letters, etc., also provoked grievances during the year. Most of these problems have been resolved.

5. **Financial Aid.** Delays in expediting loans, etc., related in part to changing personnel, prompted a series of grievances in the fall. The Financial Aid Office and the OSA responded quickly to this situation, and the office has since stabilized under the direction of Kathy Krause and Stuart Rosse.

FACULTY:

The problems of the students described above may reflect to some extent corresponding problems for the faculty. The Medical School has an outstanding faculty that strive hard for the best in teaching, patient care, and research, but the emphasis is strictly on the latter when it comes to tenure. So the faculty functions in its own competitive atmosphere with serious problems of recognition, promotion, tenure, salaries, interdepartmental and sometimes intradepartmental rivalries. They are frustrated by pressures to produce Faculty Practice Plan (FPP) income at the expense of research and teaching, coupled with major FPP financial losses from an inadequate billing system and Medi-Cal restrictions.

These problems will not be addressed specifically in this first report. The coordinated leadership of the Vice-President of Medical Affairs, Lawrence G. Crowley, and Dean Dominick P. Purpura is expected to provide the ethos necessary to unify the faculty with a more collegial spirit toward common goals of the school.

HOUSE STAFF:

By and large, the house staff brings few grievances to this office. This is probably due to the responsive leadership of James Silverman, chief of the medical staff, and the active support of Helen Rantz, director of the House Staff Office. Our office can, however, complement these offices in helping resolve problems whenever appropriate.

1. *Departmental feedback.* A known problem in the past has been inadequate ongoing departmental feedback to house staff re quality of performance. Supportive critical actions along the way are obviously better than hatchet-like actions at the end. This problem may well have improved as no such grievances surfaced during the year.

2. *Counseling.* This office together with the House Staff Office, the Committee for Well-Being of House Staff and its chairperson, Kenneth S. Peters, has initiated a continuing support for spouses arranged through the Stanford Help Center. However, the interns and residents themselves, although subject to inordinate stresses during these training years, have neither special support groups nor any facility for counseling when this seems appropriate. The Psychiatry Department does provide a useful but limited evaluation, but the individual is then referred for private counseling if continued care is warranted. The residents are bureaucratically hospital employees and not graduate students, and for this reason they are not entitled to Cowell counseling services on campus. Private counseling is inadequately covered by their health insurance and this is a deterrent to ongoing care.

3. *Psychiatry Department.* The regular faculty in this department have major research and scientific commitments. A good share of the clinical teaching is done by clinical faculty in their private offices, apart from the Stanford clinics where the residents actually see the patients. Residents attracted to Stanford by its research facilities are presumably quite content with their training, but several grievances emerged during the year from residents devoted to patient care careers about the limited teaching by the regular faculty as well as about certain administrative decisions. These problems were discussed in detail with the department chairperson who has taken certain steps to improve faculty-house staff liaison, and the current junior residents are more content with the program.

STAFF PERSONNEL:

1. *Job descriptions, expectations, evaluations, and terminations.* This is a frustrating area with many grievances. Neither supervisors nor employees understand University personnel policy, generally speaking. We have a truly excellent human resources group headed by Rosemary Hornby, with equal concerns for departmental needs and the welfare of employees. *They should be consulted for advice early and much more often during the incipient stage of personnel problems.* A major problem is the tendency of employers to write overly generous, uncritical evaluations during the early stages, sometimes years, of employment, even though the employer has serious reservations, then to about-face when termination is desired with a super-critical evaluation demanding radical changes which could not possibly be accomplished by the dismayed employee in the limited time remaining. Often there has been little or not informal, person-to-person discussions, with clarification of expectations, helpful suggestions, etc. Sometimes the reason for termination given at the end is not the real reason. The victims of this process range from new clerks to long established research personnel and sometimes faculty. The offices of Ombudsperson and Human Resource Group are placed in the difficult position, after investigating both sides, of explaining to the employee the real deficiencies that should have been disclosed by the employer long before, of helping the employee through the termination with as much grace as possible, or of facilitating a formal grievance procedure.

It behooves us all to learn to be straight-firm but helpful—with our employees. The Human Resource Group has always been available for help by finding a better job placement, career planning, etc., but these positive steps are next to impossible at the end during a tumultuous termination.

POST-DOCTORAL FELLOWS:

This group comprises about 400 of the 500 University postdoctoral fellows (nonmatriculated students who have completed Ph.D. and M.D. degrees, now involved in postgraduate specialty training in a research lab or patient care specialty). Fellows provide important patient care and research responsibilities at the Medical School. They have administrative support but no internal or external leadership except for individual faculty and department chairpersons. As a group they have problems re salaries, benefits, University housing, etc. Many of this group have completed previous educational degrees from Stanford and may continue their affiliation as members of the School of Medicine faculty.

It is the hope of this office that the problem of high echelon representation in the school, missing in the past, will be addressed, in order that the fellows will be more positively identified and integrated as essential and valuable members of the Stanford community.

The Associate University Ombudsperson's charge is to protect the interests and rights of members of the Stanford Medical School community and to act on his own initiative when he perceives over-all problems which compromise the well-being of the school. There are many ways an Ombudsperson can be helpful in detecting and offering solutions to problems of the school and its faculty, staff, students, house staff and post-doctoral fellows. We have common goals, and need to work together more closely. Your suggestions are welcomed. The office at 800 Welch Road, Suite 221, 497-6494, is open Monday through Friday.

Allen B. Barbour
Ombudsperson

Full indirect cost reimbursement appears assured—Kennedy

Universities apparently will continue to receive full reimbursement for indirect costs of research funded by the National Institutes of Health during fiscal 1983, Stanford President Donald Kennedy told the Faculty Senate Thursday, Sept. 30.

NIH and the Alcohol, Drug Abuse, and Mental Health Administration had proposed to pay only 90 percent of negotiated indirect costs on research, a change that would have cost Stanford alone $2.2 million in fiscal 1983, including $1.2 million at the Medical School. Nationally, the cut would have amounted to nearly $70 million for expenses incurred on NIH-funded projects, mainly at universities.

Indirect costs include the proportionate share of such pooled costs as utilities, administration, libraries, shared equipment, depreciation, and building maintenance charged to research projects. Direct costs, such as salaries, are charged separately to each project.

Congress included the funds for full payment of indirect funds in its Continuing Resolution and directed the Department of Health and Human Services, which includes both NIH and ADAMHA, to continue supporting research under current terms and conditions. President Reagan subsequently signed this resolution.

Committee action

The House Appropriations Committee directed the Department to pay full indirect costs, but also called for a review of these expenses by the Department in consultation with universities.

"We welcome that review and will participate actively in it," Kennedy told the Faculty Senate. During the summer, he and several other major university presidents deeply concerned by the NIH proposal met with major administration officials and key members of Congress.

While recent Congressional actions are "encouraging," Kennedy cautioned that "The political situation in Washington is highly volatile. The Continuing Resolution is in conference (committee Sept. 30); it could be vetoed by the President.

"The appropriations process is still under way, and will not be complete before the lame duck session of Congress, if then."

The House Appropriations Committee report notes that "University administrators contend that the distinction between direct and indirect costs reflects accounting methodology, not a difference in the reality or the necessity of the costs for the research, whereas many scientists perceive rising indirect costs as making an unwarranted claim on the total funds available for research. . . .

"The Committee is persuaded that indirect costs are a legitimate component of the costs incurred in performing biomedical research and should be adequately reimbursed.

"The Committee is also concerned by the widespread perception that federally sponsored research may be bearing more than its fair share of these costs. The indirect cost level as a percentage of the total costs of research grants has increased from 15 percent in 1966 to 20.5 percent in 1972 and 29.5 percent in 1981. In 1980 and 1981, reimbursements for indirect costs grew faster than the inflation rate, while direct costs of doing research did not.

"The Committee requests the Secretary of Health and Human Services, in cooperation with the NIH director, to make a careful review. . .including consultation with the universities and other research organizations most directly affected, and to submit. . .recommendations. . .for discussion in advance of hearings on the 1984 budget request.

"The Committee also intends to ask the Comptroller General to make another independent review of this subject."

Institutions are reimbursed retrospectively for indirect costs after they have been incurred and paid. Each institution is reimbursed at a rate calculated by federally prescribed methods, using federally audited costs, and negotiated by federal auditors.

Between 1981, and 1982, Stanford and federal auditors determined which University expenses were allowable indirect costs under the terms of Circular A-21, a directive of the federal Office of Management and Budget.

The University recovers its indirect costs through a surcharge on each contract or grant. The percent surcharge—or indirect cost recovery rate—is negotiated periodically by the University and federal government. The rate is determined by dividing the dollar value of total projected research volume into the total of all allowable indirect costs. The 1982-83 rate is 69 percent, up from 58 percent in 1981-82. Eight points of the increase are attributed to increased energy and facilities maintenance costs.

Stanford requires full reimbursement for both the overhead (indirect) and actual (direct) costs of research it performs for the government and other parties. Stanford's policy of full recovery is not always matched by other, especially public, institutions.

Most universities calculate indirect cost recovery rates using the same method, but the actual rates vary widely, partly due to differences in how universities are organized and managed.

Some institutions charge research projects directly for utility costs, janitorial services, police or security, and other allowable costs instead of figuring them as overhead, for example. Such accounting differences do not change the total costs of conducting research, but do make rate comparisons among universities difficult.

Most of the money recovered through reimbursements for indirect costs goes to the University's operating budget.

If the University fails to receive projected payments for indirect costs, the impact is felt directly on the operating budget. Indirect cost recovery currently accounts for about $50 million in the 1981-82 operating budget of $178 million.

Had the NIH proposals been adopted on a government-wide basis, Stanford would have lost as much as $5 million during the current fiscal year. An NIH proposal to reimburse indirect costs for the current year at last year's rate and to limit reimbursement of expenses for departmental administration could have cost Stanford as much as $20 million, if adopted by all government agencies.

Fire alarm loop serving dorms deliberately cut Monday

One of five main fire alarm loops serving the Stanford campus was deliberately cut Monday night, Oct. 4, temporarily leaving five campus dormitories without an automatic link to the Fire Department, according to Campus Police Chief Marvin Herrington.

He called the vandalism "very serious. . .potentially life threatening." Service to the dorms was restored by 3:30 p.m. Tuesday.

Most fires are reported through the automatic alarm system.

While hand-pulled alarms will make a noise in their local area, they will not automatically report the location to the Fire Department until the loop is repaired, Herrington said. Repair crews were routinely summoned Monday night when the system showed a short-circuit in the loop. The cuts were found near Encina Hall and Bonair Siding, Tuesday noon, Oct. 5.

"There's no question it was deliberate," Herrington said. "Wires were cut in several places." As a precaution, any fires should be reported to the station by dialing 911.

Dormitories on the affected loop include Toyon, Branner, Crothers, Wilbur, and Stern.

Other facilities affected include Centrex, Plant Services, the Credit Union, Food Services, Maples Pavilion, Stores, Stanford Stadium, Encina, Meyer Library, Center for Education Research, Old Union, Education School, Main Library, Hoover, Memorial Auditorium, Graduate School of Business, President's Office, History Corner, Math Corner, Psychology, Terman, the Press Building, Applied Electronics Laboratory, High Energy Physics Laboratory, Carnegie Institution, Sherman Fairchild, Cancer Research, and Hemodialysis.

A criminal investigation is under way, Herrington said. Anyone with information may contact him at 497-9633, or dial 911 after normal business hours.

University audiovisual supervisor Bill Cleveland Monday night found the basement of Memorial Auditorium flooded with 2½ to 3 feet of water. A garden hose apparently was used to fill the area. There was no damage to the auditorium itself.

Strike. . .

continued from page 9

University operations continued without serious impairment, but with many managers, supervisors, and other employees growing increasingly tired from long hours of work. Police officers continue working 12-hour shifts. Police Chief Marvin Herrington said that with the exception of strike-related vandalism, crime on campus is unusually low.

At the Food Service, director Maxine Anderson reported managers were joined by volunteers and paid student hashers in serving approximately 1,300 students per meal. Normally 3,300 students would eat in Food Service operated dorms. Beginning this week, dinner is being served in Florence Moore Hall. Breakfast and lunch only are served at Wilbur Hall.

At SLAC, managers, job-shoppers, and others are working long hours so the accelerator can be turned on and experiments run beginning Oct. 10. The project is on schedule, despite daily picketing at the main entrance that sometimes delays entry of employees and deliveries.

Responding to faculty questions at Thursday's Senate meeting, Kennedy indicated that the allocation of funds in the University's offer between wages and benefits might be modified, if the union so desired, and that union interest in "moving money between the years" also could be discussed. "We've about run out of room, but I think some things can be done," he said.

"A significant move by USW is now required to get the bargaining process out of its present impasse," he added. "The union leadership, instead of using the progress of collective bargaining seriously, has sought to settle it in every way possible—on the picket line, in the media, by political pressure, and now finally by personal harassment. But it will be settled only at the table, and only through the introduction, by USW's representatives, of a note of realism."

The personal harassment Kennedy referred to was a USW vigil outside his home, the University-owned Lou Henry Hoover house. By 6:15 a.m. Tuesday the vigil had dwindled to one protestor in a sleeping bag watched over by one Stanford police officer in a car.

Thursday afternoon more than dozen people participating in the vigil stood on the sidewalk observing a reception Kennedy hosted on the large lawn for new graduate students.

On Monday Baratz said the University's compensation documents showed the union had won its battle against an administration he termed "arrogant and ruthless."

"No matter what happens from here on out, we've proven the union was right. Breaking the union was the point. There's no other agenda."

Asked what could possibly end the current stalemate between the union and University, Baratz replied: "I don't know how to offer a settlement anymore."—**Karen Bartholomew**

Authoritarian economies assessed

The most successful Third World economies are "uniformly authoritarian, with strong governments moderated by fairly consistent adherence to legality and a constitutional order," a Hoover Institution scholar contends.

Prof. Robert Wesson, UC-Santa Barbara political sciences and senior research fellow at Hoover, reaches this conclusion in a new Hoover Institution Press collection of essays on Communism in Central America and the Caribbean.

In the American hemisphere, those economies most successful in raising their total national product include Mexico "where the governing party is completely dominant but observes democratic forms"

Senate report

Senate approves MA in International Policy Studies

TO MEMBERS OF THE ACADEMIC COUNCIL FIFTEENTH SENATE REPORT No. 2

A meeting of the Fifteenth Senate of the Academic Council was held on Thursday, September 30, 1982 beginning at approximately 3:30 p.m., in Room 180 of the School of Law, with Chairman Alexander L. Fetter presiding.

On this occasion the Senate took a number of actions, as follows:

1. Conferral of Bachelors' Degrees

On the recommendation of the *Committee on Academic Appraisal and Achievement*, the Senate, by unanimous voice vote, conferred bachelors' degrees on candidates who had met the various requirements for those degrees.

2. Conferral of Advanced Degrees

On the recommendation of the *Committee on Graduate Studies*, the Senate, by unanimous voice vote, conferred advanced degrees on candidates who had met the various requirements for those degrees.

3. Revocation of Master's Degree

On the recommendation of the Committee on Graduate Studies, the Senate revoked a Master's Degree awarded in April by clerical. Confidentiality was preserved in the matter, but it was established that the student involved recognized the error and that the revocation was not controversial.

4. Senate XV Photographs for University Archives

The Senate, by consensus, gave assent to the taking of official photographs of its first annual meeting for the University Archives and for the *Daily*.

5. Election of New Member to Steering Committee XV

By ballot, the Senate elected Professor H. Craig Heller to replace Professor Carolyn Lougee on the Steering Committee of the Fifteenth Senate.

6. Ex Officio Representation for Undergraduate Education

On the recommendation of the Steering Committee, the Senate by unanimous voice vote, retained the Vice Provost for Undergraduate Education (currently Professor Herant Katchadourian) as an *ex officio* member of the Senate. The Associate Dean of Humanities and Sciences for Undergraduate Programs (currently Professor Carolyn Lougee) is presently a voting member of the Senate, but will not normally be an *ex officio* member.

7. Annual Report of C-UAFA

The Senate, by unanimous voice vote, accepted the Annual Report for the academic year 1981-82 of the Committee on Undergraduate Admissions and Financial Aids. The report was presented by Professor T.H. van Andel, Chairman of C-UAFA.

In presenting the report, Professor van Andel called attention to the portion of the report that commends highly the "excellence and personal warmth of the entire personnel" who deal with admissions and financial aid.

> We note that not only the admission and aid policy, but also its very personal implementation are at the heart of the quality of the Stanford student body in which we all take delight. Such performance deserves the respect and gratitude of the entire Stanford community, as well as the necessary resources, financial and otherwise, to make the task possible at all.

The Committee also reaffirmed the policy of admitting undergraduate students without regard to their ability to pay although it noted the worsening prospects for outside financial support and the weakening of such need-blind policies in several of the universities with which Stanford is customarily compared.

The success, or yield rate of students (their persistence to graduation) was of interest to the committee as a possible criterion for evaluating the quality of the admissions and aid policy. Persistence rates at Stanford were among the highest for comparable institutions (nearly 95 percent), but limitations of sample size, inadequate data for comparison, and the number of significant variables involved all delay conclusions on this matter until more information becomes available.

In the current year, the committee intends to take a closer look at changing patterns of distribution of students in various disciplines and their impact on growing and shrinking departmental enrollments.

The committee is also concerned about the growing problem for middle-income families in financing education at Stanford, as well as the problem of devising appropriate financial aid plans for those who find the practice of borrowing unacceptable or against cultural ethic.

In the discussion which followed the report, interest in the relationship of yield rate to various disciplines, ability levels, and financial need groups prompted a number of questions which cannot now be answered. Chairman van Andel expressed the hope that more information on these matters will be available after the Committee completes its work during the current year.

The practice of obtaining information on parental occupations for Stanford applicants was questioned as being potentially demaging to truly need-blind admissions, or as unnecessary if it is, in fact, not used. Chairman van Andel reaffirmed that this information in no way enters into admissions decisions, and explained how admissions practices prevent that possibility. Others defended the collection of such data as necessary for monitoring the balance of admissions over time, useful in other regards, and very expensive to obtain at some later date.

8. Proposal for MA in International Policies Studies

After defeating a motion to recommit the proposal to the Committee on Graduate Studies for reconsideration, the Senate, by divided voice vote, approved the proposal to establish an MA program in International Policies Studies to begin this year, 1982-83, and to be reviewed after four years in 1986-87.

Professor Robert Ward outlined the history of the development of this multidisciplinary proposal and discussed its nature and its requirements in language, economics, history, political science, business, and quantitative skills. He emphasized its strong vocational element and its focus on internships with private international businesses, indicating that both business and student interest had been systematically explored.

The discussion which followed the presentation brought both commendations of the proposal and criticism of what some perceived to be inadequate attention to basic philosophical foundations for ethical judgments in policy making, and also in the traditional historical backgrounds which should underlie international dealings with other cultures. These reservations were of serious concern to several members of the Senate. Professor Ward acknowledged that the proposal's sponsors are sensitive to these needs and open to suggestions for improving the program.

There were also comments from the floor about the degree of flexibility already allowed within the program. The hope was expressed that typical students would range beyond the required courses to pursue studies in greater depth in the recommended areas. It is expected that the program will be improved as it develops in the four years before it is to be reviewed.

The Senate also heard a number of reports on which action was neither taken nor sought.

1. Report of the Steering Committee

In the Report of the Steering Committee, Chairman Fetter reminded the Senate that the Autumn Quarter meeting of the Academic Council has been set for 4:15 p.m. on Friday, October 8, 1982 as a special convocation in Dinkelspiel Auditorium. It is to be followed by a wine and cheese reception hosted by the President and the Provost.

The Chairman welcomed the members of the Fifteenth Senate newly seated either as alternates for elected members on sabbatical leave, or as new *ex officio* members. He invited all Senate members to inform the Steering Committee of any items they wish brought before the Senate and announced several items which would come before the Senate at its next meeting, including an interim report from the *Ad Hoc* Committee to Study the Length of Academic Terms, the Annual Report of the Committee on Graduate Studies, and a proposal for a graduate degree program in Medical Information Sciences.

2. Report of the Committee on Committees

The Chairman of the Committee on Committees, Professor Anne Mellor, began her report with a welcome to the new Academic Secretary and a request that the following paragraph be recorded in the minutes of the Senate meeting:

> The Committee on Committees of the Fifteenth Senate concluded by expressing our hearty and deep-felt gratitude to Eric Hutchinson for his perennial good humor; his truly remarkable memory for all committee deeds and doers, past and present; and his untiring and entirely efficient efforts to arrange our schedules, carry out our suggestions, and see to it that our business gets done. When he ends his term of service as Academic Secretary in the autumn, we will miss him sorely and wish him well in every future endeavor.

The Chairman reported that the Committee on Committees of the Fifteenth Senate, whose members include Professors Albert Cohen, Sarah Donaldson, Walter Falcon, Nathaniel Gere, James Yere, and H. Craig Heller, met three times during the summer and again last week. It appointed sixteen faculty members to seven Academic Council committees and nominated sixty-seven faculty members for possible appointment to eight University committees, eleven University panels and eleven Trustee committees. The Preliminary **ROSTERS** have been distributed; the final version of **ROSTERS** will be sent to the printer by late October when the student members and presidential appointments have been determined. It is expected to be available in mid-November.

3. Report of the President

President Donald Kennedy, after welcoming returning colleagues, reported on two matters.

First, he reported on the dispute over indirect cost recovery on research grants from the Department of Health and Human Services. That dispute was apparently resolved September 30 in a manner satisfactory both to the admistration and the universities. The policy earlier advocated by the Department (to pay only 90 percent of the negotiated indirect cost rates) would have cost Stanford, in the 1982-83 fiscal year, $2.2 million in foregone reimbursements for expenses already committed. It now appears the 10 percent cuts will not be implemented. Congress has explicitly directed the payment of full indirect costs and specified that a review of indirect costs be conducted in consultation with universities. Stanford will participate in that review and welcomes it, though it will be a painful process.

The President praised the work of Robert Rosenzweig, Larry Horton, Jacyn Mitchell, Robert Freelan and others in making Stanford a leader in this fight. The Association of American Universities Health Committee, which President Kennedy co-chairs this year, also worked actively on this matter.

He cautioned, however, that the political situation is very volatile and the resolution is still in conference. It could be vetoed by the President. The appropriations process is still under way and won't be complete before the lame duck session—if then. Informal word has come from the Department that there will be full payment of indirect costs for fiscal 1983 but President Kennedy warned that Stanford can't be sure of that until written confirmation is received. Even so, he concluded, things look a lot better than they did even forty-eight hours ago.

The second report item was the strike. President Kennedy expressed his understanding and deep regret for the inconveniences to colleagues, to programs, to departments, and "particularly to those in the important work of residential education." He emphasized his opinion that the administration cannot be held responsible for the strike and cited articles which appeared in the *Daily* on Tuesday September 28, and in the *Campus Report* of Wednesday, September 29, as fair statements of the real history of the negotiations. He reasserted his position that the University began its negotiations from a realistic level and made improvements in its offer so as to indicate clearly its final zone of settlement, intending it to be somewhere in the vicinity of the total compensation established last spring for the various non-unionized groups of University and University Hospital workers. He further noted that there had been a significant reduction in the rate of inflation since those increases were established. An offer at or near those levels, he stated, is clearly all that Stanford's financial capacity will permit.

President Kennedy took exceptions to recent claims that the strike leaders have made major concessions and that the positions of the University and union negotiators are close. The latest union offer involves increases in compensation and benefits for the first two years of a minimum of 24 percent which is, he said, "not in the ballpark." He expressed the view that a significant move by USW is required now to get out of the impasse and reiterated his determination not to damage other constituencies of the University by misallocating funds because of strike pressures.

He questioned the claim of an unfair labor practice as the basis of the strike and also the sincerity of strike leaders in using collective bargaining rather than other tactics to effect a solution.

Following the President's report, he was asked to clarify the administration's position on the charge made against Stanford by the National Labor Relations Board. This

continued on next page

Senate Report/ continued from page 26

charge resulted, President Kennedy said, because the University refused to comply with the union's request two years ago for extremely detailed data on contract and non-union workers employed by Stanford. The University judged the request to be unreasonable, prohibitively expensive to fulfill, and of little utility to the union in the bargaining process. The refusal to comply will ensure judicial review because the Board has no enforcement powers. Courts have dismissed similar charges before, and Stanford insists on judicial review of this charge. In addition, he noted that the union could have called a strike over this charge anytime during the two years it has been at issue. The fact that it has not, and the union's failure to mention the charge in the negotiations now confirms the administration's belief that contract matters, not unfair labor practices, are the true basis of the strike.

Asked why the University doesn't give the information to the union, President Kennedy responded that it's very difficult and expensive to compile, and that giving it will concede a precedent the University doesn't wish to concede. Stanford would rather have a legal test. If the court decrees the University should comply, substantial resources will have to be allocated in order to collect the information.

To the suggestion that a request for information about non-unionized workers doing comparable work was indeed of reasonable utility to the union, President Kennedy responded that, though it would seem so in the abstract, that particular request was not. This matter can be settled either by University compliance to a court order or, if the court decides for Stanford, by negotiation, with the union adjusting its request to suit the University's or the court's criteria for reasonableness.

Other questions were asked about the University's use of the words "final offer" (which seem to imply no flexibility for negotiation), and also about its refusal to concede anything on medical and dental benefits.

President Kennedy responded that final offers are commonly understood to signal some limited financial capacity. Benefits can yet be discussed if the union wishes to reallocate amounts within a total increase between compensation and benefits. He stated his belief that progress can be made if USW makes a significant move approaching the "zone of agrement" indicated by Stanford's last offer.

President Kennedy denied the suggestion that more University resources are going into the strike than would have gone into complying with the union's request for information, especially, he said, since complying would have set the precedent and established a "rolling liability." He also resisted the suggestions that he had been unfair in describing the union's last move as no significant improvement, or that the University's definition of a "reasonable zone" was unilateral. With the slowing of inflation, comparison with the spring quarter level of increases for other university groups defines the zone. The University's offer is in that zone, he said; the union's is a long way from it.

4. Report of the Provost

After some preliminary remarks, the Provost began his report by announcing that Vice-Provost Herant Katchadourian would be on leave Autumn Quarter to complete a book. He also reminded the Senate that there would soon be a Memorial Service for James T. Watkins IV, Professor Emeritus, Political Science, who died recently in France.

Provost Hastorf supported Chairman Fètter's remarks about the October 8th Academic Council meeting in Dinkelspiel Auditorium. He emphasized that he plans to remind the Council of the substantial honors granted to faculty members in 1981-82 and that the seven School Deans will make announcements of special teaching honors awarded to members of their faculties during the past year.

Though not welcoming their reappearance, Provost Hastorf drew attention to the publication in recent newspapers of the first of a new series of Cartter-type" reports, this one ranking leading university departments in Physical and Quantitative Sciences. He commented on how the local newspaper reports were slanted by the allegiances of their writers, and also noted that Stanford's Chemistry Department had been inadvertently omitted from the list printed in *Campus Report*.

The Provost pointed out that for Physical and Quantitative Sciences together, there is a clear "Big Four": Berkeley, Stanford, Harvard, MIT. Excluding the quantitative sciences (Computer Science, Statistics, Mathematics), there is a very big fifth: Cal Tech.

Since these reports continue to appear, Provost Hastorf congratulated our colleagues in these departments for their fine showing. Four more reports will appear, ranking departments in other disciplines. The Provost will comment on those briefly.

Legislation on uncapping the retirement age (the Heinz-Pepper Bill), with no exceptions for educational institutions, will probably be considered seriously by Congress in the near future (though probably not in the present session).

In an unusual event, Professor John Dunlop, Lamont University Professor at Harvard, testified before a Senate Sub-Committee on behalf of both the American Association of University Professors and the Association of American Universities about this bill. Provost Hastorf quoted Professor Dunlop's closing remarks:

> One closing point: At the outset I indicated that several associations, representing higher education institutions, and the American Association of University Professors, representing faculty, were in agreement in seeking a permanent exemption from an uncapping of the mandatory retirement age for tenured faculty and tenured administrators. In other industries I would say simply that labor and management are in agreement on this proposal. I believe this fact should be a serious consideration in the deliberations of the Congress.

The Provost also drew attention to the September 29 issue of the *Chronicle of Higher Education* which has an interesting summary of excerpts of the AAUP report on uncapping the retirement age. The summary statement of that committee is that, with institutions with tenure, uncapping the 70-year retirement age would be decimating in terms of budgetary issues, and/or the bringing in of new faculty, or to the tenure system itself. The provost urged faculty to read this material because there will be serious issues to face if one form of that bill, total uncapping with no exceptions, goes forward.

In the discussion following the Provost's Report, the question was raised about how the AAUP position was arrived at, the point being made that not all of the members of the AAUP concurred with the organization's position. The belief was also stated that there was no cause for panic; that other institutions have uncapped retirement voluntarily and there has been no problem.

President Kennedy added two final points: First, there's an article on the AAUP position by William van Alstyne. There is no suggestion of irregularity. Some members may not agree with the official position, but there is no evidence of anything wrong with the way the decision was made.

Second, it seems politically quite likely that there will be ultimately the passage of something quite like Heinz-Pepper with an exemption that is not an exemption but a temporary (7-8 year) moratorium for institutions with tenure. So that faculty members can begin to plan their own views on this legislation and decide on personal investments, it's only fair for Stanford to emphasize that its capacity to treat the people in the window in a more favorable way than is required under the law was exhausted with the last 5-year window when mandatory retirement was moved to age seventy. Stanford must approach the new legislation with the firm idea that it is not going to be possible to generate special treatment for people in that window. Stanford will continue to use seventy as the retirement age until required by law to do otherwise.

As the meeting drew to a close, a final suggestion was made from the floor that the Steering Committee should schedule reports and proposals from guests at some earlier point in the agenda to avoid unnecessarily long waits for the guests and to ensure the presence of a quorum for action.

There being no Unfinished Business and no New Business being raised, the Senate adjourned on a motion made and seconded at approximately 5:20 p.m.

Clara N. Bush
Academic Secretary

Faculty Senate debates the pros and cons of ending 'retire at 70' rule

continued from page 1

women, and minorities.

"At Stanford, we estimate that there would be a 20 percent decrease in (faculty) openings between 1985 and 1990 if two-thirds of the eligible faculty chose to stay for life," instead of retiring at 70, Kennedy wrote.

"A significant decrease in available appointments will have a disproportionate impact on the large number of women and minorities recruited in recent years. Our data indicate that 62 percent of the women and 40 percent of the minority faculty at our university do not have tenure. These persons comprise about 32 percent of all nontenured faculty at Stanford.

"In the long term, it would be very difficult to maintain a system of tenure without mandatory retirement. We do not have to reach as far back as the McCarthy era to realize that tenure is essential to free inquiry in colleges and universities."

Don't panic

In the Faculty Senate, Prof. Bernard Roth, mechanical engineering, said the University should "get out of the panic mode" on this issue.

"The world has not collapsed where retirement has been uncapped," he said. Especially at an institution like Stanford, eliminating mandatory retirement should be "no problem at all."

In a recent report on "uncapping" retirement age, Committee A of the American Association of University Professors (AAUP) said: "Tenure is not a commitment for the duration of the incumbent's working life, but only until a reasonably late retirement age. . . .It is the tenure commitment that distinguishes the professoriate from other employees. . . .

"The proposal. . .poses a serious threat to academic freedom.

"In addition, uncapping legislation upsets existing contractual relations otherwise thought to be fair within the academic community, upsets the institution's ability to plan, and—far more importantly—imposes a heavy cost upon junior and prospective faculty."

If the legislation is adopted, Hastorf said, "we all face very, very serious issues." He already has discussed it with the Advisory Board, the seven tenured faculty members elected by the Academic Council to consider all faculty appointments.

Roth, former president of the Stanford AAUP chapter, said he and several colleagues "don't hold that there's doom around the corner" if the law passes.

The American Federation of Teachers, whose membership includes 80,000 professors nationally, supports the proposal.

Robert Nielson, assistant to the president of the AFT, told *The Stanford Daily*: "We don't think that tenured college faculty should be singled out from other capable elderly workers.

"An older faculty member's income needs are comparable to a younger scholar's, and his desire to achieve is the same."

At Stanford and elsewhere, faculty salaries tend to increase with age, reflecting experience.

Effect on junior faculty

In its report on "uncapping" retirement age, the AAUP national committee noted that junior faculty must indirectly bear the brunt of higher salaries paid older professors through 1) a reduction in their already low salary levels, 2) further reduction in their already tight promotion prospects, or 3) both.

"In the association's understanding," the committee said, "tenure is not a commitment for the duration of the incumbent's working life but only until a reasonably late retirement age."

When Congress adopted the Age Discrimination Act in 1978, colleges and universities received a four-year exemption permitting mandatory retirement of tenured faculty before age 70. That exemption expired July 1.

Previous studies of faculty retirement policy at Stanford have warned that "uncapping" retirement would have a serious impact on tenure.

What the faculty thinks

A campus survey published in November 1980, showed that nearly all Stanford faculty aged 60 through 65 believe that age 70 or no fixed age is appropriate for mandatory full retirement.

Four out of five faculty in this age group favor individual evaluation every year or every three years past the normal retirement age of 65, the study revealed.

Only one in 10 said there should be no such evaluation. A similar group favored evaluation every five years.

In 1977, a national survey of faculty aged 55 to 62 showed those of the highest scholarly standing and performance were the ones most desirous of late retirement.

"It is emphatically not the 'deadwood' who wish to retire late," according to Profs. Everett Carll Ladd and David D. Palmer of the University of Connecticut, who conducted the national study with Prof. Seymour Martin Lipset, a senior fellow at Stanford's Hoover Institution.

"We find an exceptionally strong association between a vigorous research commitment and a commitment to late retirement," they said. —**Bob Beyers**

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

27284-JB (JCC:1472) STU SERV OFFICER II: Fixed term 12/15/82-12/15/84; principal respon of Asst Dean are recruitment, grad stu programs & genl admin; recruiting Chicano applicants to Stanford's Grad Programs, incl extensive recruiting trips, establishment of Natl network of Chicano faculty administrator contacts, follow-thru w/ potential applicants, assisting depts w/ development of recruitment strategies, prep of recruiting mat'ls; convey concerns & needs of Chicano grad students to the Dean & his staff; prov advice & informa about Univ services; offer counsel about academic & professional matters to grad students incl financial aid; participate in planning, develop't, coord, & evaluation of Affirmative Action Program, etc; QUALIFICATIONS: understanding of grad & prof edu in major res univs & issues relating to edu of Chicanos; advanced degree required; admin exp in post-secondary edu highly desirable; effective commu, oral & written; initiative human sensitivity, organ'l ability, & ability to understand & work w/ others.; C06; $1854-2312.

SLAC

95035-JM (JCC:8940) MISC CLERICAL: Offc Sys Spec; input & format corresp, reports, forms, on-line User Notes, VM Notebooks & VM Memos; develop, institute & maintain a training program for staff on use of various computer terminals; add, modify & delete accts, etc in SPIRES; prep computer sys graphs on monthly basis; asst in testing new sys features; route calls to approp staff; update on-line documentation files (DOCTEXT, INDICES & VTOC using XEDIT); QUALIFICATIONS: typ 55-60; several yrs job-related exp or equiv edu/training; exp interfacing w/ a variety of persons; knowl of English spelling, punctuation, syntax; comprehensive knowl of data processing terminology; ability to use & understand WYLBUR, XEDIT, SCRIPT & TOPDRAW; ability to use VM & SVS; some programming training desirable.; B14; $1440-1593. SLAC

95049-JM (JCC:6680) S&E TECH MECH: TMS Unit: all shifts; assemble ultra vacuum (UHV) chambers, valves & gauges, & test components in a clean room area; prep UHV chambers for pumpdown, bakeout & installation into storage rings; maintain inventories; QUALIFICATIONS: expected to complete vacuum technology course; have good mechanical skills; ability to read engrg drawings; prev related exp; knowl of algebra & trig useful; able to qualify for gov't driver's License.; A28; $1539. SLAC

Nonexempt

33503-PM (JCC:1747) LIBRARY SPEC I: 60%, Mon, Tues, & Wed, 2-11pm; asst in reglstering new borrowers & maintaining in accurate up-to-date file of users; asst in circulation of all lib mat'ls incl Reserves; handle renewals, recalls, notifications, overdues, bills; asst in maintaining an orderly collection thru regular shelf reading & cleaning; prov direct'l & holdings informa during hrs worked before 6pm; after 6pm prov assistance in using collection, verification of holdings & ready reference w/ systematic referral to professional staff of all difficult or unanswered questions; search for missing mat'ls; file cards in main catalog, etc; QUALIFICATIONS: typ 40; Public serv orientation; prov serv to users; ability to stay on your feet & shelve for extended periods & move heavy book trucks; good alphabetic & numeric sorting & filing skills; good telephone commu skills; reliability in attendance; prev lib exp; ready reference sources in med/biological literature desirable; contact: B. Vadeboncoeur, 497-6691 or 497-7198.; B10; $713-748.

25861-PM (JCC:2454) OFFICE ASST. II: Processing of admssns applications; assmble file into finished prodt for committee review; typ letters, some form; label, mail appls & sch'l bulletin; answer phones, must be discreet because of admis'n decision & financ'l matters; computer inputting of appl data; QUALIFICATIONS: typ 50+; college bkground helpful in reading grade/college transcrips; checking appl credentials; assumes heavy pressure during admission peak periods; accuracy very imporant; must like detail; willingness to learn computer inputting; send appl/resume to Dena Landsman, Rm 113, Crown Quad, Law School; B09; $1130-1189.

24210-BP (JCC:2454) OFFICE ASST II: Prep partic-ipants' officials passes & credentials, sample boards for game operation for Football, Basketball, Track & all charge events for Minor Sports; prep ticket sellers' bags, charging out tickets & money, assigning genl admission tickets, etc. by price & color; process ticket applications on computer terminal (no programming) & balance sales to cash received on 10-key adding machine; sell tickets to faculty, staff, students, etc. over counter; QUALIFICATIONS: typ 40; knowl of basic acctg procedures & ability to use 10-key; prev exp on computer terminal helpful; prev exp in ticket sales; good verbal commu skills; able to work accurately w/ cash & prep ticket reports; send appl/resume to Bette Robertson, Ticket Manager, Athletic Dept, Stanford University.; B09; $1130-1189.

27409-BP (JCC:2454) OFFICE ASST II: Alphabetizes, checks in, & files various recommendation forms, transcripts, test scores, & corresp into applicants' folders; opening & distributing incoming & outgoing mail; xeroxing; simple proofreading, etc; able to follow instructions as established in credentials area; QUALIFICATIONS: accuracy highly important; respect for confidentiality required; judgment concerning hand-written names, plus work completed on both high sch'l & college transcripts is essential; send appl/resume to Helen Kmetovic, #236 Old Union Bldg, Stanford University.; B09; $1130-1189.

30966-PM (JCC:2454) OFFICE ASST II: Performs duties in Central Circulation Dept; conducts effective patron interview to determine eligibility for privileges; prov informa regarding loan privileges options; issues lib cards; prov genl informa; collects lib fees & charges for lost & overdue books; takes reservations for Gutenberg Express; oversees & keeps statistics; prep & maint Invalid Card List; prov genl clerical support to Loan Div & Central Circulation Dept; processes records using computer terminal as required; QUALIFICATIONS: typ 50; prev serv exp; good commu skills, both orally & in writing; ability to learn the use of automated sys; ability to learn a variety of offc procedures; prev clerical exp; contact: Bob Johnson, Green Lib, Room 223 (497-3152).; B09; $1130-1189.

36204-BP (JCC:2554) SECRETARY II: Prov sec'l support to Asst & Assoc Deans in Grad Studies & Research; schedule mtgs & make appts; make travel arrangements; prep Univ forms; type corresp & reports; filing; working on large mailings; answer phones; greet visitors; open/distribute mail; QUALIFICATIONS: typ 60; sec'l exp; accurate typing; knowl of English grammar & spelling; knowl or willingness to train on micro-computer type word processor; good interpersonal skills & ability to interact well w/ faculty, staff & students; exp relating to ethnic minorities; no smoking in work area; contact: Jacqueline Peterson, 497-2496.: B11; $1246-1310.

30554-BP (JCC:2562) SECRETARY III: Sec to Asst Dean for Development & Asst Development Officer of Sch'l of Humanities & Science; heavy contact w/ faculty & Univ offcrs, incl President & Provost as well as w/ donors & prospective donors; doing res on donors & prosp donors; editing rough drafts; composing responses to routine inquiries; prep expense reports; handling confidential mat'l in sensitive & mature manner; prov full range of sec'l services; QUALIFICATIONS: excel sec'l skills; accurate typing; proficiency in spelling, grammar, punctuation; familiarity w/ dictation equip't helpful; exp in drafting & editing; knwol of word processor or ability & willingness to learn quickly; Stanford bkground or exp in academic setting highly desirable; send appl/resume to Liz Trujillo, 301 Encina Hall, Stanford, CA 94305,; B14; $1440-1514.

29956-BP (JCC:2562) SECRETARY III: Prov sec'l serv to 2 Chemistry Professors; prep of manuscripts, proposals, corresp; prep grant proposals, develop proposal budgets, admininster res expenditures; maintain schedules; arrange travel; prep requisitions; monitor budgets & prep requisitions for grant accts; use of word processor; QUALIFICATIONS: typ 75; 3-5 yrs of sec'l exp; exp w/ acctg helpful; knowl of SU forms, procedures helpful; knowl of word processor helpful, but willingness to learn a must; good English skills; send appl/resume to D.M. Haskin, Chemistry Department, Mudd 121A.; B14; $1440-1514.

33310-PM (JCC:2588) SECY I-SPEC: 8-4:30; receptionist for Cardiology Div; channel incoming calls to Faculty dir lines & fellow offcs; page as nec; prov phone bkup on 3 lines for admin group & 2 lines for in-patient rep; receive, sort & distribute mail for Div; operate postage meter; typ & mail form letters relat-ing to fellowships; order supplies & maintain inventory; QUALIFICATIONS: typ 50-60; requires accurate typing; ability to typ fr dictaphone tapes; ability to follow instructions; pleasant phone manner, patience; familiarity w/ med terminology preferred; excel English skills nec; requires some editing; contact: Gale Pickering, 497-5635.; B10; $1189-1246.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, Oct. 12, in room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

—Bargaining unit—

33233-PB (JCC:5778) LAB GLASSWARE WASHER: TMS Unit; pick up glassware daily; keeping tissue culture & biochemical glassware separate; machine wash biochemical glassware; keeping glassware for each lab separate; hand-wash large cylinders, homogenizers, plastic tubes & other items too delicate to be washed in machine; acid wash pipettes as needed; bring distilled water to labs as needed; clean large distilled water bottles; process tissue culture glassware according to written protocols which requires compulsive cleanliness; multiple rinses & sterlization procedures; QUALIFICATIONS: able to read & adhere to protocols; keep simple records; be conscientious; have manual dexterity; able to learn to operate dishwasher, autoclaves, etc; learn the principles of sterile tech; no prior exp required.; A11; $5.96.

17991-AW (JCC:6680) S&E TECH MECH: TMS Unit; 7:30-4pm; fabricate & install impedance matching coax connection for Ethernet Commu Net work & maintain same; install coax multipoint sys for SNA commu & maintain same; build & install Decnet commu peripherals enhancements using multiple cable & P.C. connections & equip't; install commu links using Telco standard termination codes, trunk cables & other standard commu protocol procedures & equip't; modify & repair CIT owned/built/leased modems to meet w/ CIT protocols; install links to Gandalf Paxc IV, 11/44, Memorex 1270's IBM 3704 & various other minicomputers; QUALIFICATIONS: skilled in soldering all forms of assorted cable termination proficient in use of hand tools, drill press & oscilloscopes; understand digital & analog transmission; familiar w/ RS-232 Telco color code, coax & network requirements.; A28; $8.88.

30965-PM (JCC:1747) LIBRARY SPEC I: Tue, Wed, Thur, 9-6; Fri, 8-5; Sat, 9-5; during intersession: Mon-Fri, 8-5; performs duties in Art Lib; staffs the circulation desk; pages books; answers informa'l & direct'l requests; enforces visitor & stack-use regulations; checks book bags; filing; shelving books; prep mat'ls for forwarding to bindery; checks in new books & periodicals; searches book catalogs, etc; QUALIFICATIONS: typ 40; atten to detail; good organizational & clerical skills; prev public serv exp required; reading knowl of a Western European lang desirable; contact: Bob Johnson, Green Library, Rm 223 (497-3152).; B10; $1189-1246.

131927-BP (JCC:2194) ACCOUNTING ASST I: Accurately, efficiently & independently prepare for recording & acknowlm't gifts received for Univ; serv as both a resource & as a reference to other resources for gift related inquiries; upon completion of training & as expertise develops, employee will become totally respon for independently performing all tasks accurately & w/in specified time frames; good promotional opportunities; QUALIFICATIONS: typ 35; accurate & rapid use of 10-key adding machine; understanding of/aptitude for genl acctg procedures; legible hand-writing; aptitude to handle large volumes of work under constant pressure; overtime often necessitated by workload fluctuation & monthly, fiscal & calendar yr-end deadlines; send appl/resume to Liz Trujillo, 301 Encina Hall, Stanford Univ.; B10; $1189-1246.

27408-BP (JCC:2446) OFFICE ASST I: Respon for receiving, opening & distributing incoming mail & for sorting outgoing mail into various categories; take outgoing mail to central mail room in same bldg 3 times a day; also helps to prep large outgoing mailings at various times throughout the yr; skills to alphabetize & file credentials for admissions applications; able to type labels w/ names & addresses accurately; respect for confidentiality required; send appl/resume to Helen M. Kmetovic, #236 Old Union, Stanford University.; B07; $1026-1078.

24655-BP (JCC:2596) SECY II-SPEC: 50%; 1-5; prov full range of sec'l serv; typ corresp & tech manuscripts fr longhand & transcription; answer phones; screen & route calls; maintain files; schedule mtgs for supvr; make extensive travel arrangements for supvr, visitors; initiate formalities of appts of foreign visitors; prep purchase requisitions, expense reports, & other forms; compose responses to routine corresp, etc; QUALIFICATIONS: typ 65-70; fast, accurate typing; exp'd tech typist; familiarity w/ SU forms desirable; proficient in English grammar & spelling for careful proofreading; well organized; send appl/resume to Evelyn Boughton, S.G. Mudd, Room 133.; B12; $655-687.

24128-TC (JCC:6810) SOC SCI RES ASST I: 50%; fixed term 11/1/82-8/31/83; Tue, Wed, 8-5; Thur 8-4; research asst to one prof. & the res staff of Social Ecology Lab, Dept of Psychiatry; administer questionnaires to res subjs & prep forms for computer analysis; collect & compile bibliographic mat'ls relevant to ongoing res projs & asst in prep of manuscripts; will make short, local trips in completing these duties; QUALIFICATIONS: BA in soc sci or human sci preferred; familiarity w/ scientific literature search & retrieval tech; exp in data collection w/ psychiatric patients; access to own transportation for short, local trips.; B12; $655-687.

Ph.D. oral exams

TUESDAY, OCTOBER 12

Hal B. Heaton, business, "Corporate Taxation and Leasing Presentation Outline," 2:15 p.m., GSB 243. **Philip M. Wala**, electrical engineering, "Amplitude Companded Sideband Modulation," 4:15 p.m., McCullough 128.

WEDNESDAY, OCTOBER 13

Philip Leslie Varghese, mechanical engineering, "Tunable Infrared Diode Laser Measurements of Spectral Parameters of CO and HCN," 2:15 p.m., Bldg. 540, Room 541.

THURSDAY, OCTOBER 14

Murray W. Hitzman, geology, "The Geology of the Cosmos Hills, Alaska and its Relationship to the Ruby Creek Copper Deposit," 2:15 p.m., 326, Geology Corner, Bldg. 320.

FRIDAY, OCTOBER 15

Manuel Figueroa, education and communication, "Methodological Explorations on Schooling and the Reproduction of the Social Division of Labor: A Case Study in Mexico City, Mexico," 2:15 p.m., e114 Education Bldg. Want to join or form carpool from Sunset Dist., S.F. (near 19th Ave.) to Stanford, T-F, 9-5 or 6. Robert, 753-3860 or ext. 7-4116.

Schools victims of crisis of confidence in government, Weiler contends

"The problems of public education are in large measure not its own, but rather reflect a much wider problem that is endemic to modern societies in general and to this country in particular," says Prof. Hans Weiler of Stanford's Institute for Research on Educational Finance and Governance (IFG).

"The decline of public confidence in education is but a reflection of a much more encompassing and pervasive erosion of confidence in public authority and public institutions, and this general erosion may well 'spill over' into the realm of attitudes toward specific institutions which, like schools, are sponsored and sustained by public authority."

According to Weiler, scholars debate whether the level of cynicism should cause concern about basic support for the American political system.

The dramatic decline in people's trust in the government over the past 20 years seems to reflect a more general orientation toward the state and its institutions, he says, "one which is characterized not only by a conspicuous lack of confidence, but also by serious and increasing doubts as to whether the state is either willing or capable of adequately responding to the needs of society."

The principal finding from a number of opinion polls surveyed by Weiler in a study recently published by IFG is stark and simple. Americans trusting in their government declined consistently and dramatically from 58 percent in 1958 to 19 percent in 1978; those considered "cynical" toward government have increased from 11 percent to 51 percent of the population over the same period.

At the same time, people's confidence in education has shown a consistent decline. In the regular annual Gallup Poll, the American public has graded their schools on a scale from A through F in recent years, and the pattern is clear. Good grades had the advantage over bad grades in 1974 by 16 percentage points, but by 1981, bad grades outweighed good grades by 18 percentage points.

Since other measures of trust, confidence, and satisfaction at a personal and interpersonal level show little if any decline over the years, Weiler concludes that "dissatisfaction and loss of confidence are focused on the state and its institutions, and tend to reflect an increasingly skeptical and disillusioned citizenry in its perception of public authority."

Weiler, a professor of education and political science, is interested in the connection between public confidence in education and trust in public authority. Surveys indicate that concerns over education rank at or near the top in five western nations, and share first place with crime control in the U.S.

"After all," he says, "given the importance of education as the prime societal mechanism not only for the socialization of the young, but also for the allocation of social status and of the rewards that go with it, it seems reasonable to suggest that the state's involvement in sponsoring and sustaining public education is seen as a particularly crucial and central function."

In his research, which is supported by the Spencer Foundation, Weiler argues that public education may well be a particularly likely candidate for sharing the state's problems of credibility and legitimacy. Dissatisfaction with public education may be a reflection as well as a contributing factor to a broader crisis of confidence in public authority.

Hans Weiler

"To be sure, people, especially parents, are bound to be preoccupied over declining SAT scores and vandalism in schools; but the point is that even if SAT scores rose and the vandals started behaving themselves, it would be very unlikely to make much difference in the overall public assessment of the public education enterprise," concludes Weiler.

"It is just not conceivable that, at a time when cynicism about public authority is at an all-time high, and for all we know rising, as central and political an institution as education could bounce back to new heights—or even modest elevations—of public confidence and esteem."

Rental housing

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

HOUSING AVAILABLE

□ **Nov. '82 to Mar. 15 (flex):** SHARE half 4BR/2BA fully furn hse, incl linens, dishes, w/fac. cpl. Bike to campus. No smoking, no pets, child ok. $500/mo + util. Call 326-4316 (morn. or eve).

□ **NOW thru spring qtr.:** 4BR/2BA, den, patio raised bed garden, Mayfield area of Mt. View. 25 min. bike to Stanf., 15 min. by car. $1100/mo, unfurn. Call Barbara (415) 941-5151 or (415) 948-5342.

□ **NOW:** FREE rm & brd for resp female in exchnge for hsekeeping & very limited childcare of 2 elem. sch. age girls. Sep. furn rm. San Carlos w/breath-taking view of bay. Easy walk to Samtrans. Call Dave, (415) 859-5047 (day), (415) 593-2936 (eve, wknd).

□ **Jan. 1 to Sept. 15 '83 (flex):** Fully furn. 4BR/2BA spac. campus hse, view of hills. No pets. $1600/mo, incl. gardener. Call Peter Hammond, 494-0362, or 497-3987 (day).

□ **NOW:** TAHOE DONNER HSE RENTAL. 4BR/3BA hse w/hot tub. Overlook natl forest. Frpl, wd stove. $150/wknd, $375/wk. Call 497-6421 (day), 324-8559 (eve).

□ **NOW:** Woodside. Tranquil 5BR/4½BA hse. Furn. optional. Library, DR, 3 frpl, all appl. kitchen, indry. Pool, cabana, 5-horse barn. 15 min. to Stanf. Lease or lease option. Portola Valley schls. $3000/mo. Call (415) 851-2323.

□ **April thru Sept. '83:** Furn. 3BR/2BA hse in Palo Alto. Frpl, FR, all appl., swim pool w/solar heat, solar hot water. 1 min. to campus, on bus rte. Children fine, smoking not. Call Sladen, 858-0494.

□ **Jan. thru June or July '83:** Fully furn. 4BR/2BA hse, all appl., nr shops, bus, mid-twn Palo Alto. 1.5 mi. to campus. Nonsmokers, lease & dep. req. Lease of car poss. Call Robert Schreiber, 497-1923 (day) or 325-2709.

□ **Beg. Nov. 1 for 1 yr:** Atherton hse, 3BR/2BA, den, frpl, patio in rear yd. Unfurn., carpets, drapes, stove, frig. Call Wells Fargo, 855-7631.

□ **Beg. Oct. 11, '82:** Beautifully renovated 3BR hse to SHARE in old Palo Alto. Frpl., built-ins, fully equip. DR, prefer female, nonsmoker, Stanf. fac. or staff. Call Robbie Weinman, 855-2663 or 326-3497 (eve).

□ **Now:** Gracious Atherton hse. Unfurn, 2BR/2BA, lge LR, sep. DR, frpl., hardwood flrs. Spac. grounds, oaks & redwoods. $1750/mo, incl. pool maint. & gardener. Call 328-7721 (day), 328-2330 (eve).

HOUSING NEEDED

□ **Jan. & Feb. '83:** Single woman would like to hsesit for these 2 mo. Call 854-2658.

□ **Jan. to Mar. '83:** Visit Prof & wife seek 1 or 2 BR furn apt for hse within 1 mi. of campus. Homeowners, nonsmokers, local refs. Call (212) 260-8221, or write: R. Lipsey, 70 E. 10th St, #3A, NYC, 10003.

□ **Jan. to Mar. '83:** Retired cpl seeks furn. 1 or 2 BR apt., condo, or hse. on campus., Palo Alto, Menlo Pk. Close to shops, campus. Pkge deal to incl. car best. Call Dave Marimont, 497-3796 (day), 325-7182 (eve).

□ **Nov. & Dec. '82:** Faculty visitor seeks hsesit or pay modest rent. Dates flex. Will care for pets. Call 327-8160 after 7 pm.

□ **NOW:** Female grad. stud. seeks rm w/lite kitchen priv. for fall qtr., nonsmoker, neat. Finishing MA in Art Hist. $200 to $300/mo. Call Suzanne (415) 365-6274.

□ **Feb. 15 to July 1, '83:** Swedish Post-doc Fellow seeks furn. hse in Stanf. or Berkeley area. EXCHANGE hse in Lund, Sweden as of Jan. 15. Call (415) 851-2345 or write: Dr. Erik Wallin, Sparnogaton 14, 222, 52, Lund, Sweden.

□ **XMAS SEASON:** HSESIT. Fac. mbr Pa. prep sch. seeks hsesit opportunity Stanf. area during holiday break. Call Phil (415) 965-5404 (day) (415) 369-6130 (eve).

□ **Jan. to June '83:** Visit Prof & wife from Oxford, no children, seek 2 or 3 BR furn hse or apt. on or nr. campus. Call (415) 857-9263.

□ **HOUSESITTING:** Established prof. cpl. seeks long term hsesit position. Nonsmokers, no pets, no children, neat, quiet, local ref. avail. Call 326-6425, 328-5344.

□ **Nov. to Mar. '83:** Visit. prof, Chem. Dept., seeks 2-3BR furn. hse or apt on or nr campus. 3 children (10, 18, 20). Call Lydia, 497-3507 (day), or write: Prof. Th. Dorfmuller, Univ. of Bielefeld, Dept. of Chem., POB 8640, 4800 Bielefeld 1, West Germany.

□ **Beg. Oct. '82, long term:** Prof. woman, 34, full-time Stanf. empl., seeks unfurn. 1BR apt. or cottage. Very resp., quiet, neat, stable. No pets or children. Local refs. Call Julia, 497-3811 (day).

□ **Jan. '83 to Aug. '83:** Visit. prof, wife & 2 children (11, 8) seek 2-3BR furn. hse or apt. nr. good public sch., easy commute to Stanf. WILL SWAP 3BR/2BA hse on 2 acres! 10 min. to U. Mass. Amherst. 1 hr to Vermont ski slopes, 1½ hr to Boston. Call collect, John Collura, (413) 253-3287.

Health and safety report

Accidents and Injuries Occurring Sept. 17-30

Cause of accident or injury	Number of incidents	Days Lost
Impact with object	1	0
Other contact caused (crushed)	1	0
Exposure to chemical vapors	1	0
Insect bite	1	0
Lifting	3	10
Radiation exposure	1	0

During the past six months, nearly 70 percent of the accidents or injuries reported to the Department of Health & Safety were caused by impact with objects, falls from same level or height, contact with sharp objects, and improper lifting. A summary of these figures is shown in the table below.

Most Frequent Causes of Injury
January to June 1982

Cause	Number	Percent of All Types of Injuries Reported
Impact with object	28	12%
Fall from same level	21	9%
Fall from height	33	14%
Contact with sharp object	44	19%
Lifting improperly	34	15%
	160	69%

Most of these injuries can be traced to one of two things—unsafe conditions or unsafe acts.

Unsafe conditions can be eliminated through careful planning and periodic inspection of the work environment. If an accident occurs due to unsafe conditions, questions must be asked to determine what the unsafe condition was, and then appropriate action should be taken to correct the condition. For example, consider the four causes of injury mentioned in the paragraph above. Questions to ask with respect to related unsafe conditions might be:

* Are objects precariously placed on top of file cabinets, etc?
* Have the edges of metal shelves been taped or filed smooth?
* Are wet or waxed floors posted for employee safety?
* Do stairs have adequate lighting? Hand rails?
* Is the workspace uncluttered so as to allow proper lifting?

Unsafe acts can be prevented through training in the proper use of equipment and, on an individual level, through greater concentration on the task at hand. Again considering these frequent causes of injury, questions to ask regarding related unsafe acts might be:

* Was the employee reaching for something which was too high?
* Was the employee using a knife or sharp object properly?
* Was the employee's vision obstructed (i.e., by carrying something)?
* Was the employee using a ladder properly?
* Was proper lifting technique being used?

Only by asking questions like these about every accident can you find the actual causes and then take action to prevent similar ones in the future.

Preparedness Week shows how to cope with 'quake danger

Five free public programs are planned at Stanford during Earthquake Preparedness Week, sponsored by the Department of Public Safety Monday through Thursday, Oct. 11-14.

In addition, displays are planned from Wednesday, Oct. 6, through Friday, Oct. 22, in the lobby of Meyer Undergraduate Library and from 11 a.m. to 3 p.m. Monday through thursday, Oct. 11-14, on White Plaza.

Scheduled events Monday include a showing of the film "Earthquake Don'ts, and Do's" starring John Ritter, and a San Diego State University slide show on "Earthquake Safety" at noon in Room 282 of Tresidder Memorial Union.

"Earthquake Hazards in the San Francisco Bay Area" will be discussed by Prof. Robert Kovach, geophysics, at 7:30 p.m. Monday in Geology 320.

Blume Earthquake Engineering Center will hold an open house from 1 to 5 p.m. Tuesday, Oct. 12, in Building 540. Prof. Haresh C. Shah, civil engineering, co-director of the Blume Center, will discuss "Coping with Earthquakes" at 7:30 p.m. Tuesday in Geology 320.

Public Safety Director Marvin Herrington will talk on "Earthquake Preparedness at Stanford" at noon Wednesday and Thursday, Oct. 13-14, in the Meyer Library Forum Room.

In a letter to deans and department heads, President Donald Kennedy said: "It is important for us to maintain a good preparedness program, since the earthquake (danger) at Stanford becomes more severe as additional time elapses."

Kent Peterson, associate vice-president for business and finance, heads a new committee responsible for developing and implementing a program of earthquake preparedness. It includes representatives from the Hospital, SLAC, student residences, risk management, and the Provost's Office. Individuals from Public Safety, Health and Safety, and Facilities and Services also are involved.

Individuals seeking information on how they can prepare their households for possible earthquakes may call the Earthquake Safety hotline at (415) 329-1800.

'Career Faire' to be held on Friday, will feature 80 employers

Despite some indications of a sagging economy, more than 80 corporations, non-profit organizations, and government agencies will be sending representatives to the fifth annual Stanford Career Faire, on Friday, Oct. 8, in White Plaza.

"We changed the name this year (from Job Faire) for several reasons," said Deborah Duncan, assistant to the director of the Career Planning and Placement Center." 'Career Faire' reflects more accurately the focus of the day.

"It is intended to be an opportunity for students to talk informally with employer representatives about careers in a variety of organizations. We've also introduced five special tables at the faire this year—advertising, entrepreneurship, health, law, and the media. Panels at these booths will represent several organizations in career fields of considerable interest to Stanford students.

"And finally, we were concerned that some employers would be reluctant to attend a 'job faire' if their organization had no immediate openings to fill.

"We've been extremely pleased with the employers' response," noted Melinda Kaewert, supervisor of recruitment activities at the CPPC and coordinator of the program with Duncan. "We did lose some organizations that have come in the past, including a few banks and high-technology companies. But other recruiters tell us that they don't want to miss out on the Stanford faire, even if they don't now anticipate hiring in the near future."

There are more organizations interested in talking with liberal arts students at this year's faire: six of the Big Eight accounting firms will be represented, as well as the Bank of America, United Airlines, Apple Computer, and the Peace Corps.

The Alliance of Motion Picture and Television Producers (offering an assistant director's training program), Genentech, and the Environmental Intern Program should again attract a large number of students to their booths. And Atari is expected to be an especially popular newcomer to the faire.

Incoming Career Planning and Placement Center Director Christopher Shinkman noted that the program enjoys a reputation among college recruiters as being one of the best in the country.

"Continuing interest in Stanford students, even in a difficult economy, reflects the very considerable quality and energy of the student body. The Stanford Career Faire is an excellent way to kick off the CPPC's career-planning and recruiting year.

Showcase of what campus can offer

Information and entertainment are the themes of Harvest '82, a showcase of student and University organizations, from noon to midnight Friday, Oct. 15, on Stanford's campus.

The event, sponsored by the Associated Students, Tresidder, and the Office of Student Activities (OSA), is designed to introduce the Stanford community to the various programs and services offered by University and student groups.

The program features an informational faire in White Plaza from noon to 3 p.m. with booths in which organizations can display information and discuss their programs with members of the public.

Why banks offer less for more money

Wells Fargo Bank, located in Tresidder Memorial Union, still offers low cost checking services despite the recent discontinuance of the student checking account program. Effective Sept. 15, 1982, all student checking accounts at Wells Fargo were automatically converted to Special Checking Accounts.

This is part of a trend seen in banks across the country. In a comparison of 10 banks offering similar services in this area, only one had retained the student checking account program.

This discontinuance of the accounts is part of the move to higher fees and declining service in the banking industry. These changes have been brought on by inflation, increased competition and deregulation. Also contributing to the problem is the flight of money from banks to the high-paying money market funds. In order to make up for the loss of funds and increasing costs, banks have begun to charge more for their services.

If students want to keep service charges to a minimum they may want to use the Wells Fargo Express Stop more often to get cash, since this service offers a lower fee and 24-hour convenience.

Those with questions may contact the Wells Fargo Bank in Tresidder Union at 855-7601.

Eco, Gabbrigiani to speak this week

Elio Gabbugiani, the mayor of Florence, will talk on "P.C.I. and International Politics" at 3 p.m., Thursday, Oct. 7 at Casa Italiana. A question period and reception will follow.

Umberto Eco, a well-known author who publishes in English and Italian, will lecture on "Fish and Buttons: What is Semiotics About?" at 8 p.m., Wednesday, Oct. 6 in Room 2 of the History Corner. A reception will follow.

Both discussions are sponsored by Casa Italiana and the Italian Cultural Institute of San Francisco. Eco's lecture is also sponsored by several other Stanford organizations.

Contact Leda Mussio at 7-4185 for further information.

The way it was....

75 YEARS AGO (1907)

Encina men were asked to pay their room rents in cash only in order for the University to pay its employees' salaries, to whom checks would be of little value during the banking holiday declared by the Governor. Palo Alto and Mayfield banks were refusing to cash checks on outside institutions during the stringency of the New York money market. The interest offered in the large commercial centers was so high that money was being withdrawn from local banks and sent to the large cities.

Several members of the Stanford Faculty applied to purchase lots in the new town of Los Altos, with a view to building homes as soon as the interurban electric line could be extended from the campus, making a ten-minute service.

U.S. Vice-President Charles W. Fairbanks addressed the first student body assembly of the year. He was accompanied by Governor Gillett of California and U.S. Senator Flint. He did not discuss the political reasons which had brought him to the Coast but did praise Stanford for its recovery from the earthquake. The entire party took lunch at the Phi Gamma Delta fraternity house.

As a result of the trip to the Antipodes by President Jordan and Instructor P.J. Treat of the History Department, a large number of volumes dealing with Australia and New Zealand were donated to the University Library. Notable among the gifts were 600 volumes from Thomas Welton Stanford, 500 volumes from Herbert C. Hoover, '95, of London and 125 volumes from Deane P. Mitchell, '96, of Melbourne.

50 YEARS AGO (1932)

Registration decreased by nine percent from the previous year for which the Depression was blamed. Some universities on the Coast suffered greater decreases. Oregon State lost 29 percent. Oregon 18 percent. Washington 10 percent and Washington State 12 percent. Cal and UCLA experienced no decreases.

The Board of Athletic Control sold its 300 sheep to Theodore Hoover, dean of the School of Engineering, who had a sheep ranch on the coast. From then onward Stanford's athletic fields were to be clipped by lawn tractors in accordance with the machine age. The chief reason for the change was the illness of Billy McClintock, the Scottish ancient who had herded the University's sheep in Highland style for 30 years.

Revolting against what they termed the "empty phrases" of the two major political parties, a Stanford Norman Thomas for President Club was formed in accordance with Dr. Wilbur's expressed wish that students take an increased interest in politics. The cooperation of non-Socialists was welcomed. Track star Abe Hables organized a Hoover for President Club. No group had yet been formed to aid in the election of Governor Franklin Roosevelt. The results of a straw vote on campus were: President Hoover 828, Governor Roosevelt 251, Norman Thomas 216, Upshaw (Prohibition) 3, and Foster (Communist) 6.

25 YEARS AGO (1957)

1,157 members of the Class of 1961 entered the University and were described by President Wallace Sterling as the most selective class yet at Stanford.

Undergoing complete reorganization, the School of Mineral Sciences established five new departments—geology, geophysics, petroleum engineering, metallurgical engineering and mineral engineering. Dean of the School Charles F. Parks, Jr., named Ben M. Page to head the geology department.

On the recommendation of former President Herbert Hoover the name of the Hoover Institute and Library on War, Revolution and Peace was changed to the Hoover Institution on War, Revolution and Peace to emphasize the dynamic character of its work. About 73,000 persons had toured the building and its tower during the previous year. Among its recent acquisitions were the first documents from Peking released by the Chinese Communists, prints of German Foreign Office documents covering the years 1937-1945 and Palestinian Arab propaganda materials presented by the Mufti of Jerusalem.

Stanford Research Institute, using the Doppler effect, was leading the field of institutions in the U.S. in attempts to establish the orbit of the Russian satellite, "Sputnik." Stanford scientists were trying to get radio reflections from the satellite with the giant radar antenna in the hills behind the campus.

The Stanford Historical Society

I-Center films begin with Japan

The fifth year of the International Center's Other Cultures film series will begin tomorrow (Thursday, Oct. 7) with a showing of a six-part film series, "The Human Face of Japan."

The series on Japan, premiering in the Bay Area, shows the character of the nation through the lives of a few Japanese people.

Tomorrow night's films will be "Lifetime Employment," "Tomorrow and Yesterday," and "Raw Fish and Pickle."

"Lifetime Employment" examines the nature of industry in Japan through the life of a worker at a Mazda assembly plant.

"Tomorrow and Yesterday" contrasts tradition with the modern world as it affects child rearing, social relations and spiritual training.

"Raw Fish and Pickle" explores life in Iwate, a rural province, by examining the lives of the vice-Governor and a fisherman.

The remaining films, "The Career Escalator," "A Working Couple," and "The Rice Ladle," will be shown as part of next Thursday's (Oct. 14) program.

The Other Cultures films series is an ongoing weekly film program featuring informative and entertaining films on different aspects of the international community. Admission to all films is free, however, a 75 cent donation is requested at the door. Show time is 7:30 p.m.

For more information about the Other Cultures film series or any other program at the I-Center, call 497-2981.

Nigerian to speak I-Center lunch

Gafar Adamola Olaniyan, a Nigerian journalist, will be the featured speaker at the International Center's Tuesday Luncheon-Lecturer for October 12.

Olaniyan, the night editor for the Nigerian Herald in Ilorin, Nigeria, and a Professional Journalism Fellow at Stanford will speak on "The Legacy of Colonialism from an African Point of View."

Olaniyan's lecture will counterpoint Prof. David Abernethy's talk on the colonial legacy on October 5. Olaniyan's discussion will focus on the specific problems facing Africa in the post-colonial era.

Tickets for the luncheon are $2.50 and limited to 40. Sales begin one week prior to the event at the International Center. Brown baggers are welcome at no charge.

The Tuesday Luncheon-Lecturer series this quarter will concentrate on the effects of colonialism throughout the world.

For more information, phone the I-Center at 497-1831.

Staffers go aerobic

The Stanford Staffers will be led in aerobic dance by Barbara Frey of the Health Improvement Program (HIP) for their noon meeting on Wednesday, Oct. 13.

The Staffers organization and meetings are open to all Stanford members, male and female. Those who attend the Oct. 13 meeting should wear comfortable clothes.

Meeting place is at Tresidder Upper Deck or, in case of rain, the Chemical Engineering Gazebo.

U-Zulu Dance Theater performs the dances and music of South African peoples at 8 p.m. Saturday, Oct. 16, in Dinkelspiel Auditorium

U-Zulu Dance Theater to present master class, performance next week

The U-Zulu Dance Theater of South Africa will perform at 8 p.m. Saturday, Oct. 16, in Dinkelspiel Auditorium at Stanford.

Tickets for the event, which is sponsored by the Committee on Black Performing Arts, are on sale at the Tresidder ticket office. General admission is $7 in advance, $7.50 at the door; students and seniors $5 in advance and $5.50 at the door.

The troupe utilized traditional songs and dances from the Zulu, Xohaf, Shagaan, and Sohoto peoples to present a dance-drama about a young man's trek from his village to the teeming Johannesburg metropolis. The pride as well as the pain of black life in South Africa come alive through a series of powerful dances, moving songs, and vibrant rhythms.

The company consists of four men and three women, all of whom were born and raised in South Africa. They have been careful to maintain the authenticity of their presentation, so that the style of their dances is identical to that performed on ceremonial occasions in South Africa. The costume designs are representative of clothing worn by Zulu warriors over 400 years ago.

Master class

Members of the troupe will also conduct a master class at 9:30 a.m. Saturday, Oct. 16, in the Clubhouse (Old Union) on campus. They will teach traditional dance movements as well as the songs which usually accompany them.

Tickets for the master class alone are $3 and will be sold at registration which begins at 9 a.m. Combined master class and performance tickets are also available at $6 for students and $8 general.

For further information call 497-4317 or 497-3781.

Y gives overview of martial arts

"Self-Defense for Women: A Range of Options," is an evening of brief demonstrations of a variety of martial arts to be presented by the Stanford YWCA at 7:30 p.m., Tuesday, October 5, at Roble Gym dance studio.

Observers will have the opportunity to compare the special characteristics of such diverse self-defense strategies as aikido, karate, and judo.

The program is offered to the public free of charge, as a part of a series of programs for Rape Awareness Week.

Music Guild's "Learn To Listen" series begins

Enriching appreciation and understanding of music is the theme for the 1982-1983 "Learning To Listen" lecture series sponsored by the Music Guild at Stanford.

The series of four lectures by Stanford music professors will be held at 8 p.m. Tuesdays in Annenberg Auditorium on campus, starting Oct. 12.

Emeritus Prof. Wolfgang Kuhn will speak on "Creative Listening." A reception will follow.

"An Introduction to Mahler: Does Music Tell a Story?" will be the topic of Prof. George Houle on Oct. 19.

Prof. Albert Cohen will talk on "Spanish music in the Golden Age-16th Century" on Feb. 1. A reception will follow.

"Computers and Music: A Rich Interaction" will be discussed by Prof. John Chowning on Feb. 8.

The series is open to the public. Tickets will be available at the door or from The Music Guild at Stanford. Call (415)497-1780 for further information.

Lipset to chair roundtable talk on representation

Prof. Seymour Martin Lipset of Stanford University, senior fellow at the Hoover Institution, will chair an international roundtable of political scientists on "Does representation still work? Citizens, parliaments, and the state in Western democracies" at 4:15 p.m. Thursday, Oct. 14, in Annenberg Auditorium. Sponsored by Stanford's Committee on Western European Studies and the Center for Research in International Studies, the roundtable will include:

Klaus von Beyme of the University of Heidelberg (Germany), newly elected president of the International Political Science Association and a visiting professor at Stanford in 1978-79;

Dennis Kavanagh, chairman of the Department of Politics at the University of Nottingham (England) and an authority on parliamentary politics in Western Europe and the U.S.;

Johan Olsen of the University of Bergen (Norway), an expert on the organization of representation in government; Leo Panitch (Carlton University, Canada), a specialist on the politics of labor relations in Western democracies; and

Alan Wolfe (Queens College, C.U.N.Y.), author of "The Limits of Legitimacy: Political Contradictions of Contemporary Capitalism."

The panelists, together with some 20 other scholars from Western Europe and North America, will be on campus for a week-long workshop on "Representation and the State," which is chaired by Prof. Hans N. Weiler of Stanford and funded by a grant from the Volkswagen Foundation.

Roble Pool open

Roble Pool is open again, after its scheduled opening last week was postponed because the strike delayed necessary maintenance.

Pianist Bella Davidovich to play Haydn, Prokofiev, Chopin in season opener

Soviet-emigre pianist Bella Davidovich will open the Lively Arts at Stanford's 1982-83 season in the newly refurbished Memorial Auditorium at 8 p.m. Friday, October 15.

Davidovich's program will include: Haydn's "Sonata No. 21 in F Major, HOB. XVI/23" and "Sonata No. 7 in D Major, HOB. XVI/37"; Prokofiev's "Selections from Romeo and Juliet"; and Chopin's "Variations Brillantes in B Major, Op. 12," "Nocturne in E Major, Op. 62, No. 2," "Barcarolle in F sharp Major, Op. 60," "Three Mazurkas," and "Ballade No. 3 in A flat Major, Op. 47."

Davidovich emigrated from the Soviet Union to the U.S. in 1978, following her son's emigration to study at the Juilliard School in 1977.

Within one month after settling in New York with her mother, sister and son, violinist Dimitri Sitkovetsky, Davidovich set out on a European tour. The tour included concerts in Amsterdam, Sweden, Switzerland, and recitals in Antwerp and Munich.

In October, 1979, Davidovich made her recital debut at Carnegie Hall, which marked the beginning of her career in the U.S.

In the 1982-83 season, Davidovich will appear four times with the New York Philharmonic and with the Atlanta, Dallas, Toronto, Vancouver, and Vienna orchestras. She will make her debut with the National Symphony (Rostropovich conducting), the Los Angeles and the Berlin Philharmonic. In addition, she will perform with the Israel Philharmonic (Tennstedt conducting) and will also appear in recital at Carnegie Hall and in Berlin, Brussels, Paris, Stockholm and Amsterdam.

Born into a family of musicians in Baku, Russia, Davidovich showed her rich musical talent at the age of three and began formal training at the age of six. A child prodigy, she performed a Beethoven concerto at age nine and a Schumann concerto at age 11.

Davidovich entered the Moscow Conservatory at age 18 and studied with Professors Igumnov and Flier. Three years later, she won the first prize in the 1949 Chopin Competition in Warsaw (the last Russian to be so honored). Davidovich appeared with every major Russian conductor and performed as soloist with the Leningrad Philharmonic for 28 consecutive seasons.

Davidovich records exclusively for Philips Records. Her latest recording of Chopin's Four Ballades will be released sometime this fall.

Davidovich has recently been appointed to the faculty at the Juilliard School in New York City.

For ticket information call Tresidder Ticket Office, (415) 497-4317.

Bella Davidovich

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next Calendar deadline is Wed., Oct. 6 to cover the week of Mon., Oct. 18 through Sun., Oct. 24.

LATE ANNOUNCEMENTS

Fri., Oct. 8. Music Dept. Concert: Alma Trio & Guests. Andor Toth, violin; Gabor Rejto, cello; Adolph Baller, piano. Beethoven—Trio in D Major, op. 70, No. 1 "Ghost"; Kodaly—Duo for violin and cello, op. 7; Dvorak—Quintet in A Major, op. 81. 8 p.m. Dinkelspiel Aud. $4/$2.

Sat., Oct. 9. Music Dept. Master Class: Eric Hoover, flute, visiting from Arizona State Univ. 2 p.m. Annenberg Aud. Free. Music Dept. Concert: Flute recital by Eric Hoover. 8 p.m. Annenberg Aud. Free.

Sun., Oct. 10. Martin Stoner, violin, with Artis Wodehouse, piano. Vitali—Chaconne; Beethoven—Sonata No. 5 in F Major, op. 24, "Spring"; Brahms—Sonata No. 3 in D minor, op. 108. 2:30 p.m. Tresidder Lounge. Free.

Music Dept. Concert: Diana Peterson, flute, with Jeff Williams, piano. Works by Handel, Mozart, Hindemith, Damase, Bartok. 8 p.m. Tresidder Lounge. Free.

MONDAY, OCTOBER 11

Men's and Women's Cross Country: Stanford High School Invitational. 11 a.m. Stanford Golf Course.

Biological Sciences Dept. Seminar: "Natural Transplantations in Colonial Protochordates and the Evolution of Vertebrate Immunity" with Dr. Virginia Scofield, SUMC. 4 p.m. Herrin Lab, Room t175. Open to the public.

Fulbright Scholarship Deadline: Applications for graduate Fulbright grants are due at 4 p.m. at the Overseas Resource Center, 2nd floor, I-Center. For further information, please call 497-0856.

Numerical Analysis Seminars: "The Use of the Computer in the Asymptotic Expansions of Integrals" with Gerald Hedstrom, Lawrence Livermore Laboratory. 4:15 p.m. Math 380C.

Energy Policy Seminar: "Post-Reagan Energy Planning" by Denis Hayes, UC-Santa Cruz. 4:15 p.m. Skilling Aud. Public invited.

Stanford Film Society: "Four Hundred Blows." 7 p.m. Kresge Aud. $1.50.

Radioscience Seminars: "Acceleration of Particles at the Earth's Bow Shock" with Kinsey Anderson, UC-Berkeley. 4:15 p.m. McCullough 127.

TUESDAY, OCTOBER 12

I-Center Tuesday Lecture/Lunch Series: "The Legacy of Colonialism from an African Perspective" by Gafar Adamola Olaniyan, editor, *Nigerian Herald*. Noon. I-Center. $2.50 includes lunch. Brown baggers also welcome.

Fluid Mechanics Seminar: "Skin Friction Measurements with a Nonintensive Laser Interferameter" with Daryl Manson, NASA-Ames Research Center. 4:15 p.m. Skilling Aud.

Communications Design Seminar: "Amplitude Companded Sideband (ACSB) in Mobile Radio" with Philip Wala, S.U. 4:15 p.m. McCullough 128.

Music Guild "Learning to Listen" Lecture: "Creative Listening" by Prof. Wolfgang Kuhn, Music Dept. 8 p.m. Annenberg Aud. $4 general, $3 Music Guild members, $2 students and seniors.

WEDNESDAY, OCTOBER 13

CROW Women at the Top Lecture Series: By Margaret Burbidge, professor of astronomy, UC-San Diego. Noon. Terman Aud. Open to all.

UCCM Lunch Discussion: "The U.S. Economy and Third World Employment" with Dick Solis. Noon. Zapata (Stern Hall) dining room. Bring bag lunch or arrange to eat at Zapata. Directed reading credit available.

Varsity Soccer: Vs. Santa Clara Univ. 2 p.m. Maloney Field.

Field Hockey: Vs. Chico State. 3 p.m. Roble Field.

Electronics in Medicine Seminar: "Biological Acoustic Microscopy" with John Hildebrand, Applied Physics Dept. 4:15 p.m. McCullough 134.

Colloquium of the Dept. of Chemical Engineering: "Fluidized Bed Pyrolysis of Bitumen Impregnated Sandstone" with Prof. F. V. Hanson, Univ. of Utah. 4:15 p.m. Chemical Engineering Conference Room.

Women's Volleyball: Vs. UC-Berkeley. 7:30 p.m. Maples Pavilion.

THURSDAY, OCTOBER 14

Western European Studies Symposium: "Does Representation Still Work?: Citizens and the State in Western Democracy." With speakers Klaus von Beime, Dennis Kavanagh, Alan Wolfe, Leo Panitch, Johan Olsen. Chairman is Seymour Martin Lipset. 4:15 p.m. Annenberg Aud. Public cordially invited.

Solid Mechanics Seminar: "Non-Specular Reflection from Layered Media" with Prof. David Bogy, UC-Berkeley. 4:15 p.m. Skilling Aud.

I-Center Other Cultures Film Series: More segments of "The Human Face of Japan." "The Career Escalator" features a student and a senior executive; "A Working Couple" shows the life of a clerk and his shopkeeper wife; "The Rice Ladle" contrasts traditional and contemporary women's roles. 7:30 p.m. I-Center. 75 cent donation at the door.

FRIDAY, OCTOBER 15

International Student I.D. Card Scholarship Deadline: Applications for travel grants for research projects or volunteer work in developing countries are due at the Overseas Resource Center on the 2nd floor of the I-Center. Undergraduate applications will be given preference. Further information at 497-0856.

Women's Golf: Vs. San Jose State and Sacramento State. Noon. Stanford Golf Course.

Biological Sciences Dept./Developmental Biology Training Program Special Seminar: "Immunocytochemical and Ultrastructural Studies of Nerve Fiber Formation in *vitro*" with Dr. Paul Letourneau, Univ. of Minnesota. Noon. Herrin Lab., Room T-175. Open to the public.

Applied Mathematics Lectures: "The zero dispersion limit of the KdV equation" by Prof. Stephanos Venakides, Mathematics Dept. 3:15 p.m. Room 380C (Math Corner Basement).

Materials Science & Engineering Dept. Colloquium: "Materials for Fluidized Bed Combustors" with Dr. J. Stringer, EPRI. 3:30 p.m. Peterson Laboratory, Room 550A.

Water Polo: Vs. Long Beach State. 3 p.m. deGuerre Pool.

The Lively Arts at Stanford: Bella Davidovich, piano. Haydn: Sonata No. 21 in F Major, Sonata No. 7 in D Major; Prokofiev: Selections from Romeo and Juliet; Chopin: Variations Brillantes in B Major, Op. 12, Nocturne in E Major, Op. 62, No. 2, Barcarolle in F sharp Major, Op. 60, Three Mazurkas; Ballade No. 3 in A flat Major, Op. 47. 8 p.m. Memorial Aud. $11.50, $10.50, $9.50, $8.50; students $3 off these prices.

STARTS Great Directors Film Series: "Days of Wrath" plus short, "Vampyr" by Danish director Carl Dreyer. 8 p.m. Geology Corner, Room 380. $3.75 general, $2.75 students. Reception follows sponsored by the Grad. Students Association.

Archaeological Institute of America Lecture: "Flint and Obsidian, Tools and Trade" by Curtis Runnels, S.U. 8:15 p.m. Room 370 (opposite the Physics Tank). Guests welcome. Refreshments. Please contribute to the housing and entertainment of our speakers.

SATURDAY, OCTOBER 16

Water Polo: Vs. USC. 11 a.m. deGuerre Pool.

Field Hockey: Vs. San Jose State. 11 a.m., 2:30 p.m. Roble Field.

Varsity Football: Vs. USC. 1:30 p.m. Stanford Stadium. Ticket information at 497-1021.

SUNDAY, OCTOBER 17

University Public Worship: Student Worship Service, 8:30 a.m.; Wendy Smith, assoc. dean of the chapel, 11 a.m.; Catholic Mass, 4:30 p.m.; Communion in Memorial Church Round Room, 6 p.m.

ASSU Sunday Flicks: "Cat People." 7 & 9:30 p.m. Memorial Aud. $1.50.

EXHIBITS

The Stanford Museum is closed until the strike is resolved. After that, there will be **Paul Harris—Still Life**. Through January 2.

The Stanford Art Gallery is also closed. After the strike is resolved, there will be **Venice in the 18th Century**. Paintings, drawings, prints and decorative arts. Through December 19.

The Map as Landscape. Familiar and new aspects of Western landscapes by Donna Van Dijk. Reception, Fri., Oct. 8, 5-7 p.m. Bechtel International Center. Month of October.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through November.

Thirty Miles from Stanford. Photographs by Paul Berger. Tresidder 2nd floor gallery. Month of October.

Paintings on Canvas by David Cusic. Coffee House Gallery. Month of October.

CAMPUS REPORT

Volume XV, Number 4 | A publication for Stanford University faculty & staff | October 13, 1982

420-100 vote ends longest campus strike

United Stanford Workers Saturday, Oct. 9, voted 420 to 100 to return to work, ending the longest strike in Stanford history.

The new three-year contract calls for wage and step increases totaling 24.5 percent, with a cost of living escalator in the third year.

Michael Baratz, executive secretary of Local 715, Service Employees International Union, AFL-CIO, said: "The vote was to return to work. The agreement is ratified.

"Nobody accepts this proposal in any sense of the word as fair or just.

"The University continued to bargain in bad faith, to lie, to not provide justification, to continue doing what they had done to the end.

"This was a vote to go back to work, nothing else. . .I'll be back Monday dealing with Stanford University again. We have a hospital election coming up, and we'll have to deal with the trash that gets put out there. We'll take that one on, too."

Stanford President Donald Kennedy said: "We're very happy to welcome the Stanford workers back and look positively toward the future."

More than 800 went on strike Sept. 10.

continued on page 4

Things were a little different for scores of bicyclers this week. As usual, they went through stop signs in droves, and Stanford police officers flagged them down for tickets.

Willow Road link sought to El Camino

The Stanford Board of Trustees Tuesday, Oct. 12, approved "in principle" an administration proposal to extend Willow Road across University lands from Arboretum Rd. to El Camino Real in Palo Alto.

William Massy, vice-president for business and finance, said that the Board approved a study of ways to finance and construct a two-lane road along the western edge of the Stanford Shopping Center.

The extension would be built by Stanford at its cost and would end at El Camino Real, Massy said.

Massy gave several reasons for the recommendation to the board.

"More than 5,000 cars a day are now using the Shopping Center parking lot as a through route to El Camino Real, and many others use campus roads such as Palm Drive, Galvez, and Arboretum. The situation that results is dangerous, inefficient, and burdensome. This is, of and by itself, sufficient reason to want to build the extension."

Council hears Kennedy on faculty outlook

"Uncapping" retirement poses a major threat to Stanford's very successful practice of appointing young faculty with good opportunities for tenure, President Donald Kennedy told the fall quarter meeting of the Academic Council Friday, Oct. 8. Nearly 200 attended.

If legislation removing the present practice of mandatory retirement at age 70 passes next year with no exemption for faculties, "every major research university in this country will have to undertake an agonizing review of its tenure policies," Kennedy warned. *(See text, p.8.)*

"The almost certain result will be the substitution of something else—likely a term contract—for appointments without limit of time.

"A grace period of seven or eight years, which seems a likely compromise, would allow us some opportunity for finding new ways of living with the situation while we continue to require retirement at age 70.

"But at best we will be significantly worse off. And even with no new legislation whatsoever, the effects of the age 70 rule and of economic stagnation will cause the average age of our faculty to continue to rise."

Reduced opportunities for junior level faculty is "a significant impediment to progress" in affirmative action, he noted. "Last year one third of the 68 new appointments to the Academic Council were women. In the School of Humanities and Sciences, nearly half the new appointments and more than half the promotions to tenure went to women.

"Overall, it was the most successful year in Stanford's history in increasing the number of tenured women and in appointing new women to the faculty. There is still much work to do, however; only 117 of Stanford's 1,270 Academic Council members are women, and only 48 of the 836 tenured faculty.

"Our success with ethnic minority groups was less encouraging; but still, 15 percent of the new total Academic Council appointments went to members of minority groups. The School of Humanities and Sciences had an especially strong record, with four new minority group faculty appointed.

During the past 10 years there has been an "imposing improvement" in the caliber of Stanford's faculty, Kennedy noted. Membership in the major academies has more than doubled since 1971.

CIR urges fewer proxy votes

To become more effective as an ethical investor, Stanford should be more selective in voting on stock proxy issues, the Commission on Investment Responsibility believes.

In a unanimous report to the Board of Trustees, the advisory group of faculty, students, staff and alumni makes these recommendations:

1) Trustees normally should not vote any shareholder proxy involving social issues;

2) The commission should consider allegations of substantial social injury resulting from corporate behavior only by majority vote;

3) After research, study and deliberation, any recommendations for action by the trustees should be made only by two-thirds vote of the commission, or eight of its 12 members; and

4) The recommendations may call for voting Stanford's shares, making representation to management, divestment, or any other action the commission regards as appropriate. *(See text, p. 15.)*

Last year, the commission recommended a one year moratorium on stock proxy votes, saying present practices are "too hurried and too limited to do justice to the issues involved." A majority said "as a method of influencing corporate behavior, the proxy process seems very weak indeed."

Prof. Alexander Dallin of the History Department headed the commission study during the one-year moratorium. The

Nine receive Pew support

Nine humanities scholars at Stanford have received Pew Foundation grants for support at critical points in their work, Humanities and Sciences Dean Norman K. Wessells has announced.

Recipients and their scholarly interests are:

Arnold Davidson, philosophy, researching ways in which psychiatric diseases were classified in the 19th-century;

Lewis Spitz, history, continuing study of Luther and German humanism;

Arnold Rampersad, English, completing biography of Langston Hughes, a black American writer;

Gregory Freidin, Slavic languages and literatures, continue investigation of poetry of Osip Mandelstam;

Suzanne Lewis, art, study medieval in illustrations of biblical apocalypse manuscripts;

Stephen Ferruolo, history, study relationship of Pope Innocent III and St. Francis of Assisi;

Peter Stanksy, history, study English culture in World War II;

William Leben, linguistics, Study of Chadic intonation systems (involves tone levels); and

John Felstiner, English, study of poetry, in all different languages, that grew out of the Holocaust.

The grants, amounting to several thousand dollars each, were awarded by the School for projects to be conducted in the first nine months of calendar 1983. They may be used for such purposes as supplementing a sabbatical leave; supporting travel to a library, archive, museum, or other important center of learning; or providing other forms of research assistance needed by a faculty member after other funding sources have been exhausted.

The Pew Foundation grant to the School will support about 10 awards annually for the next five years. An advisory committee on the selection of recipients includes Profs. Michael Bratman, philosophy, Carl Degler, history, and Albert Elsen, art, with Profs. William Chace, English, and Albert Gelpi, English, serving ex officio. Chace is associate dean of humanities and sciences; Gelpi is associate dean of the Graduate Division. The next deadline for applications is May 1.

Susan Gould administers GSB program

Susan B. Gould, 45, secretary and treasurer of MJB Co., San Francisco, has been appointed administrative director of the Public Management Program at Stanford's Graduate School of Business, effective September 13.

She replaces Jan Orloff, who has joined Planned Parenthood International.

Gould, who received an MBA degree in public management from Stanford in 1977, joined MJB in 1980 as assistant treasurer. Prior to that, she was director of administration and development for the San Francisco Conservatory of Music from 1977 to 1980, where, among other things, she was instrumental in the Conservatory's sponsorship of fundraising events including the Bay Bridge Run and the "Sing-It-Yourself-Messiah," a popular sing-along of Handel.

Gould returned to studies at Stanford after raising three children. She was for eight years a member of the board of trustees of the Las Lomitas School District in Menlo Park, serving as board president for two of those eight years. She has been highly active in the League of Women Voters, serving on the board of directors of the League's Bay Area and South San Mateo chapters, and has operated her own publishing company.

In addition to her MBA degree, Gould holds a bachelor's degree in history from Connecticut College and a master's degree in history from Tufts University.

The Public Management Program established in 1971 as an option within the MBA program for students planning careers in government, not-for-profit organizations, and business-government relations.

Peter Coutts Hill condominiums

Stanford University is accepting applications now for rental of the new Peter Coutts Hill Condominiums.

Rental units will be available in December, 1982. Rental agreements, are month-to-month.

Preference in rentals will be given to members of the Stanford community (faculty, staff, students, etc.) and its affiliates. Families with children are welcome.

Floor plans of the various unit types and rental applications are available from the Peter Coutts Hills rental office, 138 Peter Coutts Circle, Stanford, Calif. 94305; (415) 493-1471.

The unfurnished average rents for the various types are as follows:

A-1	(2br/2ba)	$930
A-2	(2br/2ba/study)	$1,010
A-3	(2br/2ba/study)	$930 (handicapped unit)
B	(2br/2ba/study)	$985
C-1	(3br/3ba)	$1,095
C-2	(3br/3ba/study)	$1,200
D	(3br/3½ba/study)	$1,260

These are average monthly rents. The actual rent on any particular unit may vary slightly according to unit location. Additional rent of $50 per month will be charged for each unrelated adult in excess of one per unit.

Jon Cosovich

Cosovich to become Michigan V.P.

Jon C. Cosovich, 47, director of development for major gifts at Stanford University, will be recommended to the University of Michigan Board of Regents as vice-president for development and university relations, effective Jan. 1, 1983.

Michigan President Harold T. Shapiro, who will recommend the appointment, said Cosovich is "regarded as one of the nation's foremost academic development professionals."

Cosovich called Michigan "a magnificent public university with a great future."

One of six vice-presidents at Michigan, Cosovich will be responsible for public relations and fund raising, providing counsel to the president, the regents, and other segments of the university community.

He will succeed Michael Radock, who retired last year. Cosovich's appointment followed a national search by a faculty-staff-alumni committee headed by Dean Ara G. Paul of the U-M College of Pharmacy.

Cosovich received his Bachelor of Arts in political science from Stanford in 1957 and has been a staff member here since 1961. Since 1977, he has been director of development for major gifts, amounting to $25,000 or more, from living individuals, certain private foundations, and closely held corporations.

Cosovich is a member of the management committee for development at Stanford, a university which has ranked second only to Harvard among private institutions in gift support averaged over recent five-year intervals.

Cosovich married his Stanford classmate, the former Katharine Getchell of San Marino, Calif. They have three children: Charlie, a Stanford freshman; Peter, a high school student; and Sarah, a junior high school student.

Ten emeriti back in the classroom

Ten more emeritus professors have been recalled to active duty at Stanford during 1982-83, bringing the total for the current year to at least 27.

As approved by the Board of Trustees Oct. 12, those recalled include Marvin Chodorow, the Barbara Kendall Browning professor of applied physics and professor of electrical engineering; Jon Eisenson, professor of speech and hearing sciences recalled in the sophomore seminar program; Bert A. Gerow, professor of anthropology and anthropology curator.

Also: Arthur Giese, professor of biological sciences,, recalled in the sophomore seminar program; John D. Goheen, professor of philosophy; Frank G. Miller, professor of petroleum engineering.

Also: John L. Mothershead, professor of philosophy; Norman A.D. Parlee, professor of applied earth sciences; Philip H. Rhinelander, the Olive H. Palmer professor of humanities and professor of philosophy; and Arthur I. Samuel, adjunct professor of computer science.

Pick up parking stickers or else get tickets Oct. 19

Many Stanford faculty and staff members have not picked up their new parking stickers, according to Ramona Kelley of Police Services.

The office is open from 8 a.m. to 6 p.m. for pickup of stickers, and Kelley recommends that it be done soon, because citing of automobiles with outdated parking permits will resume Oct. 19.

Those who signed up for payroll deductions for parking stickers will find that no money has been taken out of their paychecks yet. The payroll deductions will begin in November, with a double payment coming out of the Nov. 22 paycheck: $12.50 for A stickers and $3.34 for C.

Carolyn Walker elected

Carolyn Walker, director of Stanford's Learning Assistance Center, has been elected to the board of directors of the Western College Reading Association. She will serve as chief financial officer for 1982-83.

The Association is a national professional organization for college and university learning centers.

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.

Published by the Stanford University News Service, Patricia J. Black, editor; Karen Marman, design assistant; Charles Painter and Ed Souza, photographers; Medicals news editor, Lisa Ames, ext. 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

Paul Goldstein sees new legal idea— 'right of publicity'

BY DONALD STOKES

A firm markets a sweatshirt blazoned with the image of Count Dracula, as played by a movie star who made the character famous.

The heirs of the now-deceased star sue, claiming breach of the star's rights in his likeness.

Nonsense, says the defending lawyer.

Pay up, say the heirs.

This is an example of an issue that is arising with increasing regularity in the law. It concerns a right that is only just beginning to take shape in the minds of lawyers and of those in the entertainment and merchandising industries.

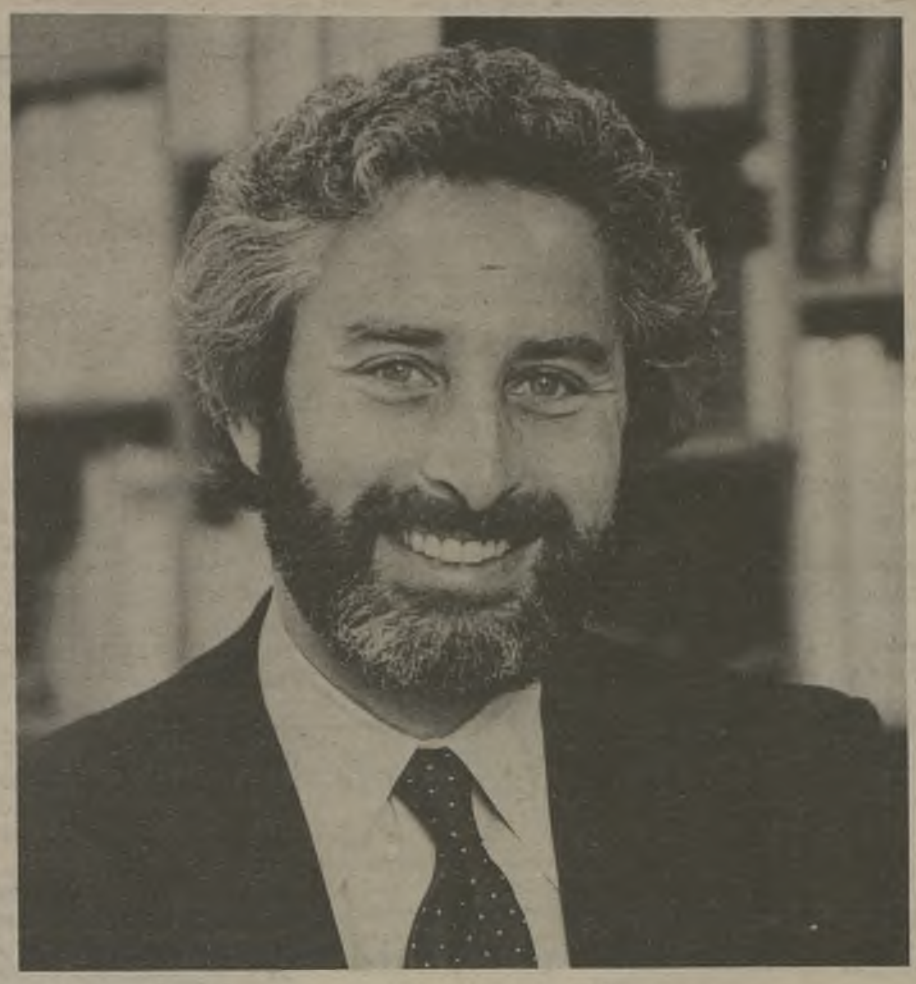
Prof. Paul Goldstein, of Stanford Law School, regarded as a leading academic in the field of intellectual property, is now at work on this newest addition to the field, called "the right of publicity."

Goldstein is 39, has a neatly barbered beard, and blue piercing eyes that make him look like the good guy in a prime-time courtroom drama.

The issue, says Goldstein, boils down to this:

Should people who have made reputations by doing something remarkable, or becoming known by playing certain roles, or by being in the public eye for any reason, have the right to protect themselves against those who wish to capitalize on their publicity value?

He gave various examples:



"Recently there was a Supreme Court case involving the videotaping, without his permission, of a circus performer, 'The Great Zacchini,' being shot out of a cannon. Several cases involved the marketing of Elvis Presley memorabilia, and another was the case of a group that acted in a take-off of some Marx Brothers routines.

"It is hard to find a doctrinal thread running through all these, but in essence they all concern rights in publicity.

"Other possible examples range from the astronauts' right to sell their story of their experiences in space, to convicted Watergate criminals—and indeed, other criminals—who have a special vantage-point in an event of great public interest, and want to capitalize on it.

"We are on the threshold of a new area of intellectual property law. It will be interesting to watch it develop, and I plan to pay considerable attention to it.

"While courts speak loosely of a 'right to publicity,' there is really no such right at all, only a congeries of traditional doctrines—trademark, copyright, privacy—that can variously be used to protect publicity values."

We are on the threshold of a new area of intellectual property law. It will be interesting to watch it develop, and I plan to pay considerable attention to it.

—Paul Goldstein

Goldstein gave various examples of how the law had tried to fit these new values into existing doctrines. A famous football player, Wisconsin's "Crazylegs" Hirsch, sued a company that put out a shaving gel called "Crazylegs." The court held for Hirsch, both on privacy and trade name grounds, even though the two theories are often at cross-purposes.

The intellectual property that might be claimed could relate to whatever about an individual had become famous—it might be his personality, his deeds, or even his property. One dispute concerned a media commercial depicting a car that a celebrated racing driver had made famous; the driver sued and won.

"Bert Lahr once sued for an imitator's use of his distinctive manner of speech in a television commercial.

"Intellectually, the excitement for me is in seeing new values emerging, and watching how the law absorbs these new values and rationalizes them," said Goldstein. "The economic interests at stake are enormous, as are the public policy implications."

Goldstein teaches a basic course on Intellectual Property Law. He has written a book, *Copyright, Patent, Trademark and Related State Doctrines* (Foundation Press, 1981) that is widely considered the leading text in the field. He has also published a service of articles that represents a comprehensive treatment of major themes in copyright law.

He is also very interested in the ways in which the new technologies intersect with copyright. "I focus specifically on the positive aspects in this interplay," he said. "Much of the writing about this in recent years has been on the negative side, for example on how photocopying is infringing on authors' copyrights. I prefer to look at the ways in which technological and institutional innovation can preserve authors' rights.

"We hear it said that free photocopying will destroy the copyright system, and that home videotaping is going to destroy the motion picture industry. I think that these claims are essentially correct, and that new techniques are needed to control these newly dispersed uses of copyrighted materials.

"The real problem with controlling dispersed uses is transaction costs. The present concern on the part of researchers who photocopy articles in their work is that it would take so long to negotiate permission from copyright owners that is simply not feasible. Very few people would object to paying a few cents for the right to include copyrighted material in their own work.

"Congress and the courts have been reluctant to bar photocopying. The thought is that if everybody had to negotiate in the present way for copyright clearance, the world of photocopying and to some extent that of research, would come to a halt. It would be far too time-consuming. It would mean correspondence, phone calls and executing letters of permission, perhaps on a massive scale.

"Now, however, the technology exists for swift and efficient means for negotiating clearance. For example, a fairly simple, computer-based copying system could be devised in which copyright holders tell the system either how much they wish to charge for copying each of their titles, or give their phone number if they want to haggle over the price.

"The researcher would summon up the title at his or her keyboard and, if wishing to make a copy, would do so at the indicated price, or would telephone the copyright negotiator to negotiate the price. The system would then make the copy and administer the billing and payments.

"Institutional innovations, like copyright clearinghouses, are also possible. ASCAP has been operating as a clearinghouse for musical copyrights for more than half a century. Also the Copyright Clearance Center has recently been set up to facilitate licensed copying from technical journals."

Goldstein is interested in proposals being made for a public lending right which would enable authors to secure a royalty every time one of their books is borrowed at a public library.

"It is a fine idea, for it would mean that for the first time in this country authors would be compensated in proportion to the use of their work," said Goldstein.

"All the system would need would be a simple coding method for the transaction to be recorded and for both publisher and author to receive appropriate shares.

"Under the present system, publishers get little information about which books lent by libraries are the most popular. This proposed system would enable publishers to keep in touch much more closely with the interests of the borrowing public. It would be an enormous aid to authors and publishers."

An interviewer asked whether this was not a recipe for encouraging still more the trendy and shallow type of best-sellers.

"That is a separate issue," Goldstein replied. "I understand the concern about the quality of what the American public reads. Yet historically—and properly—the solution in this country is not to tamper with the mechanism for supplying books. It would be far preferable to alter demand, most probably by upgrading the public education system."

Goldstein is also an expert in real property law. He teaches an introductory course on property, and also an advanced course in real estate transactions. He published a book called *Real Estate Transactions, Cases on Materials on Land Transfer, Development and Finance* (Foundation Press, 1980). He is completing a textbook for the introductory course.

Goldstein spends a good deal of time in class

Strike...

continued from page 1

Tentative agreement was reached early Friday, following more than 18 hours negotiation with federal mediator Dorothy Christiansen. The bargaining unit totals 1,350. By Friday, about 37 percent of the bargaining unit was working. The union sought increases totaling more than 24 percent in a two-year contract.

The new contract calls for across-the-board increases of 7 percent, retroactive to Sept. 1, in the first year, with additional across-the-board increases of five percent in both the second and third years.

In addition, it creates a new fourth step, with increases of three percent in the first year and two percent in the second year, and adds a fifth step, with an increase of two and a half percent in the third year.

The principal effect of these provisions will be that longer service employees will receive more money earlier than would have been the case with the University's final offer Sept. 7.

Under the terms of the new agreement, the combination of normal step increases, across-the-board increases, and new fourth and fifth steps in the wage structure would result in bargaining unit employees receiving increases totaling 10 to 12 percent in the first year, 7 to 10 percent in the second year, and 7.5 to 10 percent in the third year.

In addition, the University agreed to pay $5 more per month toward medical insurance for dependents, effective Jan. 1, 1983, and to a cost of living adjustment of up to 25 cents per hour in the third year of the contract, if the consumer price index for urban wage earners and clerical employees rises more than 20 percent.

Raises of 10 percent

At present, 85 percent of the bargaining unit is at step three of the wage range. During the first year of the contract, they will receive increases totaling 10 percent. This includes seven percent retroactive to Sept. 1 for all time actually worked and three percent after they complete their first year on step three.

Those on the first and second steps of the range will receive increases totaling 12 percent in the first year. This includes the seven percent increase across-the-board and a five percent step increase when they become eligible for the next step in their range during the year.

In the second year of the contract, bargaining unit members would receive increases of seven to 10 percent. This includes five percent across-the-board, plus an additional two percent for those in the fourth step or an additional five percent for those progressing to the second, third, or fourth step in the year.

In the third year, the increases would range from seven and a half percent to 10 percent. This total includes five percent across the board, plus two and a half percent for those moving into the fifth step and a regular five percent step increase for those moving into the second, third, or fourth step.

Employee paychecks Oct. 22 will reflect the across the board increase and, where appropriate, the new step increase.

Retroactive pay, covering increases for all work performed since Sept. 1, will be included in paychecks Nov. 7.

Further discussion

Priscilla Wheeler, the University's chief negotiator, said Sunday, Oct. 10, she was prepared to meet with Paul Supton, the union's attorney, to discuss possible disposition of charges filed by both sides earlier with the National Labor Relations Board.

The union contended the strike was based on an unfair labor practice, the University's refusal to disclose detailed information concerning temporary and contract work. On Tuesday, Oct. 5, a USW leaflet agreed to a University proposal to deal with this issue in a sideletter.

"Our proposal is made based on our understanding, expressed by management, that their intent is to have discussion in good faith regarding the union's concerns about work preservation," the leaflet said. "It is clear to us that Stanford will not comply with the NLRB order and it will be many months before the court will require Stanford to turn the information over."

The University had filed two unfair labor practice charges against the union for its failure to notify the Federal Mediation and Conciliation Service of the contract dispute and for the union's failure to provide proper notification to FMCS in advance of striking a health care facility.

At least 24 persons were arrested in a variety of picket line incidents during the strike. Wheeler said resolution of these cases is "in the hands of the district attorney" and outside the scope of the agreement. "The union said it could not condone violence; neither can the University," she said.

She said both sides agreed all workers should return to their jobs. The University has 30 days to decide whether individual workers should be subject to discipline for any acts of vandalism, violence, or other gross misconduct during the strike.

Any resulting grievances would be subject to arbitration under a new, expedited process in the new agreement, she said. "Neither the union nor the University intends any retaliation for participating or not participating in the strike."

Summary of changes in USW agreement

Following is a brief summary of the principal changes, except for wages, made in the new agreement between United Stanford Workers and the University:

Grievances

Permanent umpire will hear job classification grievances and other grievances mutually agreed to. Hearings will be scheduled more quickly. All discharge and permanent layoff grievances have priority. Layoff grievances must be filed within 35 days of receipt of layoff notice.

Vacations

Employees 60 and older who have 10 years or more service may accumulate 60 days of vacation. At retirement, worker may take terminal vacation or a lump-sum payment.

If University alters worker's vacation schedule (which can only be done for operational needs), the worker may request a meeting with the supervisor and have a steward present.

Early vacation payment may be requested only twice in a calendar year.

Discipline

Worker may have steward present during the investigatory interview that precedes decision to discipline worker.

Written warnings and reprimands cannot be used against a worker after 18 months of satisfactory performance (formerly two years).

Personal Time Off

Up to 8 hours of personal time may be taken in one month. Maximum personal time off in any two-month period is also 8 hours. Personal time off is still limited to 24 hours per year.

Retirement

Employee has option of working beyond normal retirement age of 65. Revised to reflect changes in federal law.

Insurance

Replace death benefit gratuity with group life insurance effective 12/1/82. Worker may purchase insurance for one, two, or three times annual salary. Otherwise, employee is provided $5,000 insurance at no cost.

Effective 1/1/83, the University will contribute an additional $5 per month toward dependent coverage on medical insurance.

Layoffs and Reductions

Workers reduced to below 75 percent time (who previously worked 75 percent to 100 percent) may choose to be permanently laid off or remain employed on reduced time. If worker is re-employed in the same reduced-time position after electing to be laid off, all severance must be repaid to University.

University and union will attempt to identify alternate work that could be performed without training by workers on temporary layoff.

For certain categories of workers, seniority governs the order of layoff if skill and ability are *relatively* equal. For other categories of highly skilled jobs, seniority is only considered when skill and ability are *substantially* equal.

Hiring Preferences

For certain categories of workers, those on layoff are given preference for positions over transfer and other candidates if they are *qualified*. For the more highly skilled including most research jobs, those on layoff are given preference if qualified, unless another applicant for the position is better qualified. In both cases, a worker may refuse two job offers before losing layoff preference.

Candidates for promotion or transfer are given preference if qualified, unless another applicant is better qualified.

The University will encourage posting of vacancies within operational units in which vacancies occur.

New Committee

The Committee for Union-University Concerns (CUUC), is established to consider issues of mutual interest and concern, including safety, affirmative action, and training.

How the Three Positions Compare

First Year

Agreement	Union	University
7.0 wage increase	10.25 wage increase	9.5 wage increase
3.0 new step four	no new step	no new step
University pays $5/month more toward medical coverage of dependents 1/1/83	1.0 benefit increase	no benefit increase

Second Year

Agreement	Union	University
5.0 wage increase	5.0 wage increase	5.0 wage increase
2.0 add step four	5.0 new step four	2.5 new step four
no benefit increase*	2.0 benefit increase	no benefit increase*
no range reallocation	3.0 range reallocation	no range reallocation

Third Year

Agreement	Union	University
5.0 wage increase	No third year	5.0 wage increase
2.5 new step five	2.5 add step four	
Cost/living max. 25 cents/hr.	Cost/living max. 15 cents/hr.	

*Under present contract provisions, which would continue, University will offer union any benefit improvement offered non-unit workers in benefit plans which are common to both.

Goldstein/continued from page 3

dealing with the highly topical issue of financing real estate transactions. At a time when prices for residential real estate are high, and finding funds for purchase is difficult, Goldstein runs over various methods of broker-engineered "creative financing."

"What many people think of as new ideas in financing residential property, such as 'wrap-arounds,' have been a part of commercial real estate financing for many years," he said.

"It is interesting to watch the gradual infiltration of commercial finance techniques into residential transactions. For example, it was regarded as a marvelous innovation when equity sharing was suggested. This is the sharing of property between a homeowner and a financial institution, and in its appreciation, if any, when sold, or after a specified period.

"In fact, equity sharing had been around for years in commercial ventures such as shopping center developments.

"I think it would be far more creative to see real estate techniques introduced into more removed areas, such as aiding the formation of human capital through the financing of college and professional educations."

* * * *

Goldstein was reared in Mount Vernon and Scarsdale, suburbs of New York City. He went to Columbia Law School on the advice of his honors adviser at Brandeis. He had planned to do graduate work in history, but his adviser's comment on this idea was, "The best Egyptologist I know spent a year at law school—why don't you?"

He followed this advice, and enjoyed law so much that he decided on it as a career, and that he would teach it. This he did at the State University of New York at Buffalo, where he stayed for five years before coming to Stanford as a visiting professor in 1972-73.

He spent a further two years at Buffalo as full professor and then joined the faculty at Stanford Law School as professor in 1975.

His wife, Jan Thompson, is also an academic. She is an art historian teaching at the University of Santa Clara.—**Donald Stokes**

Electron beam lithography: the cutting edge in electronics

The new machine may be EE's major investment

Scientists wear protective "bunny suits" at the electron beam system at the Center for Integrated Systems.

"Possibly for the first time we have a facility as advanced as any in industry," says Prof. Fabian Pease about Stanford's new $2 million state-of-the-art electron beam lithography system.

It may constitute the largest single purchase by the Electrical Engineering Department ever.

The machine will be the technical cornerstone for research work done at Stanford's new Center for Integrated Systems (C.I.S.) a unique cooperative venture between the University and industry.

The lithography system will help build ever more densely-packed integrated circuits—more circuits on a chip.

"In the old days manufacturers brought separate electronic components together and wired them up," explains Pease. "Each wire was put in individually at the cost of about $1 a wire."

People soon realized that circuits could be made much faster and cheaper by depositing a thin film of metal and other materials and then engraving them to define individual components and wires in one quick step.

Engraving is achieved using a light-sensitive polymer (photo-resist) covering the surface of the film. Where the photo-resist is exposed to intense light it either makes or breaks chemical bonds and desired areas of the polymer can be dissolved away. The film is then dipped in acid which etches the metal parts away in the areas where the photo-resist has been removed.

Unfortunately nature imposes a lower limit on the size of structures which can be patterned with this technique. The limit is roughly the same size as the wavelength of light—about half a micron (there are a thousand microns in a millimeter).

Like a TV beam

An alternative is to use an electron beam instead of light to pattern the resist. With electrons much tinier structures can be defined "for the same reasons that an electron microscope is superior to a light microscope.

"To build up the electron pattern you build it up point by point as does the beam in a TV set."

This is very convenient for controlling with a computer, Pease says, but is very slow.

"A three-inch wafer can take 20-30 minutes to pattern (with an electron beam) while it would take less than a minute with photolithography."

One question which Pease and his students are trying to answer is: "Can you speed up the beam?" There are several ways to do this. One approach taken by researchers at Bell Laboratories and in Japan, is to develop more sensitive polymers which will respond faster to the beam. Unfortunately, as you make the resist more sensitive you lose the ability to define really tiny structures with it, so ultimately you strike a compromise between the two.

The emphasis at Stanford has been on the electron beam itself. Pease's funding comes generally from Defense Advanced Research Projects Agency (DARPA) and the National Science Foundation.

"One alternative is to get more current into the beam, but there is a limit on the electron sources and on the mutual electron repulsion"—the negatively charged electrons repel each other.

Fabian Pease

One project, just begun, uses a matrix of beams (up to 8 by 8). Controlling such a beam is difficult, but micromachining techniques developed by a team led by James Angell should make it possible.

Another technique focuses the beams in a way that permits the researchers to slow them down. The slower electrons are more effective in exposing resist and the exposure process can be speeded up.

Pease says another problem that must be tackled is the function of very tiny circuits. "Transistors made with sub-micron features behave in ways which are only beginning to be understood," he says.

Superconductors

The shortcomings of the sub-micron "wires" may be even more serious.

"A tenth of a micron wires wouldn't work—we may have to cool the chips with liquid nitrogen. . . ." he says. At those temperatures (-196 Celsius or -321 Fahrenheit) electrical resistance essentially disappears.

This difficulty with the wires may lead to a totally new design of chip as the operating speed will be controlled by the time a signal takes to travel along a wire.

"Traditionally, chip architecture was based on minimizing the number of gates (transistors), not minimizing the number of wires," he says. Now the situation is reversed.

Pease speculates that what is needed is an architecture in which one part of a circuit only talks to its neighbor.

"One possibility is to exploit the third dimension and make taller chips."

At present the system sits in a room in the basement of the McCullough building in a strictly controlled environment. The temperature has to be held constant to within a tenth of a degree Celsius or thermal expansions and contractions would blur the patterns made.

The room must also be dust free and the people working in the room have to wear cover-all "bunny suits" to keep them from contaminating the work.

Pease believes the purchase of the system will open research into a far wider choice of approaches to solving the problems of shrinking electronics. The machine will also keep Stanford researchers at the cutting edge of this technology, an investment worth the money, he thinks.—**Simon Bending**

No shortcuts in college education—Fred Hargadon

Most college guidebooks "tend to treat both students and institutions as fixed objects, when the very point of college education is change," says Stanford Admissions Dean Fred Hargadon, national chairman of the College Board.

Having worked both at Swarthmore and Stanford, Hargadon says "colleges don't have a single academic milieu, and don't have a single social milieu; they have several," changing even during students' four years there.

Guidebooks and ratings based on a handful of anonymous personal opinions may reinforce the notion that students should go to college with students just like themselves, rather than institutions where they will find people of more diverse backgrounds.

Guidebooks "reinforce the wrong notion that college is something you go to and passively receive whatever it is they give, instead of actively pursuing the resources they have to offer," he adds.

Hargadon emphasizes that there are no shortcuts when it comes to selecting colleges to apply to or obtaining admission to any of them, despite the money people spend on popular treatments of both.

"There is no substitute for both hard work and planning, which should begin much earlier than the senior year of high school," he declares. Peterson's Guide, Cass and Birnbaum, and the College Board Handbook serve as useful guides for basic information.

"The problem with students in selecting college is that they don't do the homework," he adds. "I think it makes far more sense to read our 135-page bulletin about Stanford rather than a two-page writeup anywhere, whether it's glowing or not. At least you know who wrote it."

About nine percent of this year's freshman class at Stanford is black and about nine percent Chicano, compared to about seven percent for each group last year. Hargadon says: "I think they tend to come here after thoroughly reviewing factual information we provide.

Unlike many Eastern universities, Stanford had record numbers of minority applications, admissions, and enrollments in its freshman class (141 blacks and 137 chicanos in a class of 1,617). Stanford remains one of the few institutions nationally to admit students without regard to financial need.

Letters to the editor

Cohn takes Kennedy to task: the 'home truths' are being lost to gimmickry

Editor, *Campus Report*:

"What Darwin had accomplished, for once and for all, was the demonstration that a single way of knowing was no longer possible." "There is not one single objectively verifiable world: there is, rather, the cat's world, the bird's world" (Donald Kennedy, "Speech to the University of Oregon," published in the Oct. 6 *Campus Report*).

One could conceivably dismiss these remarks as expressions of "Donald Kennedy's world," which has no bearing on anyone else's. But precisely I do not agree with him on this point and since he is supposed to be our intellectual leader I take his remarks seriously and will try to show why he is wrong.

This sort of relativism did not originate with Darwin or our era but goes back to the Sophists, whom Socrates deplored and fought (we may yet have to resort to lacing our Dr. Pepper with hemlock). Nor do our *very* best modern thinkers succumb to this feckless pluralism: Einstein himself declared that "Science without religion is lame."

Mallarme, whom Edmund Wilson and Hugh Kenner and even Sartre have compared to Einstein for pivotal importance, told a young poet who was tinkering *scientifically* with his art, "You can't do without Eden." Camus has spoken similarly of the "hidden sun" and the "sacred" which are indispensable, as he learned from Hitler and Stalin, to avoid mass suicide and murder.

Clearly, then, there is something gravely amiss with the following concluding statement: "That unity (of humanities and science) is the brightest and most exciting academic vision we could possibly have."

A modest example of what is lacking in this vision is provided by the byzantine development which has all but wrecked the study of literature in our time, through precisely a tinkering over-scientization. Again, some of our finest thinkers warned against this trend and went unheeded: Lionel Trilling, Harry Levin, Rene Wellek and our own Richard Lyman.

Mind you, it is not a question of reversing the movement of reasoning in the humanities (even very rigorously), which began, say, with Descartes and his project for a universal grammar.

Mallarme himself has led strongly in this direction. But he didn't stop there, unlike those swarms of sorcerer's apprentices who always take over and run hog wild in time. In these circumstances, one has to "go to the top man" and think things through with an ever-heavier challenge and ultimate responsibility commensurate with the "excitement."

In Nazi Germany, in My Lai, in Beirut, there was no substitute for deep instinct, belief, faith. Computers, even at Stanford, cannot make our moral decisions for us. If the pressures are increased by phenomena we have discovered, such as "range compression," we also have discovered, thank heaven, that there are stalwart souls who can always resist those pressures. That used to be called "spiritual strength" and has nothing to do with the marriage of science and the humanities, desirable though that may be for all sorts of reasons (as well as dangerous, as Dante surely knew). The spiritually weak may always be very numerous, as in the time of Hitler and, alas, our own, but in this matter of moral truth, quantity is far from being the essence. Precisely in such crises we need a clairvoyant few in high or low places.

Obviously, instinct can err, and it is not a question of knowing *the* truth but then neither is it a question of throwing it out, giving up on it! That is a subtle but all-important point: the great thinkers I mentioned all kept striving toward an elusive distant "star" of meaning which they could not see—could "glimpse," at most, as Bellow said in his Nobel speech—but knew was "out there."

That, they were aware, was the *sine qua non* of their humanity, which is not the same thing as a "cat's world" or a "bird's world." And as one of my best students put it to me a few days ago, we really do *know* far more than we can articulate in this respect; he cited a passage from the *Divine Comedy* in which two people in purgatory touch, like ants' antennae, with a secret understanding. Yes, we do rendezvous in space-time, *sub specie aeternitatis*, and *know* without saying anything, at times.

A humane leader of a great university owes it to us to remind us of these home truths occasionally, especially in an era of peril and severe disorientation.

How did we come to this pass? At one time in this country our universities, stemming from religious movements, had a core of belief in the "higher things," the "ideal." Often the prexies were sons of ministers, diverging from strict dogma to a culturally-interesting extent. But at some juncture they went a step too far toward pluralism, "do your own thing," modish emptiness. In this they went along, in limp compliance, with a dispirited period, showing very little of the creative vitality of the Tolstoys, Brahms, and Cezannes.

To get into presidential or other administrative office, as everyone knows, you have to be a politician, inclined to mouth the fashionable shibboleths, and flatter the abandoned and psychically deprived youth with their inchoate myths and opportunism.

Did we err in picking a scientist for our president? Although Lyman at times uttered heartenningly idealistic sentiments, even he had trouble articulating them publicly: chances are we would have gotten another crowd-pleaser even in a humanist.

Let's face it, we are in deep trouble.

The humanities, which were supposed to get a big boost, have not improved, on the contrary. Some more strong figures have left and enrollments drastically dwindled. All we have been given is a showy parasite "Institute" which will do practically nothing for the organic host except suck its substance. Foundation money, expensive press-agentry and gimmickry aren't going to do it. . . And yet it is singularly the humanities which have the best chance of keeping some hold on those "home truths."

This is not to say "Despair, along with the Muggeridge and the other doomsayers." The world has seen worse. We will survive and flourish again, no doubt. The best of the future will be built on the foundation of the best of the past, with due modifications, and not all the stoneless, graceless, apocalyptic tripe of the "emptier than thou" types. Mostly it will be built on a renewed faith, that of our fathers (and mothers) and ourselves.

Robert Greer Cohn
Professor of French

Ombudsperson's report confirmed

Editor, *Campus Report*:

One of my Ph.D. students from Taiwan whom I came to know well several years ago told me of exactly the kind of surveillance of Taiwanese students recently reported by the Ombudsman, carried out by other Taiwanese students and nationals who convey information back to the Taiwanese government.

Surveillance of this kind is particularly felt by students who are native Taiwanese rather than members of the ruling Kuomintang class originally from the mainland. This student also asked me not to raise discussion of this issue in any open forum, because of fears that he could then be indirectly identified through me, putting his family and relatives who remained in Taiwan at risk.

I'm very glad to see this issue brought into the open by someone with the stature of Prof. Goheen, though I feel that I must still protect my student's privacy by asking that my name not be published with this letter.

A Stanford Faculty Member

Dog sniffer finds hashish, cocaine; Alpha Delt arrested for possession

In what may be the first West Coast case involving drugs imported from the People's Republic of China, Stanford student Neil David MacAvoy was arrested Wednesday, Oct. 6, for possession of hashish and cocaine.

Police officers kicked in his door at Alpha Delta Phi fraternity to make the arrest, according to Stanford Police Capt. Raoul Niemeyer.

No other students have been implicated, although police will continue investigating the case, Niemeyer said. MacAvoy, 20, is a junior from Corning, New York.

According to Niemeyer, a package addressed to MacAvoy from China was found by customs officials to contain drugs. Their suspicions were aroused by a dog specially trained to recognize the smell of drugs.

Postal inspectors subsequently assisted Stanford police in seeking a search warrant. It was signed by Judge Edward Scoyen Tuesday afternoon, paving the way for Wednesday's bust.

Joining Stanford police shortly after noon at the Alpha Delt house, 375 Campus Drive, were agents of the Santa Clara County Narcotics Bureau, the Federal Drug Enforcement Agency, and the U.S. Postal Service. A dozen officials took part in the arrest, which climaxed a two-week investigation.

A postal service employee delivered the package, then the dozen-member arrest team moved in, according to Niemeyer. Police announced their presence, ordered MacAvoy to come out of his room, then kicked in the door when after 20 seconds he failed to open it.

Niemeyer said the dog who sniffed the drugs, a German shepherd named Lightfoot, has "600 to 700 successful sniffs" to his credit.

Alpha Delt fraternity has a reputation among students for drug involvement, Dean of Student Affairs James Lyons said Wednesday.

"Many students in the house have tried to rid the house of this reputation. This incident obviously won't help their cause one bit."

Lyons also said the University "cannot and should not provide students with a refuge from the law. If one deals on campus with cocaine, hashish, or other drugs, one does so with considerable peril.

"Inevitably lots of students know about it and consequently there is a heightened chance of law enforcement agencies knowing about it as well. And when caught, a student will need lots of money and a very good lawyer for a defense."

Asked if MacAvoy would be subject to the University's internal disciplinary provisions, Lyons said the University has "tended to see drugs as a medical problem, not a disciplinary problem.

"Major sale and distribution of drugs is bound to be a matter of concern to the University but ordinarily public law takes care of this quite well," he added.

Lyons said he was not surprised by Wednesday's drug raid. "The availability of drugs in the Bay Area is known to be widespread and law enforcement agencies themselves have said it's beyond their capacity to provide adequate enforcement.

"There is nothing new about student being presented with the choice of using drugs when they go to this or any other college. These days, most of them confronted that choice when they were in junior high or high school," Lyons said.

Lipset wins two posts

Prof. Seymour Martin Lipset of Stanford, a senior fellow at the Hoover Institution, has been chosen president-elect of the World Association for Public Opinion Research and vice-president of the International Political Science Association.

President of the American Political Science Association, he will serve two years as president elect of WAPOR (1982-84) and two as president (1984-86). His vice-presidency of the IPSA runs for three years, 1982-85.

Two arrested in ticket scam

Stanford police arrested two Oakland men, George Hightower and Derrick Barbosa, Saturday, Oct. 9, on charges of sale, possession, and forgery of tickets for the Grateful Dead concert in Frost Amphitheater.

About 50 of the forged tickets were recovered, mainly from individuals who purchased them and tried unsuccessfully to gain admission.

Stanford Police Chief Marvin Herrington said the forgeries were "excellent. . .very professional." They were made with blank ticket stock stolen from Ticketron. A total of 16,000 blanks were taken in separate thefts in San Diego and the East earlier this year, he said.

A blue van, believed to contain the ticket supply and several more suspects, got away.

"I don't imagine they'll be back here. They know we're looking for them," Herrington said Sunday, Oct. 10, before a second Grateful Dead concert in Frost.

Once the forgery was discovered, tickets were checked very carefully. "It looks pretty well organized," Herrington said. "They would have to have access to fancy printing gear."

The suspects were booked at North County jail. Hightower, 32, was released late Saturday on $3,000 bail, while Barbosa, 30, was released on his own recognizance.

'Serious shortage' of music teachers imminent, says Kuhn

Teacher education programs in music may prove necessary within a few years, says Prof. Wolfgang Kuhn of the Stanford Department of Music, who helped Stanford get started in this field nearly a quarter century ago.

Kuhn retired Aug. 31, but has been recalled to active duty to teach two basic music courses during fall quarter.

Kuhn was recruited by the Music Department in 1958 to start and direct a teacher education program in music, administered through the School of Education. That he did and very successfully. "Most of the people who graduated from Stanford with D.M.A.'s in music education are now chairing music departments," he notes.

"The number of music education students peaked in the mid '60's. For the last 10-12 years I haven't been doing much teacher education because there hasn't been much demand for it. I've been teaching general courses and developing computer-assisted instruction programs for music students. In a way, though, I feel I'm teaching more people something about music through these general music courses than I ever did teaching methods courses.

"For example, I taught at three of the Stanford Overseas campuses—Tours, Beutelsbach, and Vienna—where I developed courses which were coordinated with local concerts, performances, and opera.

"Of course I'm sad about the demise of teacher education. It's really a sad commentary on our times.

"Projections show that in six to eight years there will be a serious shortage of teachers, so it's probably essential for Stanford to gear up a workable teacher education program, but it will be entirely different from what we had in the '60's and '70's, I'm sure of that."

Many hats

Kuhn came to Stanford with an impressive record in teacher education and music. He began the study of violin in his native Germany, graduating in violin and music education from the University of Illinois in 1937. He then spent 12 years teaching music in public elementary and secondary schools in Illinois.

"In the Depression you didn't think of becoming a professional violinist. . .it just wasn't done. You had to make a living.

"I taught all the instruments, conducted bands, orchestras, choirs, directed operettas—you name it, I did it! It was great training for a music educator. . .it gave me the practical experience that came in so handy when I went on to teach music education on the college level."

In 1953 Kuhn received his Ed.D. in music education from the University of Illinois and became chairman of the Division of Music Education there.

Kuhn wore many hats at Illinois. He was in charge of recording all concerts, including those by the many illustrious conductors and musicians who performed at Illinois, among them Leopold Stokowski, Myra Hess, Paul Hindemith, Benjamin Britten, Georges Ansermet and Igor Stravinsky.

"I've always been interested in technology," says Kuhn. "The music department at Illinois bought a rudimentary home-recording device in 1943 and the chairman asked if anyone knew how to operate it. Since I'd been using tape recording devices as a school teacher for diagnostic purposes, I volunteered.

Kuhn: 'Plans for the future should be in the hands of the younger faculty.'

"Eventually I had my own technical staff. I helped develop stereophonic tape recording in the early '50's with Russ Tinkham of Ampex. We were actually the first people to make a stereo tape recording, released by Ampex—Monteverdi's *Vespers*, conducted by Stokowski. I worked closely with Stokowski editing the master tapes and preparing for a pressing.

"I also reviewed concerts for local papers in Illinois. As a school teacher I'd had to do my own publicity for concerts—music education is partly PR, you know—so I'd picked up the knack of writing reviews.

"When I left Illinois I was doing three jobs—producing records, radio and television programs, taking charge of the teacher education program, and teaching violin. When you're a young and eager faculty member, you tend to take on too much."

From 1955 to 1958 Kuhn chaired the Department of Music Education at the University of Colorado in Boulder. In 1958, chairman Crosten asked him to come to Stanford. At the time, Crosten noted that he had been searching for someone who was both a performer and a scholar and felt that he now had that combination in Kuhn's appointment.

Besides starting the teacher education program in music at Stanford, Kuhn started and conducted the Stanford Summer Youth Orchestra, which eventually attracted talented youth from all over the country. He also conducted the San Jose Youth Symphony in the early '60's.

In 1970, Kuhn brought the Hungarian composer Zoltan Kodaly to Stanford, together with Hungarian composer and educator Erzsebet Szonyi. Together, they conducted the first workshop in the U.S. of Kodaly's Hungarian Music Education Program. Attended by 350 music educators from the U.S. and Canada, this workshop sparked the development of Kodaly's program in the U.S.

"I have always been interested in music for young people," says Kuhn. In 1964 he was instrumental in bringing Dr. Suzuki and his Japanese child- pupils to the Peninsula on their first American tour. Since then, he has hosted a one-week Suzuki workshop on campus every summer. Masses of tiny kids with tiny violins swarm around the Knoll, Kuhn's tall figure moving serenely among them.

Kuhn has served on the editorial board of the *Journal of Research in Music Education*, and has published extensively. He has written textbooks on instrumental and string pedagogy and is also known as an arranger of string ensemble music.

Kuhn has also been acting chairman of the Music Department at Stanford a number of times: in 1966-67, 1972-73, several summers, and again in 1979-80 when chairman Cohen went on sabbatical.

"I enjoyed my times as acting chairman," he says. "I felt I had a grasp of the department as a whole, its direction, where it should go. But I don't think I ever had the temperament to be a full-time chairman. You have to be able to withstand stress, and that's hard for me to do.

"The department hasn't changed much since I came. It's like a shopping center, where you have specialty shops under one roof. Everyone here does his own thing, and is a leader in his field with a national reputation. Sometimes this makes it difficult for the department to act cohesively."

Retirement

Kuhn is retiring just before the department moves into Braun Music Center. "I think plans for the future should be in the hands of the younger faculty. . .it has to be that way. The department needs to decide what it wants to do about teacher education, and they should decide that without me."

Retirement will allow Kuhn to spend even more time developing computer-assisted instruction programs in basic musicianship. His workshop is set up at his campus home.

"I have felt very fortunate in the years I've been at Stanford because I have been allowed to continue my research, do my publishing, and everyone, including the dean's office, has been very supportive of my work. Stanford will always be my home."

The Music Department has also been fortunate. Its chairman, Prof. Albert Cohen, says: "Kuhn has served the University superbly in varied assignments over many years—as director of our music education program, innovative researcher, gifted teacher, and perceptive administrator. We have valued his contributions highly, as well as the collegiality, wisdom, and sensitivity he has brought to his work in the department."—**Julia Sommer**

From left, Laurie Binder, Duncan McDonald, and President Donald Kennedy

McDonald, Binder win Great Race

Dr. Duncan MacDonald of Menlo Park was the first place finisher at the 5th Annual Great Race at Stanford on October 3. His time was 29:04.

The women's division winner was Laurie Binder with a time of 34:08. Nancy Ditz of the Stanford Alumni Association came in second with 34:28.

The race, which attracted more than 2,500 runners, is an annual fund-raising event sponsored by Western Federal Savings to benefit the Cardinal Club, which provides athletic scholarships for Stanford women.

More than 60 volunteers from various athletic departments on the campus helped the Stevens Creek Striders handle the finish line under the supervision of John Law of Portola Valley.

Race communications were handled by a volunteer group of eight men from the Southern Peninsula Communications System. SPECS NET, established 20 years ago, normally responds to local disasters. The group ranges from Menlo Park through Cupertino and has close to 100 members.

President Kennedy's Academic Council talk

Upward shift in faculty age, tenure ratio 'alarming'

Following is the fall quarter report given by President Donald Kennedy to the Academic Council Friday, Oct. 8:

Let me begin by joining my own welcome to that of the Provost. We are, as you can see, attempting something of an experiment here. I want to scotch an unkind rumor by stating that this is *not* a response to the sense of loneliness I feel while reciting my quarterly report to the sparse but loyal two-dozen colleagues that show up for regular Academic Council meetings. On the contrary, I regard the low turn-out as clear indication that the Senate is working the will of the professoriate, and that my colleagues are absent only because they feel their oversight is not needed. At least, not right now!

Instead, the Provost and I *wanted* to launch the year with a convocation that focuses on the Stanford faculty — because what we are as an institution is very much what *you* are.

So in my own report this quarter I will briefly discuss the state of the faculty, and try to indicate what we shall have to do to maintain and even to improve its quality. No task can possibly carry a higher priority for the administration of a university, and Al and I firmly expect our own time in office to be judged in terms of the quality of the Stanford faculty in the Centennial year, or if we are real survivors — at the turn of the century.

Our predecessors deserve high marks on that standard. Over the past ten years, there has been imposing improvement. Just to take a few indicators, in the ten years between 1971-82 Stanford's membership in the major academies has more than doubled: our representation in the American Academy of Arts and Sciences has grown from 52 to 114, in the National Academy of Sciences from 38 to 75, in the National Academy of Engineering from 9 to 37 and in the National Academy of Education from 4 to 9. We now have three Pulitzer Prize winners compared with two, ten Nobel Laureates compared with six, and 11 National Medal of Science winners compared to three.

It is my impression that the care and the standards Stanford employs in searching out and in retaining and promoting faculty are superb. It is important to realize that we do not do those things in the same way they are done by many of the institutions with whom we are often compared. At some institutions of great distinction, most tenured faculty at any given moment have been appointed from the outside at tenure level.

That is not the way it is done here. In the past year only fifteen percent of our appointments were at tenure rank, and 85% were at the level of assistant or non-tenured associate professor. The corresponding figures five years ago were 25% and 75%, and ten years ago 13% and 87%.

Searches for non-tenured faculty are conducted with great care, and we expect to retain and promote between a third and a half of them. That is still our experience; if one compares the percent of assistant professors promoted who were appointed in 1973-74 with the percent promoted who had their first appointments in 1963- 64, ten years earlier, the proportion for the University as a whole has not changed very much. The most recent figure stood at 46% retention; a modest ten-year drop (from 48% to 37%) in the non-medical areas was balanced by an increase in the promotion rate for medical school faculty.

What are the advantages of this strategy? In my judgment there are three.

First, the average quality of the faculty at any given moment is higher, because of the care we have invested in selection of a junior professoriate for which we have high hopes.

Second, non-tenured faculty members sense that they have a solid chance of staying, and as a consequence feel more obligation to the institution and are more interested in building durable programs of teaching and research.

Third, more of our senior faculty will have had their productive research years at Stanford, with all the advantages that continuity and stable affiliation can confer.

Other trends, however, are going to make this practice more and more difficult to sustain. Over the past decade the slackening of federal support for research and scholarship, the rapid inflation of costs, and the failure of private gift sources to keep up with either, have forced an equilibration of faculty size.

After two decades of rapid growth, the tenure line faculty at Stanford during the past ten years has increased at the rate of only about one percent per year. That effect has been augmented by the legislated increase in mandatory retirement age from 65 to 70.

The result has been a significant and alarming shift in the tenure ratio and in the average age of the Stanford faculty. In 1971 we were 42.7 years old, and 65% of us were tenured. Five years later the average age was 43.5, and the tenure proportion up to 68%. Now the average age stands at 45.8, and the proportion tenured to 72%. An extrapolation of those trends suggests how very difficult it will be to keep our promotion rate for non-tenured faculty above one- third.

And the situation will become very much worse, of course, if present legislation to uncap mandatory retirement altogether should succeed. If that legislation were to pass next year without any exemption for university faculties, I think every major research university in this country will have to undertake an agonizing review of its tenure policies.

The almost certain result will be the substitution of something else —likely a term contract — for appointments without limit of time. A "grace period" of seven or eight years, which seems a likely compromise, would allow us some opportunity for finding new ways of living with the situation while we continue to require retirement at age 70. But at best we will be significantly worse off. And even with no new legislation whatsoever, the effects of the age 70 rule and of economic stagnation will cause the average age of our facutly to continue to rise —though perhaps not at the rate of one year for every three¡

The demographics of our faculty also relate to the efforts we make, through affirmative action, to alter its composition while continuing to improve its quality. We are continuing to make some gains in this area, but the closing- off of opportunities at junior levels is a significant impediment to progress.

I think we are making good use of what opportunitie we do have. This last year, for example, one-third of the 68 new appointments to the Academic Council were women; and in the School of Humanities and Sciences nearly half the new appointments, and over half of the promotions to tenure went to women. Overall, it was the most successful year in Stanford's history in increasing the number of tenured women and in appointing new women to the faculty. There is still much work to do, however; only 117 of Stanford's 1,270 Academic Council members are women, and only 48 of the 836 tenured faculty.

Our success with ethnic minority groups was less encouraging; but still, 15% of new total Academic Council appointments went to members of minority groups. Again the School of Humanities and Sciences had an especially strong record, with four new minority group faculty members appointed. The Report of the faculty Committee on Affirmative Action, which we will be implementing this year, should allow us to give renewed emphasis to the important business of making such considerations central in every new departmental search.

The difficult situation we are likely to face in the future will put an even higher premium on our capacity to select and attract the very best young people to membership in this faculty. We will need to make extremely good judgments, and follow these up by persuading the highly desirable people we select that membership in the Stanford faculty is an attractive and. financially feasible prospect. There is little doubt we can manage the first of these, but I suspect we all have continuing worries about the second.

Faculty salaries here have improved somewhat relative to our competition over the past five years; and although we need to be concerned about the gradual erosion in compensation for the professoriate relative to other professions, I do not think we are at a disadvantage except perhaps for one or two special situations.

The matter of housing, however, will require continuing attention. Since I began my term as Provost, we have installed a co- investment mortgage program that now has $12 million out in faculty loans, and should soon have its ceiling adjusted to $20 million. We've built an attractive townhouse and condominium development that is now being occupied, and written down mortgage interests rates there. We have adopted a program of extra compensation to allow for the difference between Peninsula and national housing prices for new faculty, and started work on a large new development on Willow Road that will include rental and sale units available to faculty and staff. Despite all of these ventures, housing continues to be a discouragement for some, and we need to continue to look for imaginative solutions.

I mentioned all of these potential sources of worry not to discourage you about the future, but to indicate our awareness that it poses formidable challenges to the wise management of this institution.

But the challenge is for all of us, because in the end it is the faculty that decides who is to be on the faculty. It is the faculty that recruits, retains, and promotes its new members; and the faculty that sets the intellectual and social conditions for colleagueship that will determine how attractive an environment this is. It is up to us administrators to make sure nothing gets in the way¡ Stanford has extraordinary advantages—vastly improved resources and environments for scholarly work, a superb student body, a splendid location, and an increasingly powerful tradition of accomplishment.

I have been here now 22 years, and I started as an assistant professor. Watching the quality of this faculty grow and then pull along behind it all the wonderful things that have happened here, has been a truly extraordinary experience. I am deeply impressed with the quality of the young people we are now attracting to Stanford. We have come a long way together, my friends—far enough to know there is still more to do and that we can do it.

Text of 1981-82 report from Committee on Graduate studies

Guidelines for Dismissal of Graduate Students for Academic Reasons

CGS recommended the adoption of a set of guidelines for dismissing graduate students who are failing to make satisfactory academic progress. The guidelines call for a precise system of consultations, warnings, reviews, and departmental discussions and decisions, as well as the careful maintenance of records of such discussions and decisions. They also specify the rights of students to examine their departmental files and to appeal under the Student Academic Grievance Procedures.

(The guidelines were approved by the Academic Senate on May 13, 1982, and the Dean of Graduate Studies distributed copies to all schools and departments.)

Photocopied Journal Articles as Dissertation Texts

Certain departments permit the incorporation of photocopied journal articles (sometimes of joint authorship) into dissertations, and even the submission of several such photocopied articles as the full text of the dissertation. Prof. Dale Kaiser, biochemistry, and Prof. Robert Schimke, biological sciences, defended this practice before CGS on the grounds that it was appropriate in scientific fields.

CGS recommended that the contribution of the individual submitting the dissertation be clearly and fully indicated in a foreward or preface. The committee also advised the Graduate Program Office that it saw no intrinsic objection to the use of reprints in the final dissertation copy.

Dissertations in English

CGS reaffirmed the policy of the Graduate Division requiring that dissertations be written in English unless an exception has been approved by the Dean of Graduate Studies prior to the commencement of work. The Committee asked the Dean to make more explicit the conditions under which exceptions will, or will not, be granted.

Validation for Residence Credit

CGS clarified the policy for awarding residence credit for course work done elsewhere. Currently, residence credit was being granted only for courses validated by departmental faculty as comparable to courses the student would take at Stanford, whereas the original intent was that residence credit would also be allowed for courses that, though not exactly comparable to Stanford courses, nonetheless contribute directly to the program of study here.

Standards of Progress and Continuous Registration

CGS approved the following addition to the Standards of Progress and Continuous Registration: ". . . All students must be registered in the quarter in which the degree is conferred. The sole exception to that rule shall be that a student may, without being registered, submit the official thesis or dissertation or apply to receive a Master's degree in the quarter immediately following a quarter in which the student was enrolled."

Program Reviews

CGS reviewed and recommended the continuation of the following graduate programs:

1. *The Biophysics Program.* A subcommittee chaired by Prof. William Little, physics, reviewed the Biophysics Program. The subcommittee concluded that the program was of excellent quality and recommended renewal. CGS accepted the subcommittee's report.

2. *Honors Cooperative Program.* A subcommittee chaired by Prof. J. Michael Harrison, Graduate School of Business, reviewed the University's Honors Cooperative Program, which provides off-campus graduate instruction by closed-circuit television. In particular, the subcommittee considered the possible liabilities of non-California residents taking part in the program, as well as the appropriateness of granting credit to students who have not been admitted to degree programs (an arrangement known as Non-Registered Option, or NRO). It found no serious cause for concern in either respect and recommended the program's continuation. CGS accepted the subcommittee's report.

3. *Cancer Biology Program.* A subcommittee chaired by Prof. Allan M. Campbell, biological sciences, reviewed the Program in Cancer Biology. The subcommittee reported

Jim Angell wanted both engineering and carillon in his life

Bells need constant maintenance

"Professors are all hams, aren't they?" says the professor of electrical engineering who, for over 20 years, has received more than the average share of attention.

His name is Jim Angell, and he is, as he likes to point out, the "angel" behind the Hoover Tower bells.

Angell is the university carillonneur.

Appointed in 1960 by then-President Wallace Sterling, Angell enjoys the attention he receives.

"The thing I enjoy mainly is that the carillon is sort of a special opportunity to share my interests with people, and certainly the great majority of people seem to enjoy it very much."

Scheduling his carillonning around his teaching, Angell performs a large repetoire of compositions. He plays for such official functions as Commencement; he plays for official but informal events like the Big Game against Cal, as well.

He also performs over the lunch hour or after work at 5 p.m., when strollers are likely to hear renditions of Angell's favorite compositions from modern musicals such as "Fiddler on the Roof" or "The Sound of Music."

That Angell does his own transposing is a testament to his extensive musical background. His first musical lessons were on the piano at age four. The organ came next, becoming Angell's "true love" and providing a means of support during graduate school as a church accompanist. By the time he learned to play the carillon, Angell was considering a career in music.

Holder of undergraduate, master's, and doctorate degrees from MIT, Angell is currently associate chairman and chairman of the Graduate Admissions Committee of the department. His area of specialty is in the field of solid state circuitry. He teaches both lecture and lab classes and supervises graduate research.

An added attraction

Angell says that the carillon was a critical factor in his decision to accept a teaching position at Stanford.

"Music has always been a big part of my life and for a long time I wasn't quite sure whether I wanted to pursue music or something technical," he explains. "But I decided somewhere in my mid-high school years that I would probably survive better if I followed a career of engineering with music as a semiprofession rather than the other way around."

Stanford's carillon was donated to the University in 1941 by Belgium in honor of Herbert Hoover's war relief work. A 35-bell, three-octave carillon, it is one of 150 in North America, of which approximately half are situated in university bell towers. The majestic sound of the bells easily conjures up an image of frenetic bell-pulling; however, the instrument is played somewhat like an organ.

Angell explains: "The keyboard consists of a set of broomstick-diameter wooden pegs, which we call batons, which are pressed or struck with the side of the fist. The overall keyboard is about 4½ feet long. The foot pedals really just double for the lower half of the batons, so in effect you have four fists instead of two."

Each baton or foot pedal connects to a mechanism which rings the corresponding bell. Rather than playing a single tone, however, the bell is tuned such that it plays an entire chord. The sound is full and harmonious, but knowing which bell-chords can be played with which can get tricky.

"You have to be a little careful about the way you choose to play bells together," says Angell. "If you're not careful, you'll have quite a clash of the tones of one bell and those of another."

A rare opportunity

Angell's considerable musical talents aren't limited to transposing and playing; over the years he has had numerous students as well. Among the small "club" of carillonneurs, Angell's patient and encouraging instruction is well represented by former students.

Stanford junior Chris Halsted, a prospective carillonneur, is an example of Angell's influence. He became interested in the carillon through his mother, Margo Halsted. A former student of Angell's, she is currently the carillonneur at UC-Riverside, and was influential in the recent expansion and endowment of the UC-Berkeley carillon. That carillon is played by another Angell associate, Ron Barnes.

Berkeley is one of the fortunate few to have an endowed position for the carillon; Angell says that all too few of the existing carillons are played regularly, "simply because there's no money to pay anyone to play them." Not only is there a shortage of funds to pay for a carillonneur, but often the carillons themselves are inadequately maintained because of the expense involved.

James Angell

A carillon is a large capital investment—bells cost about $10 per pound. The smallest bells, weighing 20 pounds, at a cost of $200, are inexpensive when compared to the large bells at the lower end of the range. Weighing up to several tons, these bells ring up a whopping $14,000 bill apiece!

The original investment is far from the last one; constant maintenance is needed to keep the bells in tune. As the bells age, pollution and natural erosion make the bells thinner, thus distorting the tune. According to Angell, Stanford's carillon is badly in need of tuning.

As part of his interest in carillonning, Angell is working toward raising money to improve the Stanford carillon mechanics, and endow "perhaps a third of a faculty position" for a carillonneur (the position is currently without compensation).

To help initiate a fundraising campaign, the Stanford Alumni Club of Washington, D.C. is holding a reception at the Belgian Embassy in Washington on Oct. 8.

Angell sees this as a preliminary effort which he hopes will culminate in enough money to restore, augment, and endow the Stanford carillon. Says Angell, "I want to make darn sure that it's played after I retire."

—Amy Bernhard

Graduate dismissal...

continued from page 8

favorably on the program, although it noted that some students in cancer biology had not received sufficient attention in formulating dissertation proposals. CGS accepted the recommendation for renewal, with the stipulation that students' dissertation proposals be approved by the Cancer Biology Committee as a whole.

4. *Neurosciences Program.* A subcommittee chaired by Prof. Robert F. Kallman, radiology, reviewed the Neurosciences Program. The subcommittee found the program "admirable" and urged its renewal. CGS accepted the subcommittee's report.

New Graduate Programs

CGS recommended the creation of the following new graduate programs:

1. *Medical Information Sciences.* An *ad hoc* committee headed by Prof. Edward Shortliffe, medicine, presented a proposal for an M.S./Ph.D. program in medical information sciences. The program aims to prepare students in the application of computer technology to various aspects of medical science and medical care.

After considerable discussion, (over the course of three separate meetings) and a substantial strengthening of the proposed program's course requirements, CGS voted to recommend its establishment, subject to outside review during the fourth year.

2. *Terminal A.M. in International Policy Studies.* An *ad hoc* committee headed by Prof. Robert Ward, political sciences, submitted a proposal for a coterminal A.M. in International Policy Studies. The new program is in some respects an extension of the undergraduate International Relations Program, but with greater career orientation. CGS voted to approve the program, subject to outside review in four years.

Graduate Specials

Prof. John T. Gill, chair of the Subcommittee on Graduate Special Declarations of Intention, recommended that three students be allowed to work for Ph.D.'s under the Graduate Special rubric:

1. Peter Meffert, in comparative economic systems;
2. Marian Elaine Smith, in acoustics;
3. Palle C. Henckel, in psychoacoustics.

CGS accepted all three recommendations. Two applications were not recommended.

Miscellaneous Actions

1. CGS admitted Shahar Ben-Menahem to candidacy to work for a Ph.D. in physics, even though he had officially studied with only one Stanford professor, Sidney Drell, deputy director of SLAC.

2. The committee recommended revoking the Master's degree of a student who received the degree in June 1980 as part of a coterminal program. The student's bachelor's degree was being suspended for irregularities, making the student ineligible to receive the Master's.

3. CGS recommended revoking the degree of a student who received an A.M. in communications April 1, 1982. The name had been left on the departmental Winter Recommending list by clerical error.

Admissions to Candidacy, Conferrals

During the past year (Summer 1981 through Spring 1982) CGS admitted a total of 2,196 students to candidacy for advanced degrees (in contrast to 1,887 in 1980-81 and 1,820 in 1979-80).

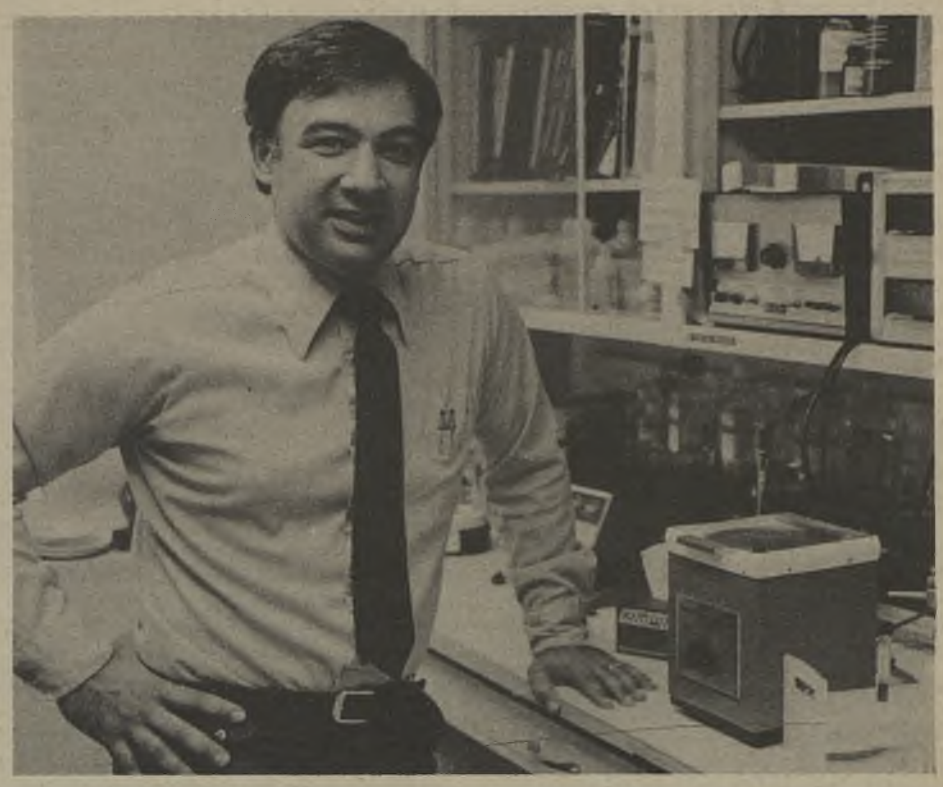
CGS recommended that advanced degrees be conferred on a total of 2,493 students. Of these, 460 were Ph.D.'s.

Paul Robinson
Chair

Shumway to receive Gold Heart Award

Heart surgeon Norman E. Shumway, professor and chairman of Stanford's department of cardiovascular surgery, has been chosen to receive the American Heart Association's 1982 Gold Heart Award.

The award is the highest honor conferred by the AHA for contributions to its national program and to cardiovascular medicine.



Norman Shumway

Shumway's "pioneering efforts in behalf of terminally ill heart patients have gained him international recognition as the leader in heart transplant surgery. His work in measuring and treating rejection of the transplanted heart has prolonged many lives and broadened the field of multiple organ transplants. His gift for training has influenced many others now making their own impact on cardiovascular medicine," noted the AHA.

In January, 1968, Shumway performed the first human heart transplant in the United States. Since then, he and his associates have performed more than 240 heart transplants. Ninety-seven patients have survived.

In March, 1981, Shumway's team performed the first heart-lung transplant. In all, his team has performed seven heart-lung transplants, with four survivors.

Shumway will receive the award Nov. 13 during the AHA's annual meeting in Dallas.

Roland Ciaranello: ***"Students come to Stanford for the caliber of the faculty, and they should be exposed to it. If not, we're no different from any other institution. . ."***

Hospital occupancy low, unit closed

A lower patient census than expected has forced Stanford University Hospital officials to close a nursing unit in the Hoover Pavilion last week.

The drop in patient census at the 663-bed hospital began in June. Normally during the summer months Hospital occupancy remains at about 75 percent or more. This year it dropped to about 66 percent in July and 69 percent in August.

"We are not the only hospital facing a low census, probably due in part to the overall economic recession," said Duane Walker, R.N., M.S., director of Nursing Services. "This is happening throughout California, the western states, and most of the country."

Sheldon King, executive director of SUH, said that the situation is parallel in many private doctors' offices. "With high unemployment nationwide, I would guess that many people have used up their medical insurance and are simply not seeking medical care unless absolutely necessary."

Another cause of the unusually low census, King said, is the Department of Health and Human Services' guidelines which approve the admission of Medi-Cal patients only in cases of emergency or function-threatening conditions.

Nursing Administration, Walker said, is working closely with the union, CRONA, to keep all of Stanford's permanent nursing staff employed. The clinical nursing coordinator and staff of the closed unit (N2A) have moved to other nursing units at Hoover and the main center. Surgical patients usually admitted to N2A will be accommodated elsewhere.

In closing N2A, a surgical unit specializing in sports medicine, Hospital administrators hope to allow other nursing units to provide cost efficient patient care by maintaining a fuller census.

King said that Hospital and Nursing Administration would examine whether another nursing unit should be closed in the near future. "Our reaction to the low census," he said, "must be to reduce resources to match patient needs." He explained that the first step taken on N2A was to reduce its operations to a five-day week.

Walker said that most of the nurses have responded well to the uncertainty that's prevailed throughout the underpopulated units. "One unfortunate aspect is that we're simply unable now to use most of our relief nurses, who have in the past provided a pool of people available to fill in and work certain hours as needed. Until recently we've always been able to utilize them."

Both King and Walker declined to predict when the situation might reverse itself, returning the patient census to expected levels. They think improvement in the economy, when that happens, will probably be the best indicator. Said King, "The number of Hospital reservations has increased again slightly, but not to any significant degree."

—Lisa Ames

DNA bill vetoed

A bill that would have extended the applicable National Institutes of Health guidelines on recombinant DNA research to private high tech companies in California was vetoed by Governor Edmund G. Brown Jr. last week.

The bill had been opposed by recombinant DNA research and development firms as redundant and unnecessary.

NIH guidelines now apply to academic and research institutions doing sponsored research in molecular cloning. The guidelines were scaled down in recent years as further research has shown that initial fears about genetic engineering research were unfounded.

Chairman of Faculty Senate sees necessary changes ahead

Admission procedures, curriculum, and student scholarship are the Medical School Faculty Senate's priorities for the coming year, said the new chairman, Dr. Roland Ciaranello, associate professor of psychiatry.

Ciaranello succeeds Dr. Avram Goldstein, professor of pharmacology, as head of the Senate and of the Committee of Five, the Senate's executive committee. Goldstein held the chair for three consecutive years.

"I have a clear mandate from the faculty to continue in the direction they want to go—educating leaders in academia," Ciaranello said.

In order to do so, however, changes are and must continue to be made, he noted. Admission procedures, for example, must be streamlined to speed them up and cut cost.

"We're losing good candidates to other schools because we're not quick enough in processing and accepting the best applicants," Ciaranello explained. "This is especially true with minority applicants. Students get frustrated with our slowness and settle for another school."

Steps have already been taken to streamline the procedure. This year, for the first time, a computer will screen all applicants—almost 6,000—and narrow the pool to 2,000. These 2,000 will be processed by the admissions committee in the usual manner.

Critics of the computerized system are reacting "psychologically," Ciaranello said. "The personal process is still there, it just starts later on. By screening out the less qualified applicants by computer, we have more time to spend reviewing the cream of the crop."

Ciaranello stressed the need for active recruitment, and said Dean Dominick Purpura is considering hiring a minority admissions recruiter.

"We have to be aggressive in our recruiting. If we aren't, we'll be left with a passive admissions process that will not get the best to come to Stanford."

The Medical School should also recruit Stanford undergraduates more actively, Ciaranello said. "We don't recognize the quality of our own students."

Once the students come to the Medical School, they should face a more streamlined curriculum, Ciaranello continued. The Senate favors the return to a basic medical science core curriculum. Elective courses interfere with the time students have to get involved in research, he said. "Students come to Stanford for the caliber of the faculty, and they should be exposed to it. If not, we're no different from any other institution."

Not only should students have the time to get involved in research, but faculty should be encouraged to employ students and use grant funding to pay them, Ciaranello said. In light of declining federal support, he explained, this would help students financially. "We have a good, untapped source of funds that's already here.

"We have to attract the best students quickly, give them a good curriculum allowing them enough time to participate in research, and offer the opportunities to do so," Ciaranello concluded.

The Senate, formed in 1968 to represent all departments of the Medical School, meets monthly. Besides Ciaranello, Committee of Five members include Drs. Robert Lehman, professor of biochemistry; Frances Conley, assistant professor of surgery; Bruce Parker, associate professor of clinical radiology; and Errol Friedberg, associate professor of pathology.

—Shirley Kraus

Special events and films planned for second annual safety faire

Ever wish you knew more about preventing crime in your home, or that you were better prepared for accidents and earthquakes?

The Hospital's second annual safety faire, to be held the week of Oct. 18-22, should help answer these questions and more. All members of the community are invited to attend the specially planned activities.

A different presentation will take place each day of the week, in the corridor outside the main center cafeteria:

• Monday is "Health Awareness Day," 10 a.m. till 4 p.m., with exhibits by the Pharmacy and Dietetics Department. The American Red Cross and Stanford Heart Disease Prevention Program will present exhibits on their specialties.

• Tuesday is "Attack on the Back Day: The Stanford Back Trak," 7 a.m. till 5 p.m., to consist of a self-guided exhibit made up of several stations. These will include: question and answer board, anatomy, posture, body mechanics, lifting, self-analysis, and handouts.

• Wednesday will feature "Patient, Employee, Chemical, Radiation Safety," from 10 a.m. till 4 p.m. Presentations will be made on radiation and chemical safety, hazardous wastes, and safety with sharp objects.

• Thursday is "Disaster Preparedness Day," from 10 a.m. till 4 p.m., with exhibits covering the 1906 earthquake, HAM radio operations, laboratory disasters, numerous handouts on earthquake preparedness, plus a presentation by a renowned luncheon speaker.

• Friday will feature "Fire/Electrical/Rape Awareness/Protection in the Home," from 10 a.m. till 4 p.m. Displays by the Palo Alto Fire Department will include use of fire extinguishers, smoke detectors, and fire hazards at home. Fire extinguishers will be available for purchase. The Security and Clinical Engineering Departments will have displays pertaining to their services. "Blow the Whistle on Crime" is the personal security theme for the day.

Film presentations during the week will include "Hospitals Don't Burn," "Rape: Preventive Inquiry," "Look Before You Eat," "Heimlich Maneuver," "Code 101," "CPR," "Code 10—Bomb Threat," and "General First Aid."

Showings will be continuous from noon till 8 p.m. on Wednesday, Oct. 20, in the Hoover Pavilion, room NC09; and from 10 a.m. till 8 p.m. Friday, Oct. 22, in the main center, room W003.

The faire is presented by the Hospital's Environmental Health/Safety Committee. Training sessions meet the in-service requirements of the Joint Commission for the Accreditation of Hospitals.

Department heads and supervisors are encouraged to allow their staff time to attend the week's events and films. For further information call Hilary Ryniewicz, at 497-7224.

Dr. Scott Wood, the third and newest member of the Stanford Medical Group (SMG) gives an injection to patient Betty Lovelace, recreation therapist in Pediatrics. SMG, a practice group under the Department of Medicine, recently accepted the medical contract for Personnel Health Services. Wood came to Stanford from a position as instructor of emergency medicine at The Johns Hopkins Hospital, Baltimore, and is working half of each day in Personnel Health. He said his half-time duties include physical screening of new SUH employees, urgent treatment of workers on the job, and screening of work-related health absences. Afternoons will be spent seeing patients at SMG, which last month celebrated its first anniversary. Co-founder Dr. Michael Jacobs said the group, intended to serve "people who want to be treated at Stanford without direct student contact" in outpatient care, currently serves about 300 patients each month. The third physician is Dr. Armand P. Gelpi.

NCCP symposium on drug resistance

A symposium on the mechanisms of resistance to anticancer drugs will be held from 9 a.m. till 3 p.m. Saturday, Oct. 23, in the Fairchild Auditorium at Stanford University Medical Center.

The second in a series of one-day symposia sponsored by the Northern California Cancer Program, the day's discussion will focus on alkaloids, antibiotics, and alkylating agents. Advance registration is encouraged.

Specific topics addressed will be "Overproduction of a plasma membrane glycoprotein in multi-drug resistance," "Multiple drug cross-resistance in mouse neuroblastoma cells," "Alkaloid resistance and cross-resistance in human leukemia cells," "Mechanisms of resistance to bleomycin," and "Mechanisms and modulation of resistance to alkylating agents."

Dr. Branimir Ivan Sikic, assistant professor of medicine (oncology and clinical pharmacology), will co-chair the event with Dr. George Stark, professor of biochemistry, and Dr. Victor Levin, associate director of the Brain Tumor Research Center at U.C.S.F.

Speakers will also include Drs. J.R. Riordan (visiting from University of Toronto, biochemistry), Fred Baskin (University of Texas), William Beck (St. Jude's Children's Research Hospital), and J. Martin Brown, associate professor of radiology at Stanford.

A box lunch, courtesy of NCCP, will be served. The symposium is supported in part by a grant from Adria Laboratories. For further information contact Martha Kaplan, at 497-7431.

Dying girl to go home soon

A fund raising effort to help a 12-year-old Sri Lankan girl who is dying of a malignant brain tumor and her family return home for her death has been largely successful, according to SUH social worker Susan Weisberg.

"We think now that sufficent funds for the patient's transportation have been raised," Weisberg said at press time.

Approximately $14,000 was needed for the girl's trip back home, which will include one or two attendants' rountrip fares, a stretcher, and ambulance fees.

The youngest of seven children, Ayesha Cader will remain bedridden in the Hospital until she is transported home, which has been her family's greatest wish since her cancer was declared inoperable.

The money to allow Ayesha's return home was raised from various sources, including the family's severely dwindling resources and about $2,000 to $3,000 from the Sunshine Foundation.

Last week the McDonald Owner/Operators Association of the Bay Area agreed to match dollar for dollar public contributions towards the remaining amount of money needed, estimated at approximately $7,000. In other words, $3,500 donated by the public would be matched by an equal amount from the burger mavens.

Weisberg said that the public's response to a media drive on behalf of the Cader family has been extremely generous.

Ayesha Cader arrived in the U.S. Aug. 23 with her mother and father, Khyre and Hanza. A doctor in her native Colombo, Ceylon, felt that she could be cured here with surgery, radiation, chemotherapy, or a combination of these.

However Dr. John Hanbery, professor of neurosurgery, found that the girl's tumor was too advanced for successful treatment, though radiation therapy was given for two weeks. Ayesha was taken comatose to the Emergency Room on Sept. 18 and admitted to the Hospital.

Though the necessary funds have been raised to transport Ayesha home, contributions are still being gratefully accepted to help with expenses. Anyone interested in making a contribution should contact Joan Marinaro, at 327-4800, ext. 500.

Medical Faculty Opening

Stanford is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

The department of neurology at Stanford University School of Medicine is recruiting faculty members in both adult and child neurology for positions available in the coming academic year.

Candidates should be qualified for examination by the Board of Neurology and Psychiatry in adult or child neurology. Preference will be given to individuals with significant skills as teachers and clinicians who have had sufficient training and experience in clinical or basic research areas to function as independent investigators.

Particular areas of interest might include clinical neurophysiology (EEG-EMG); neuropharmacology; neuroanatomical studies in relation to neurological disorders; or others. Appointments will be made at the assistant professor or more senior level, depending upon qualifications.

Interested individuals should send a curriculum vitae and the names of three referees to: David A. Prince, M.D., professor and chairman, Department of Neurology, Stanford University School of Medicine, Stanford, CA 94305.

Wanted: Research Subject Volunteers

The Sleep Disorders Research Center is seeking five to ten volunteers aged 55 to 70, with sleep problems, to participate in a study.

The purpose of the experiment is to compare sleeping medications in regard to their effects on daytime alertness.

Research assistant Sue Cohen said participants must be willing to take sleep medication and remain a total of nine nights and eight days in a lab. The session will run from Oct. 18-30. Participants will be compensated.

Insomnia sufferers are particularly sought, Cohen said, while persons with narcolepsy, apnea or other long-term chronic disorders will not be accepted.

For further information, physicians and interested persons should call 325-4697.

Anesthesia staffer 'foolhardy' enough to enjoy busy life

Mary Davis Smith, assistant to the manager of the Medical School's department of anesthesia, believes she works in "one of the better departments," making the commute from her home in south Sunnyvale worthwhile.

"If there were awards to give, my boss would get one," she said.

Her boss, Dick Davis, administrative service manager of the department, thinks she's an ideal employee also. "She does a fine job. She's helped the department a lot, and she's helped me a lot also," he said.

So when Smith asked Davis if she could work half-time following the birth of her first child about a year ago, Davis was more than willing to accommodate her.

As such, Smith spends her mornings doing the accounting for the department. Her work at the office, however, which handles all the administrative, monetary, and non-academic areas for the department, is just one of many activities that fill Smith's days.

One of the third generation of her family born and raised in Redding, Smith didn't move to the Bay Area until 1970.

"I came to visit my brother who works at SRI," she said. "I liked the area and the weather, so I stayed."

She started working at Stanford in another office, but a year later she transferred to the Anesthesia Department. At just about the same time she learned how to ski.

"I went gangbusters," she said, laughing.

And sure enough, two years later she joined Heavenly Valley's ski patrol, which requires superior skill and extensive, rigorous training. "I was one of the first women on the patrol," she said. "But the men watched out for me."

Not that she needs watching out for. Smith said she "pulls her own weight" up on the mountain, where she spends many of her weekends each year, especially during the winter. Long before each season begins, however, Smith joins her fellow patrollers for refresher courses in cardiopulmonary resuscitation (CPR), advanced first aid, mountaineering, and more.

On the ski patrol: "It's not all fun and games. . .we're the first ones up the mountain in the morning and the last ones down at the end of the day."
—Mary Davis Smith

"Its not all fun and games," she said. "Often the weather's not as nice as we'd like it to be. Some people are ungrateful. Regardless, we're the first ones up the mountain in the morning and the last ones down at the end of the day."

But the hardships don't discourage Smith from skiing, nor does the time commitment discourage her from doing other things.

She and her husband, a fellow native of Redding whom she met a few years ago during a ride home to visit family, are renovating a 50-year-old house in which they've lived for two years. They're doing everything, from replacing the plumbing and the windows to rewiring the electric system, by themselves.

"We're learning as we go," she said. "We've always dreamed of redoing a house, but I'll never do it again."

The house is on a quarter acre of land, which gave Smith ample room to grow a vegetable garden. "I grow pumpkins every year," she said. "I used to bring some vegetable into the office too."

When she isn't working on the house or in the garden, Smith works in the house, doing stitchery. "I've made baby quilts for just about all my friends who have had babies," she said.

Smith gave birth last year to her boy, Andrew Tyson, nicknamed 'J.K.'. "When I was pregnant I had amniocentesis so I knew it was going to be a boy," she explained. "Everyone wanted me to have a name for him. I had no idea, so we just started calling him J.K. for 'just kid.' And it stuck."

J.K. already keeps Smith company on bicycle rides around town, and will most likely soon join her in other activities like backpacking, hiking, snow camping, abalone diving, and water skiing.

Often the only woman in her circle of friends who is involved in some of these activities, she explained, "I'm the only one who's foolhardy enough. But I'll attempt anything."

—Shirley Kraus

Parking reminder

Medical Center employees who have mailed in their parking applications but not picked up their stickers are requested to call the parking office (E015) at 497-6678, or to promptly pick up their stickers there.

Ramona Kelley, business manager of the Department of Public Safety, said that stickers will *not* be individually delivered through interdepartmental mail. And last year's stickers have already expired.

Those who have never received an application should go to E015, located across from the Credit Union in the basement of the Hospital, and purchase their parking stickers.

Citation will begin on all lots Tuesday, Oct. 19, Kelley said.

...News Notes...

Ken Jensen is resigning from his position as Controller of the Faculty Practice Program effective Oct. 28, announced Donald B. Tower, FPP executive director.

Jensen will assume the position of director of finance for Children's Hospital at Stanford.

* * * *

Windell K. Smith has been appointed supervisor, regular accounts receivable/follow-up, announced John C. Sidun, manager of regular accounts receivable, patient accounting. Smith comes to Stanford from the University of Missouri, Columbia, where he was supervisor of the insurance department.

He will be working with the patient accounting representatives and financial counselors, and will be assisting with the conversion of the patient accounting system. He can be reached in F06, and his phone number is 497-5511.

* * * *

If one of the paintings on the walls of the Hospital's hallways has caught your eye, you'll have the chance to bid for it at the Palo Alto Art Club Harvest Sale and Auction, Sunday, Oct. 17.

Aside from the paintings, there will be pottery, antiques, and other goods up for sale. A preview is scheduled from 1-2 p.m., and the auction from 2-4 p.m.

* * * *

Tom Rindfleisch, who has been director of SUMEX since its inception in 1974, has been appointed director of the Heuristic Programming Project. He will also become more involved with research. He is currently a member of a new project team working on Advanced AI Architectures.

Ed Pattermann is the new director of SUMEX. He came to Stanford from Lawrence Livermore Labs, where he worked on local area networks. He also worked as head of computing resources in the Texas Instruments AI group.

* * * *

John Silva, of the Transport Service, has retired from the Hospital after 13 years of service. Silva is known to most employees as the friendly courier driver who shuttled passengers back and forth between Hoover Pavilion and the main center.

Silva, who was recently on a leave of absence, received the first "safe driver award," issued by Dr. Thomas Gonda in 1972. In 1977 he was nominated for the Gonda Employee of the Year award. In 1980 he was again nominated, and received a special award and formal congratulations for his ongoing contributions to the Hospital.

* * * *

Hospital employee Marge Smith handled the Nursing Department paychecks and timecards for the last time Oct. 1, ending a 15-year career at SUH. During her tenure the Nursing Department nearly tripled in size and complexity.

Now that she's retired, Smith and her husband Bill will be moving from Palo Alto to a home in Mi-Wuk Village, near Sonora, which they have been building for 16 years.

Dr. Robert Cody, a clinical associate professor of medicine at Stanford, has been named vice chief of staff at Mills Memorial Hospital in San Mateo.

* * * *

Recently appointed director of the regional burn unit at Valley Medical Center in San Jose is Dr. Ronald Sato, an assistant professor of surgery at Stanford.

* * * *

SUH emergency room physician Michael Bresler, clinical assistant professor of surgery (emergency medicine), has been elected secretary of the California Board of Directors of the American College of Emergency Physicians.

* * * *

"Sam Cooper's Capers," an original musical review written and directed by Dr. Bradford Young, a Stanford Medical School alumnus (class of 1945), will be presented at the Bohemian Club in San Francisco, Nov. 13-14.

The review is part of a centennial celebration of the historic Clay and Webster Street site in San Francisco that housed Stanford's medical school until 1959. It is now Pacific Medical Center.

Cooper's Capers humorously looks at the last 100 years of health care, medical education, and other events at Clay and Webster Street—through the eyes of Dr. Elias Samuel Cooper. Dinner and cocktails precede the show.

Ticket information is available from the sponsor, Pacific Medical Foundation, at 931-5528, the public relations department, 563-4321 ext. 2231, or from Stanford's medical alumni office at 497-5064.

Young (right) rehearsing one of his past productions, "Clay Street Blues."

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Three prominent figures in physical therapy, alumnae of Stanford's division themselves, visited a Stanford class of P.T. students last week to address the topic "Historical Perspectives on Physical Therapy." Catherine Worthingham (right), who served as director of Stanford's P.T. division from 1939 to 1946, was responsible for starting the first advanced degree program in P.T. in the country. Lucille Daniels (left) succeeded Worthingham as director of Stanford's division, a position she held for about 25 years. An annual award in her name is given to whomever P.T. students select as having contributed greatly to their education at Stanford. Sarah Semans (center) taught full-time in the Stanford program for about 25 years. She still teaches one course in the division, and has written several articles on the treatment of cerebral palsied children and adult hemiplegia. Incidentally, this week of Oct. 11-17 is Physical Therapy Week in the state.

Average tenured faculty member is now 45.8 years old

continued from page 1

has risen to 114 from 52; in the National Academy of Sciences, to 75 from 38; in the National Academy of Engineering, to 37 from nine; in the National Academy of Education, to nine from four.

During the past decade, the total Pulitzer Prize winners has risen to three from two, Nobel Laureates to 10 from six, and National Medal of Science recipients to 11 from three.

Where several other major universities appoint tenured faculty from outside their institution, Stanford tries to identify, train and promote more of its own young talent, Kennedy noted.

Last year, only 15 percent of the Stanford faculty appointments were made at the tenure rank—85 percent were assistant or nontenured associate professors. The corresponding figures five years ago were 25 percent tenured, 75 percent nontenured; 10 years ago, 13 percent of the appointments were tenured, 87 percent nontenured.

"Searches for nontenured faculty are conducted with great care, and we expect to retain and promote between a third and a half of them," he noted. Among those appointed in 1973-74, for example, 46 percent were retained. Compared to those who received their first appointments in 1963-64, there was a modest drop (to 37 percent from 48 percent) in the proportion retained in non-medical areas, balanced by an increase in the promotion rate for medical faculty.

By making careful appointments of young faculty, "the average quality of the faculty at any given moment is higher," Kennedy said. Nontenured faculty sense they have a solid chance of staying, and become more interested in building durable programs of teaching and research.

In addition, "more of our senior faculty (have) their productive research years at Stanford, with all the advantages that continuity and stable affiliation can confer."

This practice may prove "more and more difficult to sustain," he warned.

"Over the past decade, the slackening of federal support for research and scholarship, the rapid inflation of costs, and the failure of private gift sources to keep up with either, have forced an equilibration of faculty size.

"After two decades of rapid growth, the tenure line faculty at Stanford during the past 10 years has increased at the rate of only about one percent per year. That effect has been augmented by the legislated increase in mandatory retirement age from 65 to 70.

"The result has been a significant and alarming shift in the tenure ratio and in the average age of Stanford faculty. In 1971, we were 42.7 years old and 65 percent of us were tenured. Five years later, the average age was 43.5 and the tenure proportion up to 68 percent. Now the average age stands at 45.8 and the proportion tenured at 72 percent.

"An extrapolation of those trends suggests how very difficult it will be to keep our promotion rate for nontenured faculty above one-third. And the situation will become very much worse if present legislation to uncap mandatory retirement altogether should succeed."

During the past five years, Stanford faculty salaries have "improved somewhat" relative to competing universities "although we need to be concerned about the gradual erosion in compensation for the professoriate relative to other professions," Kennedy said.

Housing requires "continuing attention," he said. The University's coinvestment mortgage program, which now has $12 million out in faculty loans "should soon have its ceiling adjusted to $20 million," he declared.

Besides being responsible for the recruitment, retention and promotion of professors, "the faculty sets the intellectual and social conditions for colleagueship that will determine how attractive an environment this is," he said.

"It is up to us administrators to make sure nothing gets in the way. Stanford has extraordinary advantages—vastly improved resources and environments for scholarly work, a superb student body, a splendid location, and an increasingly powerful tradition of accomplishment."

Typifying Stanford's record of "growing its own" faculty on the Farm, Kennedy joined the University 22 years ago as an assistant professor.

Med Center Calendar

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, OCTOBER 13

School of Medicine Basic Science Research Colloquium: "Development of Functional Synaptic Connections Between Eye and Brain"—Dr. Carla Jo Shatz. 5 p.m., Fairchild Auditorium.

THURSDAY, OCTOBER 14

Dept. of Pharmacology Seminar: "Characterization and Identification of ACTH Receptors"—Dr. J. Ramachandran (UCSF). 4:15 p.m., R358.

FRIDAY, OCTOBER 15

Dept. of Gynecology and Obstetrics Grand Rounds: "Continuous Non-Invasive Measures of Multiple Fetal Blood Gases in Labor"—Dr. Gary Sykes (Oxford). 8 a.m., A336.

Dept. of Pediatrics Grand Rounds: "Group B Streptococcus Infection in the Newborn"—Dr. Anne Yeager. 8 a.m., M106.

Dept. of Physiology: "Renal Glutamine Metabolism"—Prof. Daniel O'Donovan (University College, Galway, Ireland). 5 p.m., M110.

Dept. of Dermatology Medical Science Education Lecture: "Inherited Disorders of the Skin as Studied by Electron Microscopy"—Dr. Ingrun Anton-Lamprecht (University of Heidelberg, W. Germany). 8 a.m., Dermatology Library, R136. Sponsored by The Upjohn Pharmaceutical Company.

OCTOBER 18 THROUGH 22

Second Annual Safety Faire: Sponsored by the Hospital Environmental Health/Safety Committee. See related article in this issue for details.

TUESDAY, OCTOBER 19

Dept. of Biochemistry Colloquium: "Molecular Mechanism for Nitrogen Regulation in Enteric Bacteria"—Dr. Sydney Kustu (UC Davis). Noon, M114.

WEDNESDAY, OCTOBER 20

Dept. of Pathology Basic Research Colloquium: "Cloning of DNA Repair Genes from Caccharomyces Cerevisae"—Dr. Errol Friedberg. 5 p.m., Fairchild Auditorium.

SATURDAY, OCTOBER 23

Fifth Annual Conference on Child Development: sponsored by Dept. of Pediatrics. 8 a.m. till 5 p.m., Kresge Auditorium.

WEDNESDAY, OCTOBER 27

Puberty Education: "What's Happening to Me." Course for boys and girls (ages 10-12) and their parents. First of two sessions, 7:30-8:30 p.m., Children's Hospital at Stanford. For registration and information, call Dr. Paula Duke at 327-4800, ext. 538. Series repeated beginning Wednesday, Nov. 3.

Calendar items must be received in the Office of Public Events, 800 Welch Road, Suite 221, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

CIR...

continued from page 1

resulting recommendations will be considered by the trustees at their December meeting.

While unanimous in their basic recommendations, the commission members held "different and incompatible positions on. . .underlying principles and perspectives," the report notes. As one CIR member put it "we are dealing with problems of both theology and finance," as well as education and public relations.

Seven members, mainly students and faculty, argued that the proxy process has "distinct, if often intangible influence on corporate behavior and on public education on the issues involved."

But the large number of shareholder resolutions and the limited time available for their analysis do not permit analysis needed for "an informed and thoughtful judgment."

Careful consideration of allegations is "vital," they added. "Thorough research, thoughtful analysis, and adequate deliberation deserve greater weight than reaching for a large scope of proxy activity."

Letters, visits

Direct representations to management, either by letter or by visit, "tend to yield more information and may provide opportunities for more substantive dialog" than proxy voting, the majority said. "It may produce a greater and more direct impact on corporate management. It may also provoke a more intense reaction. . . .

"If experience is any guide, the actual impact of divestment—other than in terms of publicity—tends to be minimal. This is particularly likely to be the case where—as is true of virtually all of Stanford's holdings—an investor owns only an insignificant fraction of a company's stock.

"Divestment remains the simplest, most direct, and final action to be taken. It clears the university of moral complicity with 'substantial social injury.' It also precludes further effort to alleviate the harm done. It is therefore bound to appeal to those concerned with the standards of a 'clean portfolio,' not to those interested in exerting their influence on behalf of desired change.

"The case for divestment is bound to be strongest where the injury caused is severe, and has been persistent over time, and where efforts to induce change have failed or promise no success."

Besides Dallin, who heads the international relations program, those joining in this view were Profs. W. Bliss Carnochan. English, and Lincoln Moses, statistics; students Wayne E. Cooper, E. Glynn O'Donnell, and Kenneth E. Perez; and staff member Ellen Oppenheim. University Treasurer Rodney H. Adams, an ex-officio, nonvoting member, also agreed.

Adams also joined with three alumni—Peter S. Bing, former trustee president, James Ware and Marian Zentmyer—in a minority statement favoring the elimination of proxy voting by Stanford and substituting "very selective divestment in those unusual cases in which continued corporate actions result in substantial social injury.

"We believe proxy voting has unwisely entangled the university in social issues on which it is inappropriate to take an institutional position, and has required Stanford to participate in a proxy process that is both political in nature and ineffective in result. . . .

"Moral and political issues are not matters for institutional doctrine established in the trustee board room, but rather the subjects for individual study and expression. Trustees must remove any obstacle to free debate, no matter how small, and certainly must avoid creating one.

"They must particularly protect those who, due to lack of tenure or firm base of support, may hesitate to express a view contrary to established university doctrine.

"An official trustee position on extraneous political and social matters may have a chilling effect on the very expression of views by faculty and students that the university is organized to protect. Such a risk, however small, is unacceptable."

The majority report, in contrast, said that while the university should strive to avoid taking political positions "we find it entirely proper for the university to acknowledge that it has a social responsibility—and that it must practice it—which flows from its moral foundations.

"We find the trustees' choice of 'substantial social injury' a wise criterion to apply to corporate behavior; whatever the problems in its application, it provides a uniform foundation which is ethically unassailable and as remote as possible from political partisanship."

Considering a response to shareholder proposals, the minority said, the CIR should focus on the actions of a corporation, rather than the social importance of the issue. "The CIR should only evaluate charges that a company has willfully or knowingly, and directly, caused substantial social injury and failed to take any action to eliminate or reduce it."

In cases where this is shown, "representations to management or nonbinding votes by less than 10 percent of the stockholders are not likely to be effective," the minority said.

"Divestiture itself, if carefully carried out, will not violate fiduciary responsibility or harm the university." Where this was once viewed as the ultimate shareholder weapon against management, "as it turned out, in those instances in which universities did divest, even with publicity, there was no effect on either the price of the stock or the corporate practice in question.

Use of divestiture

"Stanford should not use divestiture as a political tool intended to change corporate behavior, but rather as a means of eliminating an investment that no longer meets the university's standards of profitability, ethics, etc.

"Stanford owns less than one one-half of one percent of any corporation in which it holds stock." The portfolio balance could be preserved simply by replacing the stock with a more responsible company in the same industrial group.

"Divestiture without publicity would not make Stanford legally liable for intentionally hurting a corporation, nor would it allow the university's investing practices to be used for partisan social purposes," the minority said.

Oppenheim and fellow staff members Iris Brest and Larry N. Horton, joined in a second minority statement that the commision's primary function should be "screening putative instances of substantial social injury."

They said the proposed procedures were well designed "to select the few situations calling for fuller investigation that may lead to recommendations for action. . . .

"The activity of the commission will be limited to issues truly involving substantial social injury. . .not a forum for consideration of the popular political and social issues of the day."

University Trustee Frank Lodato served ex officio on the commission, while Stephen Peeps provided staff support. Prof. Otis Pease of the University of Washington History Department, a former Stanford faculty member, now heads the Trustee Special Committee on Investment Responsibility, which will review the commission's recommendations.

During the moratorium, the commission held 16 meetings, including one with six former heads of the commission. It reviewed extensive literature on investment responsibility, including *The Ethical Investor*by John G. Simon, Charles W. Powers, and Jon F. Gunnemann and policy documents produced on other university campuses in the 1970s.

Despite repeated advertisements in three campus publications soliciting opinions, expressions of concern or questions from the campus community, it received no responses.

The Board of Trustees adopted an initial statement on investment responsibility in 1971 and a revised document in 1977. That same year, 294 students were arrested in a peaceful protest against investments in South Africa, the first major demonstration of its kind on that issue nationally.

The main portion of the commission's recommendations will be published in *Campus Report*, the University's weekly newspaper for faculty and staff members, on Oct. 13.

STANFORD STAFFERS' 1982-83 officers are (l. to r.) bottom, Jean McMillan of Chemical Engineering, first vice-president; President Betty Hummer of the Anthropology Department; top, Medical Center staff member Lynn Halpern, recording secretary; and Elizabeth Rafferty of Political Science, treasurer. The Staffers, with monthly lunchtime meetings on Tuesday (usually), is open to all Stanford employees. A variety of activities is planned for meetings this year—speakers, campus tours, and even aerobic dancing, which is happening today (Oct. 13) in a rare departure from the Tuesday meeting day.

Commission says Stanford usually should not vote on shareholder proxies

Following is a report of the Commission on Investment Responsibility, Sept. 15, 1982:

Introduction

On September 15, 1981, the Board of Trustees modified the charter of the Commission on Investment Responsibility (CIR) to permit a one-year moratorium on its normal consideration of shareholder resolutions, and to have it under take instead a "comprehensive review. . .of the goals, procedures, and mechanisms for ethical investment by the university." The present report is the result of this review, conducted during the past academic year.

Recommendations

The Commission reaffirms Stanford's commitment to be an ethical and responsible investor; believing that the University should do only that which it can do well, the Commission favors limiting the scope of its consideration of shareholder resolutions to a number on which informed and responsible judgments can be made; and submits the following recommendations:

1. The Commission on Investment Responsibility shall continue in existence, with its composition remaining as now defined. Within the framework of its charter, the CIR shall have sole determination over its workload and agenda.

2. The CIR shall consider only instances in which there are allegations of substantial social injury resulting from corporate behavior. The CIR may consider written allegations against any firm in which Stanford has long-term investments, whether from shareholder resolutions or from any other source.

3. Before any recommendation may be submitted by the CIR to the Trustees, the Commission must have gone through the following decision-process: 1) a screening process to determine that the instance being considered is one of substantial social injury and that the Commission wishes to pursue it further. An affirmative vote of the majority, a quorum being present, will be required for a matter to be considered further; and 2) a matter that has passed the screening vote may be considered by the CIR. In this case, after such research, study, and deliberation as is deemed appropriate by the CIR, a recommendation can be made to the Trustees, provided that no recommendation can be made by the CIR unless it is approved by two-thirds of the entire voting membership of the Commission. Recommendations may call for voting Stanford's shares in shareholder resolutions, making representation to management, divestment of securities, or other action as the CIR deems appropriate.

4. In the absence of a recommendation by the CIR, the Trustees shall normally not vote any shareholder proxy involving social issues.

Statements by Commission Members

Introduction

The members of this Commission adopted the recommendations contained in the body of this Report by unanimous vote. While we are gratified by this result, it must not conceal the fact that members of the Commission came to occupy different and incompatible positions on a number of underlying principles and perspectives. We believe that these differences are indicative of the complexities involved in coming to grips with the problems of investor responsibility. As one member of the CIR put it, we are here dealing with problems of both theology and finance (and, it might be added, of education and public relations as well). We are challenged to take positions on the social responsibility of the university, on the application of ethics to shareholder resolutions, on the propriety of symbolic action, and many difficult problems more.

Under the circumstances, it is entirely natural that members of the University community would disagree. Indeed, we are grateful that Stanford provides a hospitable environment in which to air such competing visions of the university.

Wishing to convey something of the range of alternative views and the richness of the discussions this past year, the CIR decided that it was preferable to have its members express their several points of view in signed statements, rather than manufacture a single, bland and necessarily inadequate "compromise" document.

Statement I

I. The University: Neutrality and Morality

Is it proper or necessary for the university to act as an ethical investor? How to answer this question will depend in large part on our view of the nature of the university and its social role. Enough has been said and written on this subject in recent years to recognize that different positions regarding it may legitimately be held.

The place of the university in society has changed remarkably over the course of this century. For better or for worse, the contemporary American university has become a major institution interacting in a great variety of ways with society and other major institutions—including those of government and the corporate worlds. It has moved irreversibly (to quote the title of a superb analysis by a Stanford alumnus) "beyond the ivory tower."[1]

Yet recognition of this trend does not provide the answer regarding the university's social responsibility—the answer to the dilemmas inherent in the tension of town and gown—in Kingman Brewster's apt phrase, the tension "between the imperative of university neutrality and the imperative of university morality" in regard to the society within which it operates.

On the one hand, institutional neutrality has properly been seen as a precondition for the practice of academic freedom by members of the university community. On the other hand, the claim to university autonomy from the society at large has rung more and more hollow as campuses have accepted government funds for training, research, and construction; have abolished ROTC; have practiced affirmative action; have invested in scores of corporations; have solicited funds from individuals, foundations, and companies; have been landlords, employers, and tax payers.

Education and research must remain the primary functions of the University. It is by promoting these purposes that it can best serve society. Training and research have both benefited from the protected and privileged status that society has (often) granted the university.

The dangers and costs of converting the campus into a service station for outside interests —whatever their nature—have been amply recognized. But we do not believe that the university's pursuit of socially responsible behavior and, in particular, the unavoidable exercise of its obligations as a responsive and ethical investor requires a forfeit of the essential neutrality of the university environment.

Academic traditionalists seeking maximum detachment from the world beyond our gates and social activists striving to marshal the university's resources on behalf of social change—as well as those who occupy the many intermediate positions—have competing visions of the university, which reflect different values, choices, and trade-offs.

While we acknowledge that (except in most unusual circumstances) the university should strive to avoid taking political positions, we do find it entirely proper for the university to acknowledge that it has a social responsibility—and that it must practice it—which flows from its moral foundations. Some of us find that responsibility both essential in its own right and also important as part of the values we would wish to see shared by the university community. The principle and the practice of ethical investment responsibility follow from this approach.

And while we recognize the possibility of confusion at the margins, the distinction between ethical and political choices is clear: we find the Trustees' choice of "substantial social injury" a wise criterion to apply to corporate behavior; whatever the problems in its application, it provides a uniform foundation which is ethically unassailable and as remote as possible from political partisanship.

Compared to individual owners of stock, the trustees of a university are under obvious constraints in the use of the institution's resources. The purposes to which investments may be put are circumscribed by the primacy of fiduciary responsibilities; by law, the trustees must follow what has been called the "prudent man rule" and its aim of preserving for future generations the assets of the institution. Nonetheless we are satisfied that competent legal opinion has assured the University that it is proper for the Trustees to give independent weight to ethical considerations in corporate behavior, both in shaping their investment policies and in voting shareholder resolutions.

We do not share the view that the University has no business involving itself in corporate management by voting proxies (lest it open itself to similar scrutiny and involvement by corporate officers); not only is this argument logically faulty, but it assumes a segregation between the university and the world around it which, if it ever existed, has passed.

And insofar as the university has entered the marketplace in quest of profit, to that extent it can no longer lay claim to innocence. Its participation, like any other investor's, in the regular process of communicating with management is a necessary and legitimate outgrowth of its activity in the marketplace. To refuse to vote proxy resolutions is as much of a statement as voting them.

If there are costs involved in such an orientation, they strike us as much less substantial than the costs of the opposite course, namely, of the University's turning its back on questions of substantial social injury ostensibly caused by corporations in which the University has long-term investments. As a matter of its own integrity, such a position would be intolerable.

We are thus comfortable with a reaffirmation of Stanford's commitment to be an ethical and responsible investor.

II. The University and Voting Shareholder Proxies

The 1970s saw an unprecedented growth of citizen concern with the effects of corporate behavior on social issues. One form this interest has taken is what has been labelled "the resurgence of shareholder participation."[2]

Non-profit institutions have played a particularly active part in introducing resolutions to be voted on, if not at stockholder meetings, then by proxies mailed to all stockholders.[3] Virtually all private universities have moved to establish procedures to regularize their responses to such shareholder proxies. Stanford's policy was set by the 1971 and 1977 Statements reproduced in an enclosure to this Report.

Why should we vote shareholder proxies? We find that essentially the motive is a moral one. We are not impressed by the assertions of the futility of the enterprise. First, we do not believe that the evidence concerning its ineffectiveness is so clear or so sweeping as some critics of proxy-voting have averred it to be. On the contrary, it would appear that the process has had a distinct, if often intangible, influence on corporate behavior and on public education on the issues involved.[4] And second, a calculation of effectiveness of Stanford's participation is ultimately not germane to the determination of university policy.

To be sure, there are differences among those who favor the application of such a moral criterion.

Some, focusing on the impact of ethical investment within the university community, would be primarily concerned 1) with the need for Stanford to have (and to appear to have) "clean hands": not be tainted by a putative complicity in inflicting "substantial social injury"; or 2) with the educational impact of applied social concerns and with setting an example.

Others, on the contrary, would argue that the recognition of such a university-centered orientation must not exclude objectives external to the university (such as the wish to see the safe disposal of hazardous wastes or an improvement in racial conditions in South Africa). The latter group might argue that, since the university inevitably has an impact on the world beyond its gates, it has not only the right but an obligation to be concerned with the impact of its presence—including its ownership and investments—beyond the campus.

Normally, we believe, the two lines of argument just outlined are not mutually exclusive. We might think of the internal focus as constituting a minimum standard and the external one as a more comprehensive criterion, in both instances validating continued concern with corporate behavior and share holder resolutions relating to it.

There is no legal responsibility associated with ownership of stock that requires shareholders to vote their proxies. After extensive discussion, we have concluded that there should be a predilection to consider cases of alleged "substantial social injury" (such as those raised in certain share holder resolutions) but not an obligation to vote all proxies involving such allegations.

The major reason for the distinction between considering and voting is a practical one. The experience of the last several years shows clearly that the large number of shareholder resolutions, and the limited time in which they can be considered prior to voting, do not permit the CIR to research and analyze them well enough to make an informed and thoughtful judg ment, and accordingly to make a timely recommendation to the Trustees for the Board to consider. (Indeed, it was this circumstance that last year's CIR stressed in advocating a moratorium to review the entire process.)

We believe that careful consideration of allegations is vital here, as it must be in other parts of the University's enterprise. As a rule, we believe, the requirements of thorough research, thoughtful analysis, and adequate deliberation deserve greater weight than reaching for a large scope of proxy activity.[5]

The CIR should therefore not be bound to complete its consideration of particular allegations, nor to decide upon its response to questions of inves tor responsibility, by a particular deadline if adequate consideration has not yet been completed. It should be obliged neither to react within the limited time available for proxy consideration, nor to wait until the annual cycle repeats itself, if it wishes to make a response of its own. It is self- evident that, given the integrity of those serving on the Commission, such a procedure will not (as it must not) lend itself to procrastination nor to the evasion of difficult decisions.

We devoted some effort to elucidating the notion of "substantial social injury": we could not improve on the formula. The concept proved to be inherently elusive; and because the notion of hazard—a probabilistic construct—is sometimes central, it seems necessary to accept some ambiguity about it. (The thought-experiment of a nuclear plant being deliberately sited on a geological fault is illuminating: substantial social injury may be involved, although if an earthquake never comes there will never be any actual injury.)

We explored the possibility of clarifying the need for rigor and adequacy of evidence required for a finding of corporate responsibility for substantial social injury. We conclude, on balance, that while there is a need for conclusive evidence, the CIR's deliberations cannot take the form of judicial proceedings and the Commission should limit itself to customary academic canons of evidence.

More specifically, four questions have been asked in this connection. 1) Must the injury in question have occurred or may

continued on next page

CIR report/continued from page 15

it be prospective? While the serious likelihood of a future occurrence obviously needs to be shown, it would make no sense to require substantial harm to have actually been done rather than to act to forestall it (thus it would be sensless to require the occurrence of a nuclear explosion rather than to act to prevent it). 2) Must the injury be intentional or may it be accidental? While the case is clearest where intent is manifest, the concepts of "criminal negligence" and "sins of omission" suggest that accidental occurrences need not always be ruled out, especially if the evidence prompts a finding that a pattern of neglect or recklessness was present. 3) Must the injury be inflicted on a collectivity or does a single individual victimized provide a sufficient cause for consid eration? The number of casualties scarcely determines the judgment: a serious violation of regulations, say, governing the disposal of radioactive wastes may not have caused a single victim (or at least none as yet so identi fied), without thereby reducing the company's culpability. And, 4) must "substantial social injury" be the direct consequence of corporate behavior or may it include indirect participation and passive acquiescence in a system found to be socially injurious? This is a bothersome question, as controversy over the role of U.S. corporations in South Africa illustrates.

It can be argued that passive acquiescence may materially nourish and prolong the maintenance of an unjust system. We recognize that opinions may properly differ on this question, and we believe that direct responsibility constitutes a minimum ethical standard, whereas indirect complicity sets a higher one. Future CIRs will wish to examine these questions further.

III. Other Activities

a. Educational Effects and Activities. Some of us believe partici pation in the proxy process and in the consideration of proxies by the CIR provides educational benefits to those in the university community who take part and to those who observe.

It is assuredly part of the business of education to help people engage in ethical judgments. The analysis of the issues raised in the proxies and the evaluation of alternative remedies, where indicated, are instructive in weighing different response strategies when dealing with complex issues.

It is beyond the scope of this Commission's function to make recommendations relating to curricular or extracurricular activities. As a matter of principle the CIR must not urge the Trustees to promote mechanisms that might impinge on the freedom of the University, and its faculty, to set curriculum.

However, most of us believe that it is proper for the CIR to encourage and facilitate the gathering of data, and their analysis and interpretation by members of the University community. For such a purpose future Commissions may wish to associate student interns with the CIR, to have members of the CIR supervise and direct student research (for credit, if appropriate), and to assist appropriate campus organizations (ASSU, SWOPSI, and others) if they wish to sponsor informational meetings, debates, and other essentially educational activities related to the subject of the CIR's consideration.

b. Other Action Strategies. Past experience. both at and on other campuses, has focused heavily on shareholder resolutions as the vehicle to express, when appropriate, concern with or disapproval of corporate behavior. It may well be that this experience has unduly constricted our perspective on the possible range of alternative action strategies. It will be proper to leave to future Commissions the choice among such actions to recommend to the Trustees.

Experience suggests that representations to management, with or without proxy-voting, by either letter or visit, tend to yield more information, and may provide opportunities for more substantive dialogue about the ostensible injury and possible methods of alleviating it. As a more active approach than proxy-voting, it may produce a greater and more direct impact on corporate management. It may also provoke a more intense reaction from management.

Finally, divestment has been envisaged as an important response available to stockholders, ever since investment responsibility emerged as a subject of campus debate—initially, over South Africa. Those favoring divestment saw it as the most effective, and dramatic, action calculated to influence corporate behavior and public opinion. Those opposing it saw divestment as an example of irresponsibility in that the stock sold in such an instance would be pur chased by another investor who was, at best, indifferent to the presumably reprehensible corporate activity that had led to divestment.

If experience to date is any guide, the actual impact of divestment (other than in terms of publicity) tends to be minimal. This is particularly likely to be the case where (as is true of virtually all of Stanford's holdings) an investor owns only an insignificant fraction of a company's stock.

Divestment remains the simplest, most direct, and final action to be taken. It clears the university of moral complicity with "substantial social injury." It also precludes all further effort to alleviate the harm done. It is therefore bound to appeal to those concerned with the standard of a "clean portfolio," not to those interested in exerting their influence on behalf of desired change.

We believe that there is merit in both approaches and we recommend that future CIRs, rather than settling on either course of action, determine in each situation in which investor action is warranted, what course appears to be the most promising. The case for divestment is bound to be strongest where the injury caused is severe, and has been persistent over time, and where efforts to induce change have failed or promise no success.

*Ellen Oppenheim provides the following comment:

'I can support and endorse both Statements I and III, with the caveat that I find their respective prescriptions of "a predilection to consider cases of alleged substantial social injury" and selection for consideration of "only those cases in which the allegations, if true, are morally intolerable" to be so loose as to allow too many issues into consideration (Statement I), and so rigorous as to cause some significant issues of substantial social injury to be dropped without consideration (Statement III). My personal preference with regard to the circumstances in which the CIR should investigate allegations of substantial social injury falls somewhere between these two positions.'

**Rodney H. Adams also endorses Statement II.

Wayne Cooper approved a draft of this statement but could not be reached for approval of the final text.

NOTES

1. Derek Bok, *Beyond the Ivory Tower: Social Responsibilities in the Modern University* (Harvard University Press, 1982).

2. David Vogel, *Lobbying the Corporation: Citizen Challenges to Business Authority* (Basic Books, 1978), esp. ch. 3. The classic discussion is John G. Simon, Charles W. Powers, and Jon P. Gunnemann, *The Ethical Investor: Universities and Corporate Responsibility* (Yale University Press, 1972). For a series of case studies, see e.g., S. Prakash Sethi, *Up Against the Corporate Wall: Modern Corporations and Social Issues of the Seventies* (Prentice Hall, 1971, 1977).

3. The Investor Responsibility Research Center (IRRC) provides an annual compilation of "How Institutions Voted on Shareholder Resolutions" in a given year.

4. Instances of positive impact include the infant formula controversy; the adoption of the so-called Sullivan Principles by a number of corporations doing business in South Africa; a change of policy on giving loans to South Africa by banking institutions. Others support the record of proxies as "keeping their corporate feet to the fire" and as vehicles of public educa tion. See also Bok, *op. cit.*, and Vogel, *op. cit.*

5. We are agreed that once a security passes from Stanford's ownership, so does end our concern for any proxy tied to that security. Most of us are also agreed that the initiation of proxy resolution by the University, while not unthinkable, exceeds any obligations the University may have as a shareholder and, moreover, would be apt to raise a more serious challenge to the maintenance of institutional neutrality.

6. It goes without saying that the taking of positions as expressed in proxy- voting in no sense pre-empts or circumscribes the liberty of any member of the University community to act in a fashion contrary to that taken by the University.

7. We are here leaving out of consideration the legality of divestiture action taken by fiduciaries. While the fiduciary responsibilities of univer sity trustees do permit them to give independent weight to instances of "substantial social injury," they may not buy or sell stock in furtherance of a particular social or political philosophy. This rule also precludes giving serious consideration to the suggestion that Stanford (or other institutions) "reward" certain companies for praiseworthy performance in areas of controver sial social policy, by acquiring their stock.

STATEMENT II

Introduction

The members of this year's CIR had remarkable unanimity on the ethical and moral responsibilities of the university as an investor. No one wished to see Stanford automatically vote shareholder ballots in favor of management, without a thorough consideration of the proposals they contain.

The members disagreed, however, on the best course of action in those cases in which a corporation causes substantial social injury. That disagree ment, and its expression in this and other commentaries, underscores the importance of the university as a neutral forum for debate,.and the need to avoid any actions that might compromise the freedom it permits.

We support the Commission's recommendations because they take a step in the right direction by requiring a more careful scrutiny of a much smaller number of proxy issues. We would, however, have supported elimination of proxy voting, and the substitution instead of a very selective divestment in those unusual cases in which continued corporate actions result in substantial social injury. We believe proxy voting has unwisely entangled the university in social issues on which it is inappropriate to take an *institutional* position, and has required Stanford to participate in a proxy process that is both political in nature and ineffective in result. The Trustees' goal for the university, as an ethical investor, should not be to influence corporate behavior as a means to a perceived social good. Rather, it should be to insure that Stanford does not profit from irresponsible actions, either of its own or of corporations in which it has invested. Considered divestiture accomplishes that objective.

The Nature of the University and the Role of the Trustees

The *raison d'etre* of the university is teaching and research. This is best accomplished in a neutral forum in which students and faculty may openly examine conflicting views, and bring their full talents to bear in making choices among the alternatives. Faculty and students are often at the cutting edge of important debates on political and social issues, and are free to engage in action, as well as expression, in support of their convictions as individuals or as members of voluntary associations.

The university, in which all this can take place, is a unique institu tional form in our society; it is also a highly vulnerable one. It has a minimal hierarchy of authority, and does not present a single, coherent and forceful view on any issue. Academic freedom is granted by society to a uni versity on the understanding that, as an institution, it is not partisan, although individuals within it are free to espouse any cause, Under this social contract, and partly in consideration for its neutrality on political and social matters, members of the university are exempted from outside con trol, and the university itself is granted unique privileges (such as special tax exempt status) and is accorded widespread respect and support.

Preservation of the university, and its character as a neutral forum, is entrusted to Trustees. Their fiduciary responsibility requires them to pro tect the character of the institution and, at the same time, preserve it in perpetuity for future generations. As a minimum, Trustees must:

Exercise prudence in the management of the university's resources and use them only for purposes related to the university's stated mission. Trustees have a legal responsibility to maximize the financial return on the university endowment. They may not buy or sell in order to further a political or social philosophy.

Prevent outside influence, whether political or financial, that would compromise the internal freedoms for faculty and students.

Preserve the integrity of the academic process. Accordingly, the Trustees do not interfere with the determination of student admissions (who is taught), faculty selection and promotion (who does the teaching and research), and curriculum development (what is taught). Equally, the Trustees do not take institutional positions on political or social matters unless they directly affect the educational or research mission of the university. They do not, in the name of the university, participate in any of the political activities in which students and faculty are free to engage as individuals.

While the Trustees are compelled by the university's academic mission to remain neutral on political and social issues, they

continued on next page

CIR/continued from page 16

university's conduct that are socially responsible. Trustees would not knowingly make an investment in a company which flagrantly violates the law, or causes substantial social injury in stubborn disregard of the welfare of society.

In this regard, university policy states that "When the Trustees judge that corporate policies or prac tices cause substantial social injury they, as responsible and ethical investors, shall give independent weight to this factor . . ." Such considera tions take place each year when the Trustees, as shareholders of corporations in which the university has permanent endowment investments, receive their ballots on questions of corporate management.

The Nature of the Proxy Process

Annual meetings of corporations provide to each shareholder, in proportion to the size of his investment in the company, an opportunity to approve or disapprove the activities of the corporation's management by voting a series of proposals on a stockholders ballot. The overwhelming proportion of items submitted to the stockholders for ratification are placed there by the corporation's management and relate to normal business activities. Only a very small percentage of stockholders attend annual meetings. Instead, most endorse their proxies in favor of management, giving it the right to represent them and vote their shares as management has recommended.

In recent years, the opportunity afforded a shareholder to vote on matters of corporate management has been used by those concerned about the social effects of corporate actions. In addition to voting, they have also placed upon the ballot resolutions on broad social questions for which they believe changes in corporate behavior would be helpful. These resolutions are constructed of two main parts: a series of "Whereas" clauses in which the social issue is delineated and allegations are made as to the actions of the corporation that cause or exacerbate the social problem; and a "Therefore" section that proposes changes by the corporation that the proponent of the resolution believes will ameliorate or elimate the social problem.

Shareholder-originated resolutions must be approved by the Securities & Exchange Commission (SEC) to get on the ballot. Part of that approval process involves presentation of the shareholder proposal to management. If manage ment agrees with the proposal, and takes steps in conformity with it, the request to place it on the ballot is withdrawn or not approved. Thus a share holder proposal that does appear on the ballot is opposed by management, and management is fully aware of the allegations it contains.

Shareholder-originated proposals relating to social issues usually receive between three and eight percent of the shareholders' votes. A handful have received as much as ten percent. In any event, the resolutions are advisory to management and non-binding.

The proxy process itself has characteristics that are particularly disavantageous to an academic community:

Ballots, as a medium for expression of opinion, must condense any question to be voted upon, and restrict the solicited opinion to a "yes" or "no." Complex and controversial social issues, such as nuclear power or repression of different types in different countries, cannot be reduced to simple questions on which a meaningful yes-or-no vote can be taken. Similarly, no action by an individual corporation can correct a broad social problem in its various manifestations throughout the world. It is particularly inappropriate for an academic institution to align itself with simplistic judgments.

Recognized experts disagree on both the nature of, and the solutions to, complex social problems. A proxy vote must side, without qualification, with one particular view point. Thus by taking an institutional position through widely publicized proxy voting, Stanford reduces or precludes the opportunity for knowledgeable individuals within the institution to contribute their opinions and data to the public debate.

There is insufficient time to understand the questions and evaluate the proposed solutions. Shareholder proposals are made available to stock holders only a few weeks before the annual meeting at which time they must be voted upon. Thorough and responsible consideration is an indispensable element of academic process. The superficial investigation and hasty conclusions necessitated by the timing of proxy votes oblige Stanford to make judgements based on inadequate study.

In addition to the logistical problems, proxy voting establishes a *defacto* university position on all sorts of social issues unrelated to education in general or Stanford in particular. Precedent is created by Stanford's accumulated voting record and is, in fact, referred to in its own letters to corporate management justifying its vote in certain instances (e.g., letter to International Harvester dated February 26, 1981). And the votes themselves, although cast in the name of the Trustees, are viewed as representing a con sensus of the university community.

Through the CIR, Trustees are advised by a broadly representative, campus-based group. Trustees explain, by means of a public statement that is printed in the *Daily*, any vote that deviates from a recommendation of the CIR. The understandable tendency to view a vote in Stanford's name as representing more than the Trustees' view is reinforced by the representative way in which advice on proxy votes is conveyed to the Trustees.

Proxy Voting and the University

The voting of shareholder ballots as Stanford has done for the past five years, and the publicity releases that accompany each have a duty to establish policies and practices with respect to the vote, are intended to influence other institutions in society (in this case corporations) on issues unrelated to Stanford's basic purposes of teaching and research. The proxy process thus allows the university to be used for political purpose. This is wrong, even if the political purpose is a good one. Such actions are incon sistent with, and threatening to, the basic construct of the university as a neutral forum. People do not come together in a university for political pur poses, as the same individuals may do in other organizations. And the individuals within a university do not give to the Trustees or to the university officers a proxy to express their political or moral views. When the university takes an institutional political position, it abuses the relationship between the university and each of the individuals within it. It implicitly speaks on behalf of all members of the community, including those who don't share those views. Further, it removes from the university its cloak of nonpartisanship, and invites other institutions in society in turn to attempt to exercise influence over the university, and to seek changes in those aspects of university behavior thay have tolerated up until now.

Moral and political issues are not matters for institutional doctrine established in the Trustee board room, but rather the subjects for individual study and expression. Trustees must remove any obstacle to free debate, no matter how small, and certainly must avoid creating one. They must particularly protect those who, due to a lack of tenure or a firm base of support, may hesitate to express a view contrary to established university doctrine. An official Trustee position on extraneous, political and social matters may have a chilling effect on the very expression of views by faculty and students that the university is organized to protect. Such a risk, however small is unacceptable.

There is little similarity between the actions which may be taken by individual owners of securities, and those available to Trustees as owners of the university's stock. Individuals are free to purchase, sell or vote their shares arbitrarily, constrained only by the dictates of their personal beliefs and values. By contrast, University Trustees must not only act prudently, they must assure that their personal views give way to their overriding duty to preserve institutional neutrality.

An Alternative to Voting Proxies

Stanford, as an investor, must conduct itself in ways that are consistent with the moral standards it applies to the rest of its activities. Continued investment in an enterprise that flagrantly violates the law, or stubbornly ignores public policy, and thus causes substantial social injury, constitutes an implicit endorsement by the university of those policies. That is morally intolerable.

A stern test should be imposed for making such a judgment about the conduct of a corporation in which Stanford invests. Once that judgment is reached, Stanford's response should be chosen for its consistency with the internal standards of the university, and not for political reasons of influencing corporate behavior or taking public postures. If the standards and process of judgment have been rigorous, and the allegations against a corporation are sustained, divestiture will be the appropriate action in almost all cases.

In deciding how to respond to shareholder proposals, the focus of the CIR should be on the actions of the corporation, rather than the social importance of the issue to which they apply. The CIR should only evaluate charges that a company has willfully or knowingly, and directly, caused substantial social injury, and failed to take any action to eliminate or reduce it. Although such a rigorous standard might at first seem to preclude virtually any CIR activity, this is not the case.

The very fact that a charge appears as a stockholder resolution means that management is aware of the concern about its corporate activity, has discussed the issue with the SEC (and probably with the resolution's proponents as well), and has decided to oppose it. Management's opposition may arise from a disagreement about the accuracy of the charges, the nature of the proposed remedy, or both. But in any event, management cannot be unaware of either its own actions or the charges brought against them.

The addition criterion that the corporation's actions directly cause substantial social injury eliminates the speculative question of secondary effects. Prior CIRs have wrestled with this question, especially in cases in which beneficial products are put to a bad use. But any product can be used for good or evil, and therefore evaluation of substantial social injury cannot be based on the use to which a corporation's product may be put by a purchaser. Rather, it is the conduct of a corporation, related or unrelated to the use of its products, that should be the subject of the CIR's judgment.

A temporal sense of the criterion "directly" raises a more difficult prospect: the likelihood that a corporate practice will ultimately lead to substantial social injury although it has not yet done so. It is difficult to evaluate the potential risk of any social injury. It is virtually impossible to do so when all of the available data, and the experts who produce them, are themselves in disagreement. Still, we cannot ignore corporate behavior that the CIR believes will *inevitably* cause substantial social injury, and perceived inevitability would meet the tests proposed here.

All of these criteria should be applied to the *ongoing* behavior of a corporation. Even though some charges may be based on a single episode, such as a spill of toxic chemicals, a company should be evaluated by what it does to ameliorate the damage, and what changes it makes in policy and practice to avoid a repetition. Ongoing behavior cannot, by definition, be assessed at only one point in time (although a retrospective look may go a long way). Relieving future CIR from the time constraints of a quick decision (in order to vote a proxy by a corporation's annual meeting) will enable it to evaluate a company's behavior over a reasonable time and, if the charges against the corporation are sustained, then to take appropriate action without waiting for another year's cycle of proxy voting.

Stanford's presumption should be that the appropriate action will be divestiture. If a company is fully aware that its practices or policies cause, or will inevitably cause, substantial social injury, if it does not make changes to ameliorate or eliminate that injury, and if management has opposed shareholder proposals that would do so, then representations to management or non-binding votes by less than ten percent of the stockholders are not likely to be effective. In unusual circumstances, Stanford might wish to postpone divestiture until other means were tried to change corporate practice. If there were a lack of clarity about an actual corporate policy, if Stanford had data unknown to corporate management, if the corporate action in question were not an ongoing practice, or if it resulted from sudden changes in technology, regulation etc., Stanford might wish to make an additional effort at correction. But Stanford should not continue to profit from ownership of a company that causes substantial social injury while predictably ineffective means are attempted to change its recalcitrant corporate management.

Divestiture itself, if carefully carried out, will not violate fiduciary responsibility or harm the university. Five years ago, divestiture (or the threat of it) was seen as the ultimate shareholder weapon against corporate management. The sale of stock by a prominent institution, accompanied by widespread publicity, was expected to induce other investors to do likewise, and thus drive down the price of the stock. It was thought that in order to avoid this, corporate management would change corporate practice. As it turned out, in those instances in which universities did divest, even with publicity, there was no effect on either the price of the stock or the corporate practice in question.

Stanford should not use divestiture as a political tool intended to change corporate behavior, but rather as a means of eliminating an investment that no longer meets the university's standards of profitability, ethics etc. Stanford owns less than one-half of one percent of any corporation in which it has stock. The daily volume of trading is often more than Stanford's total investment, and gradual divestiture would therefore not affect the market price or the value of our portfolio. Stanford could replace the stock with that of a more responsible company in the same industrial group, and preserve the portfolio balance. And divestiture without publicity would not make Stanford legally liable for intentionally hurting a corporation, nor would it allow the university's investing practices to be used for partisan social purposes.

If all of the facts on which Stanford presently votes a proxy against management were known at the time a stock was considered for purchase, that purchase would not have been made. Confirmed charges of substantial social injury to which a corporation does not make adequate response are, in and of themselves, sufficient reason for the university not to own that stock.

*Rodney H. Adams also endorses Statement I

STATEMENT III

The essential purposes of Stanford University are teaching and research. Ancillary activities of the University are either necessary (practically, legally, and/or morally), or optional. For example, many of the administrative activities of the University are perceived as necessary to its functioning; compliance with applicable statutory and regulatory requirements of the Federal and State governments is legally necessary, and adherence to internal policies of non-discrimination, even when they go beyond legal requirements, is morally required, in the University's view, of any individual or institutional functioning in society. Optional activities, such as providing housing for faculty, maintaining a student union, holding a license to operate an educational FM radio station, and maintaining a department of police services, should be engaged in only when they contribute to and further the essential purposes of the University.

We believe that to a certain extent, the exercise of investment responsibility is morally required of us as it is of every investor, but that beyond that extent — that is, in the broader discretionary field —the University should refrain from taking positions because doing so does not further its essential purposes. Taking institutional positions on issues not directly related to our stated purposes of teaching and research may indeed impinge on our essential purposes, and in any event diverts energy and resources from them. Individual members of the university or voluntary associations of such members are free to take whatever position they wish on any issue.

The essential task of this year's CIR, as we understand it, has been to define as best we might the boundary between what is necessary and optional, and to suggest procedures that will efficiently separate out and focus attention on the former.

Affirmatively, the CIR should assist the Board of Trustees, as the body through which the University acts, to identify any

continued on next page

CIR/continued from page 17

among its investments that are so pernicious that it is manifestly immoral for the University to retain them. We note in passing that the legal obligations upon Trustees are in no way compromised by this policy: No just law can require individuals acting as trustee for any purpose, however favored, to participate in an obnoxious enterprise merely because the trust will benefit financially, and no law pur ports to do so — although obviously, if it becomes necessary to divest of some investment, this should be done in a way that will avoid, or minimize, harm to the University.

We support the Commission's recommendations because the proposed modifications to the existing guidelines add procedures appropriate to the task of discerning, studying, and making recommendations to the Board about, cases where the University owns securities in companies whose activities do significant, unredeemed injury, or create an unjustifiable risk of such injury. These cases will be rare. The securities identified should be those which no informed and concerned member of society would be willing to hold. Where the views of morally intelligent people may differ, taking a position is optional and the University should therefore refrain.

But though cases in which action is called for will be rare, it is important that the CIR continue in existence, to assure that when they occur, the University is aware of them. We view the screening of putative instances of substantial social injury as the Committee's primary function, and believe that the proposed procedure is well designed to select the few situations cal ling for fuller investigation that may lead to recommendations for action. As we envision it, the screening process will not be inordinately time-consuming or burdensome for the members of the Commission since only cases in which the allegations, if true, are morally intolerable need be passed for further con sideration.

While we support the continuation of the Commission on Investment Responsibility, we do so in the belief that the activity of the Commission will be limited to issues truly involving substantial social injury, which is the standard set forth in the existing Trustee guidelines for the Commission. The Commission should not be a forum for the consideration of popular political and social issues of the day.

Ellen Oppenheim*

* Ellen Oppenheim also endorses Statement I and provides the comment which appears following the signatures above.

History

The formation of the Trustees' Ad Hoc Committee on Investment Responsibility (including trustee, faculty, and students) and the adoption, on April 13, 1971, of a "Statement on Investment Responsibility" by that Committee, reflected the upsurge of social consciousness across the land. Students, consumer activists, and others sought to impress on nonprofit institutions, such as churches and universities, the social responsibilities stemming from their role as major corporate investors. Until then, Stanford and other universities had generally followed the traditional practice known as the "Wall Street Rule," which held that institutional investors should normally support management's position when questions concerning management's conduct of business were called to the attention of shareholders. The new activism reflected concern over the corporate contribution to a variety of social problems at home and abroad — from environmental pollution to racial discrimination in South Africa — and found expression, among other ways, in a wave of shareholder resolutions intended to draw attention to, and often to provide remedy for, such problems. The universities were challenged to respond to the new and growing practice of shareholder resolutions.

The 1971 Statement on Investment Responsibility reaffirmed the Trustees' legal "primary responsibility" to invest the University's endowment "so as to maximize the financial return on those resources." It went on to recognize that it was proper for the Trustees to give "independent consideration and weight to the possible social, economic and political implications of University investment policy" in certain specified classes of cases.

In the summer of 1977, a second Ad Hoc Committee on Investment Responsibility (consisting of trustees, faculty, students, alumni and staff) was given the task of re-examining the premises and procedures of the 1971 Statement. Its conclusion, contained in a report to the Board of Trustees dated November 11, 1977, was that the 1971 document, "however well motivated at the time of its drafting, was inadequate to the present situation." The Committee went on to note that "in the intervening seven years, the concepts of ethical investment and corporate social responsibility have become substantially accepted . . . The debate today is over the degree, rather than the propriety, of such considerations." The "present situation" and the "debate" referred to were, in fact, reflective of intense new concern on university campuses over the role of American corporations in South Africa. The Committee concluded that, due to inexperience, the 1971 Statement had been too tentative about affirming ethical investment responsibilities. It identified a finding of "substantial social injury" as the factor to which the University should give independent weight in its investment policies and in voting stockholder resolutions.

The Trustees adopted most of the Committee's recommendations in their "Statement on Investment Responsibility Concerning Endowment Securities," dated December 27, 1977 (Enclosure D), which remains operative to this day. While reaffirming their primary fiduciary responsibility, the Trustees recognized their role as "responsible and ethical investors" and provided guidelines for the practice of investment responsibility. The Statement called for the establishment of a new Commission on Investment Responsibility (CIR) that would make recommendations to the Trustees concerning the implementation of the new guidelines. The Board subsequently created a Special Committee on Investment Responsibility of Trustees (SCIR), to which the CIR has since been making its recommendations on proxy voting and other matters relating to investment responsibility.

The major operational effect of the 1977 Statement was to engage the revamped CIR in an ever-heavier examination of shareholder proxies. Pressure to make a recommendation on every shareholder resolution related to Stanford stockholdings — and do so knowledgeably and thoughtfully —mounted steadily as the number, scope and complexity of resolutions increased. The experience of the 1980 and 1981 proxy seasons led the outgoing Commission in June 1981 to the conclusion that careful thought should be given to the relative costs and benefits of proxy-voting by the University. It expressed its concern that perhaps the effort "simply isn't worth the time and the labor of the faculty, alumni, students, and staff involved in the process," stressing the seeming disparity between the effort expended and the apparent lack of tangible resuits in changing corporate behavior. Indeed, in 1980-81, even limiting its active consideration to proxy resolutions which were related to allegations of "substantial social injury," the CIR spent over fifty hours in meetings, each attended on the average by more than ten of its members; in addition members spent over 1,000 hours in preparation between meetings. Ninety-five percent of the shareholder resolutions demanding action had to be dealt with between the first of April and the middle of May.

The range of topics under consideration is illustrated by the following categories, taken from this year's listing of proxy resolutions by the Investor Responsibility Research Center (IRRC): nuclear weapons production; infant formula code; investment in South Africa; energy conservation; drug sales abroad; investment in Chile; no trade with communist countries; genetic engineering; nuclear plant conversion; foreign military sales; compliance with Sullivan Principles; pesticide exports; no investment in Namibia; disposal of radioactive wastes.

It was this sense of pressure and complexity that led the CIR of 1980-81 to recommend that the Trustees modify the charter of the CIR to permit a one-year moratorium on its normal consderation of shareholder resolutions, and to have it undertake **instead a "comprehensive review...of the goals, procedures, and mechanisms for ethical investment by the university."**

The Commission's Work

The 1981-82 Commission on Investment Responsibility held sixteen meetings. It reviewed the literature on the subject, including the influential primer, *The Ehical Investor,* by John G. Simon, Charles W. Powers, and Jon P. Gunnemann (Yale University Press, 1972), as well as the major studies and policy documents produced on other university campuses in the 1970s. Members of the Commission contacted counterparts at other academic institutions and foundations to survey current practices and policies. The Investor Responsibility Research Center, as the major single source of research and information on shareholder proposals, was consulted in some detail, as were a number of individuals, both in universities and in industry, who are knowledgeable about or concerned with problems of investment responsibility.

The CIR held an extraordinary meeting at which six former CIR chairs, members and university officials presented their diverse views — a meeting which the current members found valuable indeed and which, in retrospect, foreshadowed the fundamental division of opinion among this CIR's membership. Finally, the Commission placed repeated advertisements in three campus publications soliciting opinions, expressions of concern or questions regarding ethical investment from members of the university community. It received no responses.

STARTS shows films by great directors

Student Arts at Stanford (STARTS) and the Graduate Student Association continue this fall to provide the community with high quality films of both artistic and historical interest through the Great Directors Film Series. The series runs through Dec. 10 and features the films of Carl Dreyer, Jacques Rivette, Jean Marie Straub, and Marguerite Duras.

The films will be screened at 8 p.m. every Friday in Room 320, Geology Corner. Admission is $2.75 for students and $3.75 for the general public. Following the Oct. 15, 29, and Nov. 12 showings, there will be a reception sponsored by the Graduate Student Association. Refreshments will be served.

The schedule is:

Oct. 15: *Day of Wrath* and *Vampyr* (Carl Dreyer).

Oct. 22: *Paris Belongs to Us* (Jacques Rivette).

Oct. 27: *The Nun* (Rivette).

Nov. 5: *L'Amour Fou* (Foolish Love) (Rivette).

Nov. 12: *Chronicle of Anna Magdelena Bach* (Jean Marie Straub).

Nov. 19: *Moses and Aaron* (Straub).

Nov. 26: *History Lessons*: *Not Reconciled* (Straub).

Dec. 3: *Destroy, She Said* (Marguerite Duras).

Dec. 10: *India Song* (Duras).

Seven classes to reune at USC game

Seven Stanford classes will hold reunions this weekend in connection with the Stanford-USC football game. The program will include lectures by a number of faculty members, tours of the campus, and a variety of social events.

The classes participating in the festivities are '42, '52, '57, '62, '67, '72, and '77.

On Friday morning all classes will have the opportunity to attend the "Rediscovering Stanford" program with lectures by Clayborne Carson, history; Dr. Richard Coleman, Sleep Disorders Clinic; Robert Horn, political science; and Jerry Talley, sociology. President Donald Kennedy will speak at a noon luncheon at Bowman Alumni House.

The Class of '57 will have two separate luncheons: an athletic/admissions luncheon at Sharon Heights Golf and Country Club and a ladies' lunch at the Meyer-Buck estate.

The Class of '42 will have a lunch at the Menlo Country Club, followed by golf and tennis, and the Class of '62 will gather for no-host hamburgers at the Alpine Beer Garden.

At 2 p.m. there will be tours of the Medical Center, the Linear Accelerator Center, the Stanford Museum, and the historical area.

The Friday evening program for the various classes:

Class of '42: Wine reception beginning at 5:30 at *Sunset* magazine.

Class of '52: Cocktails and dinner at Hyatt Rickeys, Palo Alto Room, beginning at 7 p.m.

Class of '57: Dinner/Dance at Palo Alto Hills Golf and Country Club, with a special social hour for singles beginning at 6 p.m.

Class of '62: Cocktails and dinner at the Golden Spike Restaurant in the Stanford Barn, beginning at 6:30 p.m.

Class of '67: Cocktails and buffet at the Menlo Circus Club, beginning at 6:30 p.m.

Class of '72: Cocktails and buffet at the Holiday Inn, Palo Alto, beginning at 7 p.m.

Reunion class members will hold pregame tailgate parties beginning at 10:30 a.m. on Saturday. All will be held on Angell Field except '57, which will gather in the Sunken Diamond.

Following the game, '57 will reassemble at the Holiday Inn; '62 at its tailgate site on Angell Field, and '72 at Alpine Beer Garden. The Class of '42 will hold a dinner-dance at the Menlo Circus Club beginning at 7 p.m.

Venture capitalists regarded as new kind of hero—Brandt

A practicing entrepreneur, who teaches entrepreneuring and has now written a book on the subject, says entrepreneuring is now having a rebirth in the United States and a new type of entrepreneur is emerging.

That is the belief of Steven C. Brandt, senior lecturer in management at Stanford University's Graduate School of Business, author of *Entrepreneuring: The Ten Commandments for Building a Growth Company* (Addison-Wesley publishing Co. Inc., 190 pages, $12.95 cloth).

"Venture capitalists are suddenly national heroes, capital gains are respectable, even patriotic," says Brandt. "Terms like innovation, technology, productivity, and startup are already a part of everyday conversation and the political world is finding out that the real source of new jobs is new businesses."

In the entrepreneurial revival, the "Lone Ranger" entrepreneur of yesteryear who started a business, built it up and then sold out when it got too big, its giving way to the "professional entrepreneur" who, with a broader base of management skills, stays with the company, adjusting as the firm becomes larger and more complex.

What makes the difference between the traditional and the new is that the new entrepreneur is "able to put sufficient distance between the company and himself to see what has to be done to take the firm past its infancy." That ability to put sufficient distance between the entrepreneur and the company is the ninth of Brandt's ten commandments for building a growth company.

Classic stereotype

In the classic stereotype, the entrepreneur is pictured as an intuitive, hard-driving, fix everything, "sweet equity" firgure, he says. "A lot of people like that got rich, but staying rich often meant having to sell out and start over again."

The professional entrepreneur arrived on the scene in the 1960s at about the same time that management came into its own as a separate, distinct discipline. The rise of the professional manager coincides with the national boom in interest in MBA training, although Brandt points out that "one is not a corollary of the other."

Having an MBA degree is desirable but not necessary for professional entrepreneurs, in his view. "If a person doesn't have an MBA, he or she, in any case, understands the kinds of things that are taught in MBA programs. It is not necessary that people have knowledge in all areas of business but they know how to get that knowledge."

Relying on teamwork to get the knowledge you need is particularly important in building a high-growth company, he adds. "I've wrestled with that problem myself," says Brandt, who this year started Cdex, a Los Altos-based producer of computer-based training materials.

New entrepreneur

Brandt's new entrepreneur is a far cry from the "boom or bust" individual of legend. "The new breed tend to be calculated in their approach to risk," he says. "They are not apt to walk tightropes. They take reasonable risks and if they lose, they haven't bet everything on it."

Growing awareness that the growth of new business means the growth of new jobs has legitimized entrepreneuring, Brandt believes. "The new-breed entrepreneur is seen as doing something for society, not just running around making a fast buck and driving a Rolls Royce."

The increasing numbers of business school graduates wanting to join small companies is an indicator of the legitimizing of entrepreneuring, in Brandt's judgment. Approximately one-fourth of Stanford's MBA class of 1982 conducted its own search for jobs in small business through a variety of marketing techniques including student-hosted meetings for area entrepreneurs and development of a special book of student resumes. Twenty-three percent of the class of 1981 joined firms with fewer than 100 employees and, despite the shrinkage in job offers from smaller firms this past year, 16 percent of the class of 1982 took jobs with firms of this size. This compares with nine percent of the class of 1978 who joined such firms.

Professional entrepreneur succeeds the Lone Ranger, who built and sold firms.

Steven Brandt

"These MBA students are, after all, stable, conventional people by and large," says Brandt. "When they make the decision to come back to school and spend a great deal of money getting an education, they are not likely to do something too far out."

Brandt sees turbulent times ahead between now and the year 2000, but adds that "change favors entrepreneuring." To be successful in the 1980s and 1990s, entrepreneurs must be in harmony with inflation, population dynamics, communications technology, major political and social trends, computers in the home, economic gyrations, floating exchange rates, and "a world in which each country aggressively rubs elbows with most others."

Drawing on the thinking of futurist Alvin Toffler, Brandt talks of a "third wave" of human progress, one focused on expanded opportunities for individualism. Unlike the first and second waves—the agricultural and industrial revolutions, which he calls collective movements—the third wave is a dispersing or decentralizing movement toward individualism.

"With the microcomputer and closed circuit television, you have people being able to order what they want from their living rooms. Look at the growth of specialized magazines. There is now a publication for virtually any group you can think of. You can also see this in the energy area, where as we move from dependence on fossil fuels to solar supremacy, virtually everyone can obtain the energy he wants and needs on his own.

"This is all giving tremendous leverage to the individual, and there is good and bad, blessing and threat, in all of it. For some, this is going to be very scary because it is an intensification of choice or freedom, and may be more freedom than people want or feel they can handle. At the same time, it is a potential gold mine for the entrepreneur, who finds opportunity in the midst of such change."

—Herb Blanchett

Extension could cure bottleneck...

continued from page 1

He also cited the increased amount of construction traffic that will be generated during the next several years as the Stanford West housing project, the Hospital Modernization Program, and the Neiman-Marcus store addition to the Shopping Center are implemented. The only truck routes to those sites are from Willow Road on the south and Palm Drive, Galvez, and Arboretum on the north.

"Finally, the land now being used by through traffic in the Shopping Center can be converted into badly needed parking," Massy said.

Stanford has proposed a 423-car parking deck at the Center to help meet the need for 700 spaces as the Neiman-Marcus store is built.

Massy said the Trustees would take action on the proposal at their December meeting after hearing a report from the University staff.

"I would like to emphasize as strongly as I can that we are interested only in a connection with El Camino Real. We have no interest whatsoever in crossing the highway, and we stand ready to do whatever we can to help prevent such an action."

Willow Road has been called "the worst traffic bottleneck in the area" by the Palo Alto city staff. An extension has been a controversial subject for decades, mainly because it lies along a route once proposed for an expressway across the Peninsula.

Menlo Park voters rejected the expressway in 1971, and the state has dropped the route from its plans and has sold the right of way it had acquired.

Menlo Park and Palo Alto later approved the concept of an extension to El Camino Real on four occasions, but the Palo Alto Council fell one vote short of approving an assessment district in 1978 after three Council members abstained from voting.

Palo Alto approval is needed to build the road, and to connect it with Willow Road and Arboretum, both city streets. Approval will also be required from the State Division of Highways for a tie with El Camino Real.

The Palo Alto Planning Commission will begin its review of the Stanford West E.I.R. Wednesday night, Oct. 13.

Visiting scholars room at Green

Scholars visiting Stanford who need to use the collections in Green Library now have access to the Visiting Scholars Room.

Furnished with tables, chairs and shelving, the room is intended to provide space for uninterrupted research and writing requiring the use of adjacent library collections. Space will be assigned for one to 12 months, depending on the scholar's need and the pressure of requests.

Just as the Stanford faculty uses libraries world-wide during research leaves, so other scholars find Stanford's research collections of value to their work.

Faculty members from institutions outside the Bay Area who are conducting research at Stanford will receive preference in assignment, although other nonstudent scholars will also be considered.

The monthly fee for use of the room and eligibility requirements are outlined in the "Policy for the Assignment and Use of the Visiting Scholar's Room in the Cecil H. Green Library," available from the Privileges Division, Green Library.

STOPS to start at Tresidder soon

STOPS (Stanford-Tresidder Outdoor Programs, an organization which aims to help people make their outdoor adventure fantasies come true) will hold an organizational meeting at 7 p.m. Thursday, Oct. 21, in Room 270 of Tresidder Union.

STOPS offers a variety of resources and some wild and woolly adventures—and a chance to plan new and exciting trips with other members.

For more information, call the Tresidder Recreation Center, 497-4311.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

28540-AW (JCC:5042) PROGRAMMER SYSTEMS II: Respon for the maintenance of operating sys on Integrated Circuits Labs computer sys; sys incl 3 Hewlett-Packard 1000 series CPUs running the MAGUS-IV operating sys, a Hewlett-Packard 3000 Series III computer running an MPE-III operating sys, & a DEC VAX-780 computer running UNIX; determining sys software needs & either developing or acquiring the nec software; keeping current sys & users manuals & documentation; instructing new users in use of various sys; supv part-time & student help; QUALIFICATIONS: ability to program in Hewlett-Packard Assembly Lang, FORTRAN, RATFOR, BASIC, PASCAL & C; familiarity w/ HP 1000 & 3000 series computers & w/ DEC VAX-780 computers; exp in use of MPE-III, RTE-IVB Magus-IV, & UNIX; exp in writing I/0 drivers & w/ distributed sys helpful.; C06; $1854-2312.

27173-TC (JCC:5588) LIFE SCI RES ASST I: Work in a cardiovascular res lab in div of Cardiology; projs incl animal surgery, instrumentation w/ physiologic recording devices, & animal care; involve both basic physiology experiments & drug research; other projs will incl in vitro work exploring mechanisms of drug/receptor binding; collect data & perform extensive analysis; QUALIFICATIONS: baccalaureate degree or equiv exp in cardiac res; exp w/ handling large & small lab animals; exp w/ animal anesthesia, surgery, & post-op care; exp w/ regular binding experiments, basic pharmacology methodology; exp w/ electronics/drug assay, analytical equip't desirable.; C05; $1670-2086.

27141-TC (JCC:5588) LIFE SCI RES ASST I: Work w/ principal investigator in field of toxicity of anesthetic agents; collection, preparation & analysis of animal tissue & fluids using equip't for gel chromatography, thin layer chromatography, gas chromatography, subcellular membrane fractionation, density gradient ultracentrifugation, liquid chromatography & radiolabeled ligand binding studies; record-keeping; analysis of data, troubleshooting & the ability to recognize unusual reactions & determine source of problem; sole respon will be organization of lab schedule & performance of tech procedures; QUALIFICATIONS: have lab exp; bkground in biochemistry as well as tech skills relating to animal health care & surgery for an anesthesia res lab; BS degree or equiv edu & exp mandatory; 12 mos lab work exp during or after college.; C05; $1670-2086.

27284-JB (JCC:1472) Stu Serv Offcr II: Principal responsibilities of Assistant Dean are recruitment, graduate student programs and general admin; recruiting Chicano applicants to Stanford's Graduate Programs, includ extensive recruiting trips, establishment of natl network of Chicano faculty administrator contacts, follow-thru w/potential applicants, assisting depts w/dvlpmt of recruitmt strategies, prep of recruiting matls; convey concerns & needs of Chicano grad students to Dean & his staff; prov advice & informa about Univ svcs; offer counsel about academic & professional matters to grad students incl financial aid; participate in planning, dvlpt, coord, & evaluation of Affirmative Action Program, etc; QUALIFICATIONS: understanding of grad & prof edu in major res univs & issues relating to edu of Chicanos; advanced degree reqd; admin exp in post-secondary edu highly desir; effective commu, oral & written; initiative human sensitivity orgn'l ability, & ability to understand & work w/others; C06; $1854-2312

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, Oct. 19, in room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Hospital

Submit applications to the Hospital Personnel Department, 770 Welch Road, or call 497-6361.

MANAGEMENT ENGINEER—Management Systems—#5046—(G-178): Responsibilities: Responsible for conducting various projects which are requested of the Department. Theses projects involve application of management engineering techniques to achieve improved management systems and/or cost reduction. Under the direction of the Director of Management Systems, the Management Engineer will work independently in planning and conducting projects as well as implementing study results; Qualifications: BSIE or equivalent required. MSIE, MBA or equivalent preferred. Minimum of 3 years experience required (at least 2 in a health care setting). Permanent, Fulltime, M-F, $11.32-$14.71 hourly.

Nonexempt

26974-PM (JCC:2470) OFFC ASST IV: To aid administrator of Sleep Disorders Ctr: receive and screen calls and visitors for supvr; alert supvr to personnel and staffing problems; field staff requests and problems; maintain Sleep Ctr files; process orders for Clinic and Ctr; interact w/ Univ and Hospital depts as nec to expedite reqs; asst in prep of grant proposals and all fundraising efforts; asst in cost analysis and planning space utilization in 4 separate facilities, etc; QUALIFICATIONS: typ 60; able to understand and facilitate the purposes and long-range goals of Ctr; excel judgment; strong organizational skills; ability to adjust in the face of continually changing prior; good interpersonal skills; contact: Lynn Hassler, TD114, 497-6601; B14; $1440-$1514.

26973-PM (JCC:2630) SPECIALIST TYPIST: 75%; fixed term 10/25/82-4/23/83; 8:30-3:30; typist/word processor to Sleep Disorders Ctr; typing of corresp, scientific manuscripts, and grant proposals on Apple Pascal and typewriter; edit draft for style, format, bibliographic accuracy and completeness; respon for proofreading for accuracy and grammatical correctness; xeroxing; filing; mailings; order supplies, etc; QUALIFICATIONS: typ 60 accurately; word processing exp preferred; able to interact w/ a variety of personalities; ability to follow instructions and give careful atten to detail; contact: Pam Tondreau/Lynn Hassler, TD114, 497-6601; B12; $982.50-$1,029.75.

Carpools

Looking for carpool, Fremont to Stanford, approx. 7 a.m. to 5:30 p.m. Call Steve at 7-9583 or 792-1486.

Established carpool, Oakland to Stanford, Hours 9-6. Non-smokers. George Gianopoulos, 7-6856.

Carpool/rider, nonsmoker. SF to Stanford. 9-5, M-W, F. Call Paul Turner, 497-4275 or 497-3404, or David, 497-2727.

Looking for a ride or shared driving from Santa Cruz, 8-5. Gordon Muir, 497-3380.

Need rider from Los Gatos/Saratoga area arriving at Stanford 7:30 a.m., leaving 4:30 p.m. Call Gloria, 497-4970.

Want to join or form carpool from Sunset Dist., S.F. (near 19th Ave.) to Stanford, T-F, 9-5 or 6. Robert, 753-3860 or ext. 7-4116.

Nonexempt

30968-PM (JCC:1747) LIBRARY SPEC I: 50%; 8-12; performs duties in Catalog Dept; filing in Main Catalog of approx 5000 trays; editorial work for validating access points; performs authority work for heading changes in SUL catalogs; files in Shelf Lists; files in Spec Collections & Reference Room catalogs; QUALIFICATIONS: typ 40; demonstrated clerical & organizational skills; ability to learn filing rules & file structures of a large, complex catalog sys required; prev exp in cataloging desirable; some bkground in foreign langs, preferably Western-European; able to stand for long periods of time & lift heavy catalog trays; contact Bob Johnson, Green Lib, Rm 223 (497-3152); B10; $595-623.

30885-PM (JCC:1747) LIBRARY SPEC I: Mon, Tues, Fri, 9-6; Sat, 9-5; Sun, 10-6; check ID's; charge & discharge books & maintain stack areas; issue ID's; process reserv mat'ls; search for missing books; prov informa & dir'l help to lib users; work at a very busy Circulation Desk; update mat'ls; answer phones; page books; open Lib on wkends, etc; QUALIFICATIONS: ability to handle several patrons/tasks simultaneously; be flexible enough to change work schedule temporarily during intersessions, holidays, & emergencies; interpret & carry out lib policies; accomplish procedures involving extreme detail; send appl/resume to Heidi Quitman, Room 250E, Law Library.; B10; $1189-1246.

31932-BP (JCC:2210) ACCOUNTING ASST III: Accurately, efficiently & independently prepare for recording & acknowlmt all gifts & pledges made to Univ; prov assistance in, & assume respon for, the coverage of any desk w/in the dept, as dictated by workload and/or available personnel; prep, reconcile & maintain various logs, records & reports; prep agenda & minutes for dept mtgs; share in assumption of supervisory respon in supvr's absence; QUALIFICATIONS: typ 35-45; strong acctg aptitude or bkground; familiarity w/ SU acctg procedures extremely helpful; supvry skills; good written & verbal commu skills; legible handwriting; detail oriented; exp in working w/ large volumes, constant pressure & frequent deadlines & interruptions; able to use 10 key adding machine; send appl/resume to Liz Trujillo, 301 Encina Hall.; B14; $1440-1514.

30616-BP (JCC:2454) OFFICE ASST II: 50%; prov bkup support on phones & genl offc duties; require at least 2 hrs a day of simple data entry at CIT connected terminal; will train; position may expand to full-time in the future; QUALIFICATIONS: accuracy important; knowl of typewriter or computer terminal keyboard, offc machines, & standard offc procedures; send appl/resume to Alain Decleve, Encina Annex.; B09; $565-595.

29438-PM (JCC:2454) OFFICE ASST II: Fixed term 11/15/82-8/15/83; assembly of application mat'l for MBA Program into file folder; work w/ confidential mat'ls daily; verifying requested mat'ls to be accurate, authentic & complete in folder; retrieving GMAT scores; completing data processing form; calculating GPA's; notifying applicants of missing credentials or completeness of folder; help to answer 4-line phone sys; prov assistances for other desks in 5-person offc as work load demands; QUALIFICATION: typ 40; accuracy & atten to detail essential; good math skills & ability to use calculator; command of oral & written English essential; knowl of Stanford & college admissions helpful; send appl/resume to Cecilia Strickland, GSB or call 497-2766.; B09; $1130-1189.

29437-PM (JCC:2454) OFFICE ASST II: Fixed term 11/15/82-8/15/83; assembly of application mat'l for MBA Program into file folder; work w/ confidential mat'ls daily; verifying requested mat'ls to be accurate, authentic & complete in folder; retrieving GMAT scores; completing data processing form; calculating GPA's; notifying applicants of missing credentials or completeness of folder; help to answer 4-line phone sys; prov assistances for other desks in 5-person offc as work load demands; QUALIFICATION: typ 40; accuracy & atten to detail essential; good math skills & ability to use calculator; command of oral & written English essential; knowl of Stanford & college admissions helpful; send appl/resume to Cecilia Strickland, GSB or call 497-2766.; B09; $1130-1189.

30608-BP (JCC:2462) OFFICE ASST III: 50%, 8-12; fixed term for 6 mos; will be trained to operate WANG word processing equip't; produce accurate finished form typing of geni corresp, reports, proposals & forms fr typed, dictaphone or longhand drafted mat'l; proofread for accuracy & edit for correct spelling & punctuation; QUALIFICATIONS: typ 50+; knowl of transcription & word processing equip't helpful & willingness to learn essential; ability to set prior & meet deadlines; willingness to work occasional overtime; ability to proofread & edit your own typed mat'l for approp spelling, syntax, grammar & vocabulary are important; send appl/resume to Katriena Youmans, Old Pavilion, Personnel, Stanford University.; B11; $623-655.

29957-BP (JCC:2462) OFFICE ASST III: 50%; supv 10 dept shop acct budgets; asst w/ maintenance of dept budgets; process mat'ls used to reconcile budgets; maintain key sys records & distribute keys; prep reqs & other Univ forms; misc typing, filing, photocopying; answer phones; act as intermediary between dept & students & between dept & greater Univ community; QUALIFICATIONS: typ 65; deal well & efficiently w/ people; pay great atten to detail; flexible in working arrangements; send appl/resume to Sally Tremaine, Chemistry Dept, Mudd 121A.; B11; $623-655.

27086-PM (JCC:2554) SECRETARY II: Fixed term for 1 yr; full range of sec'l support for Sr. Fellow working on economics of public finance (50%) & to Sr. Research Fellows & Scholars (50%); typ corresp, articles, & manuscripts in draft & final form, primarily on word processor & often fr taped dictations; travel arrangements & calendar; phones & mail; setting up & maintaining files; expense reports & other univ forms as required; QUALIFICATIONS: typ 60; excel typing skills; high-level ability to use word processing equip't & heavy transcription (for taped dictation); send appl/resume to Dr. Charles E. McLure, Jr., Hoover Institution, Stanford, CA 94305; please do not telephone.; B11; $1246-1310.

28212-PM (JCC:2596) SECY II-SPEC: Sec/Offc Asst for Stanford Arthritis Ctr & assoc'd projs; sec'l support for health professional, as well as support for a four person offc; involve daily interaction w/ Data Bank Network Sec in order to ensure smooth offc function; typ corresp, proposals, manuscripts, reports, Univ forms, etc. fr handwritten copy; answer phones & greet visitors; run errands; maintain files; schedule arthritis self-mgmt classes; computer enter & verify arthritis edu proj data; QUALIFICATIONS: typ 65+; some familiarity w/ med terminology & text editing, using Wylbur, preferable; 2-3 yrs prev offc exp or equiv; good English grammar, spelling, punctuation; good commu skills; non-smoking offc; send appl/resume to Kay Metteauer, 701 Welch Road, Suite 3301.; B12; $1310-1373.

29463-PM (JCC:2596) SECY II-SPEC: Sec to several full-time faculty members in different GSB teaching areas; typing of course mat'ls, drafts, manuscripts, genl corresp; transcribing of tapes; making travel arrangements; setting up mtgs; keeping calendars, & other routine sec'l duties; high percentage of the required typing is tech (equation, use of mathematical & Greek symbols); QUALIFICATIONS: typ 60-70; good sec'l working exp, some of it in edu'l environ preferred; good typing skills, spelling & grammar essential; exp w/ MUSE 1 W.P., or willing to learn; heavy tech typing load; send appl/resume to Katherine Bostick, Rm 248-K, GSB, or call 497-2187.; B12; $1310-1373.

31719-PM (JCC:2672) MED SERV ASST III: Fixed term 10/16/82-4/30/83; 7:45-4:30; respon for identification of remittances to patients accts; involves batching remittance, balancing batches, entering batches on a CRT & correcting errors; also respon for the entry of adjustment & insurance request forms; daily logging of clinic batches & distribution of error listing to clinics; QUALIFICATIONS: clerical & terminal work exp; basic acctg training of or exp; contact: Patti Barber, 525 University Ave. Suite 400.; B11; $1246-1310.

31720-PM (JCC:2672) MED SERV ASST III: 7:45-4:30; respon for researching remittances to patients accts; involves researching requests submitted fr other FPP billing areas; filing cash batches in strict order; prep medicare EOB's for filing; book monthly claims & wkly reports; QUALIFICATIONS: basic acctg & clerical training or exp; requires accuracy & flexibility for the variety of duties; send appl/resume to Patti Barber, 525 University Ave., Suite 400.; B11; $1246-1310.

20098-JB (JCC:6810) SOC SCI RES ASST I: Planning experiments under the direction of the Prof.; typ stimuli for questionnaires; run experiments; schedule subjs, record data, debrief subjs; perform standard statistical tests by calculator & computer using some original programs; prep tables & graphs; lib res, etc; QUALIFICATIONS: knowl of statistic & statistical programs; familiarity w/ computer ctr facilities; ability to use calculator; knowl of PASCAL, FORTRAN, or 'C' computer lang; bkground in Psychology desired w/ some familiarity w/ Psycholinguistics.; B12; $1310-1373.

Bargaining unit

30967-PB (JCC:1728) PORTAL MONITOR: TMS Unit; 50%; Sun-Thurs, 7-11:15pm; performs duties in Central Circulation Dept at the entrance portal; checks patrons' identification for access to lib; enforces lib regulations w/ regard to pets, smoking, food & beverages; prevents access by potentially disruptive persons & refers security problems to supvr on duty; examines book bags, briefcases & other belongings for lib mat'ls at the exit portal; maintains statistics; shelving & sorting discharge cards as needed; QUALIFICATIONS: prev public serv exp; ability to commu clearly in spoken English; ability to learn & apply lib regulations tactfully & courteously; dependability & punctuality.; A09; $5.68.

33119-PB (JCC:5644) LIFE SCI TECH II: TMS Unit; biological lab tech for small animal pharmacology/-physiology lab; study tolerance & physical dependence to various psychotropic drugs; weigh, feed, water lab animals, & adminster drugs by various routes; keep detailed records on each animal; collect blood & tissue samples & assay them for drugs in question, using assays developed by more exp'd personnel; operate & maintain a high pressure liquid chromatograph; do treadmill tests, rotarod test, use of activity meters, & detailed observation of behavioral responses in rats & mice; QUALIFICATIONS: ability to handle lab animals, particularly rats & mice; knowl of various lab equip't; elementary knowl of computer programming & statistics, preferably BASIC, in order to perform analysis of data.; A24; $8.08.

29752-JB (JCC:7654) CUSTODIAN: TMS Unit; 7:30-4pm; daily cleaning, mopping, waxing, vacuuming, cleaning restrooms, etc; washes walls & woodwork by hand or using industrial equip't; spot clean, shampoos, waxes, dusts & oils furniture; QUALIFICATIONS: knowl of cleaning & waxing methods & mat'ls used in light cleaning; knowl of related safety procedures.; A13; $6.24.

Contracts and grants

Following is a selected list of government and nongovernment contracts and grants of $200,000 and over, received for the month of September:

FEDERAL

New Contracts

Robert H. Cannon, Thomas O. Binford, James D. Meindl, aeronautics and astronautics, "Center of Excellence in Aerospace Automation," $3,100,000 from the Department of the Air Force for 3 years.

George Herrmann and David M. Barnett, mechanical engineering, "Energy Changes in Transforming Solids," $665,000 from the Department of Energy for 4 years.

Martin Morf and John T. Gill, Stanford Electronics Laboratory, "Algorithms for Locating and Identifying Multiple Sources and Receivers by a Distributed Sensor Network," $916,392 from the Defense Advanced Research Projects Agency for 2 years.

Richard M. Swanson, Stanford Electronic Laboratory, "Investigation of Metallic Impurities Introduced into Silicon," $308,199 from the Defense Advanced Research Projects Agency for 2 years.

Contracts—Amendments

Jack D. Barchas and Patricia R. Barchas, psychiatry, "Neuroregulators and Stress: Studies of Peptide and Catecholamine Responses to Stress," $395,000 from the Department of the Navy for 1 year.

New Grants

Craig T. Bowman and Ronald K. Hanson, "Gas Phase Reaction Kinetics of NOx Formation from Fuel Nitrogen in Fossil Fuel Combustion," $203,437 from the Environmental Protection Agency for 2 years.

Stanley S. Hanna, physics, "Research in Nuclear Science," $260,000 from NSF for 1 year.

Grants—Amendments

Paul Berg, biochemistry, "Mechanisms and Regulation of Gene Expression," $333,815 from NIH for 1 year.

J. Martin Brown, radiology, "Combined Modalities: Cell, Tumor and Tissue Effects," $280,058 from NIH for 1 year.

Luigi L. Cavalli-Sforza, genetics, "Human Population Genetics," $281,669 from NIH for 1 year.

Robert F. DeBusk, Department of Medicine, "Objective Evaluation Early After Myocardial Infarction and Heart Surgery," $331,597 from NIH for 1 year.

Edward A. Feigenbaum and Edward H. Shortliffe, Department of Medicine, "Stanford University Medical Experimental Computer Resource (SUMEX)," $1,629,190 from NIH for 1 year.

Rex L. Jamison, Department of Medicine, "Micropuncture Studies of the Mammalian Renal Medulla," $206,645 from NIH for 1 year.

Henry S. Kaplan, radiology, "Radiobiology-Oncology Research Program," $891,301 from NIH for 1 year.

Arthur Kornberg, biochemistry, "Mechanism and Control of DNA Replication," $374,585 from NIH for 1 year.

I. Robert Lehman, biochemistry, "DNA Replication in Pro-and Eukaryotes," $256,607 from NIH for 1 year.

Seymour Levine, psychiatry, "Developmental and Behavioral Neuroendocrinology," $279,217 from NIH for 1 year.

James D. Meindl, Stanford Electronics Laboratories, "BME Center for Integrated Electronics in Medicine," $983,580 from NIH for 1 year.

Lyle M. Nelson, communication, "Fellowships in the Humanities for Professional Journalists," $264,313 from the National Endowment for the Humanities for 1 year.

John D. Wirth, Center for Research in International Studies, "Joint Stanford-Berkeley National Resource Center and Fellowships in Latin American Studies," $228,325 from the Department of Education for 1 year.

NON-FEDERAL

New Contracts

Donald C. Harrison, Department of Medicine, "Long-Term Encainide Therapy for Patients with Cardiac Arrythmias," $207,360 from Bristol-Myers Pharmaceutical Research and Development Division for 2 years.

New Grants

Donald Kennedy and J. Myron Atkin, School of Education, "Study of Stanford and the Schools," $200,000 from the Lilly Endowment for 2 years.

Rental housing

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

HOUSING NEEDED

□ **Jan. & Feb. '83:** Single woman would like to hsesit for these 2 mo. Call 854-2658.

□ **Jan. to Mar. '83:** Visit Prof & wife seek 1 or 2 BR furn apt for hse within 1 mi. of campus. Homeowners, nonsmokers, local refs. Call (212) 260-8221, or write: R. Lipsey, 70 E. 10th St, #3A, NYC, 10003.

□ **Jan. to Mar. '83:** Retired cpl seeks furn. 1 or 2 BR apt., condo, or hse. on campus., Palo Alto, Menlo Pk. Close to shops, campus. Pkge deal to incl. car best. Call Dave Marimont, 497-3796 (day), 325-7182 (eve).

□ **Nov. & Dec. '82:** Faculty visitor seeks hsesit or pay modest rent. Dates flex; Will care for pets. Call 327-8160 after 7 pm.

□ **NOW:** Female grad. stud. seeks rm w/lite kitchen priv. for fall qtr., nonsmoker, neat. Finishing MA in Art Hist. $200 to $300/mo. Call Suzanne (415) 365-6274.

□ **Feb. 15 to July 1, '83:** Swedish Post-doc Fellow seeks furn. hse in Stanf. or Berkeley area. EXCHANGE hse in Lund, Sweden as of Jan. 15. Call (415) 851-2345 or write: Dr. Erik Wallin, Sparnogaton 14, 222, 52, Lund, Sweden.

□ **XMAS SEASON:** HSESIT. Fac. mbr Pa. prep sch. seeks hsesit opportunity Stanf. area during holiday break. Call Phil (415) 965-5404 (day) (415) 369-6130 (eve).

□ **Jan. to June '83:** Visit Prof & wife from Oxford, no children, seek 2 or 3 BR furn hse or apt. on or nr. campus. Call (415) 857-9263.

□ **HOUSESITTING:** Established prof. cpl. seeks long term hsesit position. Nonsmokers, no pets, no children, neat, quiet, local ref. avail. Call 326-6425, 328-5344.

□ **Dec. '82 to Mar. '83:** Want to rent 2BR or more, furn. condo or hse. Call collect (714) 752-7870.

□ **Jan. to July '83:** Johns Hopkins Prof., visiting SLAC, seeks hsng. for self, wife & 12-yr-old child. 2 or more BR hse or condo nr campus & schls. Will EXCHANGE spac. 5BR hse in Roland Pk., Baltimore, walk dist. excl. priv. schls. Call collect (310) 366-1892 or Gwen Bowen, SLAC, (415) 854-3300, ext. 3111.

□ **Jan. to June '83:** Visit. Fac. Grad. Sch. of Bus., wife, son, and obedience trained standard poodle seek hse or apt, 3BR, in Palo Alto Sch. Dist. Call collect (203) 387-4010.

□ **NOW:** Resp. prof. cpl. seek rental hse, 1 yr. lease. No children. Palo Alto, West Menlo, Mt. View. Call between 6 & 9 pm, (415) 349-9794.

□ **NOW thru end of Jan. '83:** Chief exec. officer of loc. corp. seeks 4-5BR furn. hse. immediately. Call J. Lange. Stanf. Alum. Assoc. 497-2021 or 321-4961.

□ **Winter Qtr:** Short term rental for parents of Stanf. prof. Any time during qtr.—Jan.-Mar. Nonsmoking, no children or pets. On or nr. campus. Call Mary or John Felstiner, 322-7727.

□ **Jan. to Aug. '83:** Visit. prof., wife, 2 children (11, 8) seek 2-3BR furn. hse or apt. nr public schls, commute dist. to Stanf. WILL SWAP 3BR/2BA hse on 2 acres, 10 min. to U. of Mass Amherst. 1 hr. to Vermont ski, 1½ hr to Boston. Call COLLECT (413) 253-3287.

HOUSING AVAILABLE

□ **Avail. NOW:** College Terr. Twnhse, fully furn. to SHARE. 2BR/1BA, 2 story, frpl, lge. patio deck, cozy bckyd. Prof. empl. lesbian, 38, nonsmoker, seeks empl. lesbian hsemate. $385/mo + util + deposit. Call 327-3141 (day), 494-2292 (eve).

□ **Regularly avail.:** 1 & 2BR furn & unfurn. apts. & twnhses in Palo Alto & Menlo Pk. in good neighborhoods, close to campus. $525 to $800/mo. Call Shirley (415) 493-2321 or Jane at (415) 968-4957.

□ **NOW: HAWAII:** rustic hse in Haena, Kauai. 2BR/1BA, loft, indry, fully furn., sleeps 7. $280/wk. Call Nancy Scholl, 321-4407.

□ **Oct. 15, '82 to Jan. 10, '83:** Luxurious 2BR/2BA condo dwntwn Los Altos. 10 min. to Stanf. Fully furn., TV, all appl. $950/mo. Call (415) 948-1240.

□ **NOW, to share:** Lovely, quiet hse w/frpl, gardener, & priv. yd in So. Palo Alto. Female, nonsmoker. $300/mo. plus util. Call 493-9089 (eve), 966-3985 (day).

□ **April 1 to Aug. 31, '83:** Fully furn. 4BR/3BA campus hse. Contemp. style, 2 frpls, extensive patios, FR, gardener incl., fully sprinklered. 10 min. walk to campus center. Call (415) 857-9298.

□ **Feb. 1 to Sept. 1, '83:** 3BR/1BA fully furn. hse incl. linens, dishes, all appl. Gardening service, fenced bckyd. 2 car gar. 6 mi. to campus. Nr. shops, pub. schls. Call (415) 368-6722.

□ **NOW:** Alpine Meadows, Tahoe. 3BR/1½BA cabin, W/D, frpl. Sleeps 10. $200/wknd, $70/wk.night. Call 493-4139 (eve).

□ **Beg. Nov. 1 for 1 yr:** Atherton, 3BR/2BA, den, frpl, unfurn. hse, carpets, drapes. Patio, backyd. Call Wells Fargo Bank, (415) 855-7631.

□ **NOW:** Female roommate wanted to SHARE 2BR apt. in Menlo Pk., nonsmoker, no pets. W/D, 15 min. bike to campus. Call 497-3639 (day) or 321-4592 (eve).

□ **Nov. '82 to Mar. 15 (flex):** SHARE half 4BR/2BA fully furn hse, incl linens, dishes, w/fac. cpl. Bike to campus. No smoking, no pets, child ok. $500/mo + util. Call 326-4316 (morn. or eve).

□ **NOW thru spring qtr.:** 4BR/2BA, den, patio raised bed garden, Mayfield area of Mt. View. 25 min. bike to Stanf., 15 min. by car. $1100/mo, unfurn. Call Barbara (415) 941-5151 or (415) 948-5342.

□ **NOW:** FREE rm & brd for resp female in exchnge for hsekeeping & very limited childcare of 2 elem. sch. age girls. Sep. furn rm. San Carlos w/breathtaking view of bay. Easy walk to Samtrans. Call Dave, (415) 859-5047 (day), (415) 593-2936 (eve, wknd).

□ **Jan. 1 to Sept. 15 '83 (flex):** Fully furn. 4BR/2BA spac. campus hse, view of hills. No pets. $1600/mo, incl. gardener. Call Peter Hammond, 494-0362, or 497-3987 (day).

□ **NOW:** TAHOE DONNER HSE RENTAL. 4BR/3BA hse w/hot tub. Overlook natl forest. Frpl, wd stove. $150/wknd, $375/wk. Call 497-6421 (day), 324-8559 (eve).

□ **NOW:** Woodside. Tranquil 5BR/4½BA hse. Furn. optional. Library, DR, 3 frpl, all appl. kitchen, Indry. Pool, cabana, 5-horse barn. 15 min. to Stanf. Lease or lease option. Portola Valley schls. $3000/mo. Call (415) 851-2323.

Ph.D. oral exams

THURSDAY, OCTOBER 14

Eytan Bercovitch, anthropology, 12 noon, 111J.

FRIDAY, OCTOBER 15

Jerome Huck, electrical engineering, "Comparative Analysis of Computer Architecture," 10 a.m., ERL 401.

WEDNESDAY, OCTOBER 20

David John Kavanagh, psychology, "Mood, Self-Efficacy and Goals," 2:15 p.m., 358 Jordan Hall. **John Charles Reis,** mechanical engineering, "The Suppression of Turbulence in Combustion-Driven Magnetohydrodynamic Flows," 4:15 p.m., Room 300, Bldg. 300. **Danny Yeung-Foh Wang,** applied physics and electrical engineering, "Bunching of Relativistic Electron Beams at Optical Frequencies by the Stimulated Cerenkov Interaction," 2:30 p.m., Applied Physics 200.

THURSDAY, OCTOBER 21

Karen Maria Kosydar, chemistry, "Polymer-Bound Substrates: A System to Distinguish Between Homogeneous and Heterogeneous Catalysis," 2:15 p.m., Chemistry Gazebo.

Pauline Newman-Gordon

French faculty in local lectures

Five Stanford French professors will participate in a six-month program of lectures entitled "Dream Versus Reality: French Author Series," coordinated by Prof. Pauline Newman-Gordon of the Department of French and Italian.

The series will open with Prof. Leo Weinstein speaking on Honore de Balzac at 2:30 p.m. Sunday, Oct. 17 at the South Peninsula Jewish Community Center, 830 East Meadow Drive.

The rest of the lectures, all at 2:30 p.m. Sundays at the Community Center, are:

Nov. 21—Prof. Marc Bertrand speaking on Gustave Flaubert; Dec. 19—Prof. Pauline Newman-Gordon speaking on Marcel Proust; Jan. 16—Prof. Raymond Giraud speaking on Jean-Paul Sartre; Feb. 20—Prof. Yolanda Patterson of Hayward State University speaking on Simone De Beauvoir; and Mar. 20—Prof. Robert Cohn speaking on Albert Camus.

Mother's Club sets annual boutique

Members of the Stanford Mothers' Club have been busy since January preparing items for sale at their annual Chrysanthemum Party and Golden Boutique, this year to be held from 1 to 5 p.m. Sunday, Oct. 24, at Syntex, 3401 Hillview Ave., Palo Alto.

The $6 admission charge (pay at the door) provides scholarships for Stanford students. Last year the Club gave three full scholarships to deserving students.

Champagne, punch, and hors d'oeuvres will be served while guests browse among the many items for sale—Christmas ornaments, decorations, and centerpieces, etc.; handknits and crochets, embroideries and quilts from around the world; linens, books, purses, garments, and lots more.

Entertainment will include a fashion show by Saks Fifth Avenue, vocal music by the Stanford Mendicants, and tea dancing to the music of the Stanford Jazz Band. Television sets will be available for football fans to watch the day's pro football games.

Christine Egan of Los Altos Hills is chair of the event; Anne Hopkins is Club president.

SSRL users' meeting

The ninth annual Stanford Synchrotron Radiation Laboratory user group meeting will be held from 8 a.m. to 5 p.m. Thursday and Friday, Oct. 21-22, at SLAC.

The meeting will be devoted to scientific exchange—presentation of papers and discussion.

Sunrise Exercise group wants you too—at 6:45 a.m.

"Exercising three times per week will contribute to weight loss and improved cardiovascular health as well as provide many psychological benefits," says Lindy Birkel, coordinator of exercise for the Health Improvement Program (HIP) and co-instructor of Sunrise Exercise.

A group of Stanford Faculty and Staff (men and women) have been meeting together at Roble Field for Sunrise Exercise at 6:45 a.m. on Monday, Wednesday and Friday. They warm-up briskly and then walk-jog for approximately 30 minutes. They will walk less and jog more with the goal of eventually jogging continuously.

"The level of commitment is high in this group," says Birkel. "We have one member, Judi Anderson, who travels in from San Jose by 6:45 each morning."

The group also periodically enjoys coffee cake and orange juice after a workout.

Stanford faculty, staff and their families are invited to join the group for $5 per quarter. It is sponsored by the Health Improvement Program and is led by experienced exercise instructors Lindy Birkel and Cathlin Milligan.

For more information, call the HIP office at 497-7940.

Chances to dance abound on campus

Space is still available in some of the Dance Quorum classes offered during fall quarter at Roble Gym.

Faculty/Staff Noon Hour Dance (aka Dance for Lunch Bunch): Beginning group meets Monday and Wednesday and the continuing group Tuesday and Thursday in Studio 42; Joy Weston, instructor.

Ballet: Beginning at 6-7:30 p.m. Monday and Wednesday, intermediate 7:30-9 p.m. Monday and Wednesday, and all levels 12:30-2 p.m. Saturday in Studio 33; Elizabeth Larkam, instructor, and Bill Sorenson, pianist.

Floor Barre: 6-7 p.m. Tuesday and Thursday in Studio 42; Lisa Burnett, instructor.

Jazz: 6-7 p.m. Monday and Wednesday in Studio 42; Elizabeth Gustafson, instructor.

For further information on classes, call 497-4254.

Rho to teach mime and improvisation

The nature of physical movement, the meaning of gesture and expression and quite a bit more will be explored in a class series called Movement Improvisation, beginning at 7 p.m. Wednesday, Oct. 13, in Tresidder's Room 132.

Instructor Jong Rho, who founded and directed the Yale Mime Troup, offers a keener awareness of and greater facility in body movement and a heightened sense of creativity and self-confidence, plus the history and techniques of mime. His students can expect to contribute a great deal of energy and find freedom from their nasty physical and mental blocks.

The course costs $20. For more information, call Rho at 326-4121 or 327-3258.

Fourth-year medical student Paul Berger, born and raised in New York City, has found that photographing the natural beauty of this area is the perfect therapy to cope with the stresses of medicine. "Twenty Miles from Stanford," a selection of his work taken within biking distance of the campus, will be shown on the second floor of Tresidder Union through October.

Davidovich first in refurbished hall

The Lively Arts at Stanford will open its 1982-83 season in the newly refurbished Memorial Auditorium with Soviet-emigre pianist Bella Davidovich at 8 p.m., Friday, Oct. 15.

For the first time since Memorial Auditorium opened in 1937, it has acquired new seating.

"The 1,694 seats in Memorial Auditorium have been replaced by 1,721 deep red all-wool plush seats. The backs of the chairs are rosewood," said Vicky Holt, director of University Events and Services. "The carpet is also a deep red."

"A computer was used to plot a new seating pattern so that no one will sit directly behind anyone else. Each audience member can then have an unobstructed view of the performance.

"The first two rows of chairs can be pulled out to accommodate wheelchairs and allow the stage to be extended over the orchestra. There will also be a removable section of seats in the center section which will allow for a sound console to be placed there when needed.

"For the past five years we've been slowly bringing our performing facilities up to first-class standards. Considering the artists we have using them, it's about time," Holt said.

In addition to Davidovich, the following artists and ensembles also will perform in Memorial Auditorium this season: the Bella Lewitzky Dance Company, pianist Emanuel Ax, the Newport Jazz Festival All-Stars, violinist Oscar Shumsky, Paul Taylor Dance Company, Philip Glass, the New England Ragtime Band, violinist Charles Treger and pianist Andre Watts, the Oberlin Dance Company, and pianist Murray Perahia.

"it's indicative of Stanford's investment and commitment to the performing arts that money is being put into its performing facilities. The upgrading makes them easier to maintain and more efficient to operate," Holt said. "But the university also realizes that providing attractive theaters is a good way to attract more audiences and to sell more tickets to its shows."

Bowlers—join Tresidder leagues now

The Recreation Center at Tresidder Union is seeking members for its faculty and staff bowling leagues, now getting underway for fall quarter.

Leagues with current openings include the "Bowl for Lunch Bunch" leagues on Tuesdays and Fridays at noon, the four-person mixed handicap league on Mondays at 6 p.m., the intra-department league on Tuesdays at 6 p.m., the Wednesday Trios league at 8:30 p.m., and the Faculty-Staff Mixed Fours offered on Thursdays at 7:30 p.m.

The noon leagues consist of two-person teams bowling two games over lunch. The evening leagues on Monday, Tuesday and Thursday consist of four person, coed teams. Discount cards are also available for all league bowlers. Prearranged teams or individuals desiring placement with a league may sign up at the Recreation Center, located on the first floor of Tresidder Union, or by calling 497-4316.

For practice or some good family fun try the Sunday Night Special, from 6 p.m. to midnight for only 45 cents per game.

Patrons of the Recreation Center should also be aware that the entrance has been moved to the corner of the building next to the faculty club facing the back patio.

Art and book fair helps Museum programs

The Committee for Art at Stanford will hold its third Annual Art and Book Faire between 10 a.m. and 4 p.m. Saturday, Oct. 23 at the Gallery Bookshop and the Stanford Art Gallery.

A wide variety of good quality used hardbacks and paperbacks will be for sale at reasonable prices on the Art Gallery veranda. Attractive and inexpensive posters and art reproductions as well as picture frames will also be for sale.

New books, cards, calendars and other gift items will be available in the Gallery Bookshop for Christmas shopping.

Art Gallery docents will conduct tours of the current exhibit *Venetian 18th Century Art* at 1 and 3 p.m.

Proceeds from the Faire are used to support the education program of the Stanford Museum.

International Center offers varied calendar of events

Pacific Peacemaker crew to speak

Two crew members of the Pacific Peacemaker, a 54-foot ketch which sailed over 11,000 miles in a journey to protest nuclear proliferation, will speak at the International Center at 4:30 p.m. Tuesday, Oct. 19.

Skipper Bill Ethell and crew member Win Olive will show slides and speak of their journey from Australia to San Francisco and their efforts to promote greater public awareness of nuclear policy in the Pacific basin.

The Pacific Peacemaker stopped in New Zealand, French Polynesia, Hawaii and Seattle to voice protest over such policies as land rights, underwater nuclear testing, military bombing maneuvers and the Trident submarine.

The Peacemaker arrived in San Francisco today (Oct. 31). The boat is owned by many groups and individuals from all over the Pacific basin.

The I-Center and the United Campus Ministry are cosponsoring next Tuesday's presentation.

Lunch lecture features Kirk Hanson

Kirk Hanson, a lecturer at the Stanford Graduate School of Business will speak on "Corporations and World Poverty" at the October 19th Tuesday Luncheon-Lecture at the International Center.

Hanson will speak on the specific influence of major corporations on world poverty and the responsibilities of those corporations.

Hanson received his bachelor and master degrees from Stanford and has been a fellow at Yale and Harvard Universities. He also does extensive work in management consulting for major corporations. He also plays a leading role in many business organizations such as the Business Roundtable and the National Alliance of Business.

Luncheon tickets for Hanson's lecture went on sale yesterday at the I-Center. Only 40 luncheon tickets are available, at a cost of $2.50 each. The lecture is free and brown baggers are more than welcome.

Lewitzky Dance Company to include premiere in performance Oct. 22

The Bella Lewitzky Dance Company, "the dance company that put modern dance on the California map," will be presented by Lively Arts at Stanford at 8 p.m., Friday, Oct. 22, in Memorial Auditorium.

The program will feature a premiere of Lewitzky's newest work, "Continuum," performed to Stravinsky's "Duo concertant," for violin and piano. In addition, the company will perform Lewitzky's "Changes and Choices" and "Spaces Between."

The company will also present a free lecture-demonstration at 8 p.m., Wednesday, Oct. 20, in Memorial Auditorium. It will focus on "Continuum" and on dance in the west.

Lewitzky is a West Coast based choreographer, dancer, lecturer, and educator. Her early training was with Lester Horton. As his colleague, she co-founded the Dance Theater in Los Angeles in 1946, then one of the few institutions in the nation with both a school and performing theater of dance in a permanent house.

In 1951 Lewitzky founded Dance Associates with both a school of modern dance and a performing concert group. Lewitzky formed her present 10-member group in 1966. It is actively engaged in the National Endowment for the Arts dance touring program and has toured extensively in the U.S. and Europe.

In 1978 Lewitzky shared the most prestigious award in the dance field, bestowed by *Dance Magazine*, with Mikhail Baryshnikov.

Her philosophy is that "art is an ongoing process, and that the only constant is change." Her philosophy is reflected in the company's versatility in all its facets including the concerts; in its repertory, from conventional to experimental; and in its sounds, from classical to electronic.

The company has achieved international acclaim for its innovative and individualistic choreography—a uniqueness of style that reflects its California base and amplifies the tradition that "California has been the fountainhead of some of the strongest indigenous influences in American dance."

She believes that motion is a basic tool of education, that it should be as much a part of the learning experience as reading and mathematics.

Coffee House adds new back patio

After more than a year in planning, the Coffee House has expanded its service to include an outdoor back patio, providing approximately 130 additional seats as well as beer and wine service.

While construction has not been finished, additional stone walls and planters have been added to help provide better control of alcohol (which is not permitted outside the area).

With the addition of the new seating and the usual noon and dinnertime rushes, partial table service is now provided in order to reduce the amount of time spent waiting in line.

Customers will place their orders with any cashier on printed menu order cards. After paying and receiving any ready-to-go items such as cold beverages or pastries, they may then proceed to a table either inside or out. The order will be delivered as quickly as possible.

All hot food items will be prepared fresh by the kitchen staff along with the new chef's salad and wide array of sandwiches.

Customers wishing only pastry or beverage items need not fill out order cards, but may proceed directly to the express registers in the center of the Coffee House. Orders to go outside the Coffee House and the patio will be expeditied and delivered to a specifically designated area.

Japanese films slated Thursday

The second part of the film series, "The Human Face of Japan," will show at the I-Center tomorrow night (Thursday, Oct. 14) as part of the Other Cultures Film Series.

The three films slated for tomorrow night deal with social issues in modern Japan, focusing on the struggle between tradition and modernization.

"The Career Escalator" contrasts the lives of a Japanese student studying for University entrance exams and that of a fast-paced senior executive with the Mitsubishi Corporation.

The second film of the evening explores the different aspects and ramifications of the lives of dual-career couples in Japan. "The Working Couple" features the lives of a Tokyo pharmaceutical clerk and his shopkeeper wife.

Finally, "The Rice Ladle" depicts the role of women in Japanese society, featuring women in both modern career and traditional homemaker roles.

The films begin at 7:30 p.m. at the I-Center. Admission is free but a 75-cent donation is requested at the door. The Other Cultures film series is a continuing program at the I-Center. For more information about the film series or any other I-Center program, phone 497-1831.

Writer Roch Carrier due next week

Quebecan author Roch Carrier will speak on his work and his life in literature at the I-Center beginning at 3:30 p.m., Wednesday, Oct. 20.

Sponsored in cooperation with the French Department and La Maison Francaise, Carrier's visit will include the showing of a short film and a discussion of his literary work.

A noted author, Carrier is en route to Salt Lake City, Utah, to speak at the Rock Mountain Modern Language Association convention about modern literature. Carrier will address a conference entitled, "One day, literature met me, she was not afraid" about his work in literature and his life experiences.

Born in 1937, Carrier first published in 1964. Much of his work has been for theater or film. Carrier has translated from French to English many of his plays, which have been performed outside of Quebec. Some of his works include, "War, Yes Sir!" and "Is it the Sun, Philibert?"

As one of Quebec's foremost film critics, Carrier contributes to the magazine and newspaper literature of the province. In addition, in 1973 he also served on the panel of the Canadian Film Awards.

Carrier's discussion will be in both French and English, and the ensuing question period will be in both languages.

Charles Ferguson

Guitarist Ferguson to perform Oct. 23

Charles Ferguson, Stanford's lecturer in guitar, will perform at 8 p.m. Saturday, Oct. 23 in Dinkelspiel Auditorium.

Presented by the Music Department, his concert will include transcriptions of harpsichord, violin, and piano works by Couperin, Bach, and Albeniz. Spanish composers Fernando Sor, Regino and Eduardo Sainz de la Maza will be represented, as well as Venezuelan composers Rodrigo Riera (Ferguson's teacher in New York and Venezuela), and Raul Borges.

Tickets for Ferguson's concert Oct. 23 are $4 general and $2 students and senior citizens, available at Tresidder Ticket Office (497-4317) and the door.

Ermeler Duo set for Oct. 22 concert at Stanford

The Stanford Music Department will present the Ermeler Duo—Rolf Ermeler, flute, and Maria Ermeler-Lortzing, piano. The husband-and-wife team from Lubeck, Germany, will perform early Romantic and contemporary works at 8 p.m., Friday, Oct. 22 in Dinkelspiel Auditorium.

The first half of their program will be early Romantic: Hummel's *Sonata in D* for flute and piano; Beethoven's *32 Variations in C minor* for piano; Kuhlau's *Duo brillant* for flute and piano; and two works from Mendelssohn's *Sieben Charakterstücke*.

Contemporary works will be featured after the intermission: Otto Luenig's *Suite No. 1* for flute; Gerhard Brand's *Pantomimes* for flute and piano; excerpts from *Prole do Bebe* by Villa-Lobos for piano; and Alexandre Tansman's *Sonatina* for flute and piano.

A *Washington Star* review said: "They are artists of the first rank. I. . . heard Rolf Ermeler in Lubeck with his famous baroque ensemble. . . the playing of this superb flutist remained a glowing memory."

Tickets for the Ermeler Duo are $4 general, $2 students and senior citizens, available from Tresidder Ticket Office (497-4317) or at the door.

Open house for Berry

The Stanford Mid-Peninsula Urban Coalition, 860 Escondido Road, will hold an Open House from 4 to 6 p.m. Friday, Oct. 15, to welcome Sarita Berry as their new executive director.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Oct. 13 to cover the events of the week of Mon., Oct. 25 through Sun., Oct. 31.

LATE ANNOUNCEMENTS

Wed., Oct. 13. Stanford Staffers Aerobic Dance Demonstration: By Barbara Frey. Participation encouraged (wear comfortable clothes). Noon-1 p.m. Tresidder Upper Deck. (In case of rain, Chem. Engineering Gazebo.) Brown bag lunch.

Physics Dept. Colloquium: "The Dwarf Nova Outburst—A Hot Dam Instability" with Prof. J. Falkner, UC-Santa Cruz. 4:15 p.m. Physics Lecture Hall, Room 101.

EE 380 Computer Systems Laboratory Seminar: Topic TBA. Speaker, Werner Trattnig, S.U. 4:15 p.m. Terman Aud.

Roble Political Action Committee Debate: Between Victor H. Palmieri, chairman, Californians Against Street Crime, and Paul Stone, consultant for Citizens Against the Gun Initiative. 7 p.m. Roble Lounge. Open to all.

Thurs., Oct. 14. SACDF Political Speech: "The Nuclear Freeze and Related Defense Issues" by Tom Lantos, rep. from Congressional Disrict 11, running against Bill Royer. 7:30 p.m. Kresge Aud. Public invited.

Condensed Matter Physics Seminar: "Molecular Beam Epitaxy and Its Application to New Electronics Devices" with Prof. James Harris, S.U. 4:15 p.m. Applied Physics 200.

Sat., Oct. 16. Stanford Black Performing Arts Presents: "U-Zulu Dance Theater of South Africa." 8 p.m. Dinkelspiel Aud. $7 general, $5 students and seniors.

MONDAY, OCTOBER 18

Varsity Soccer: Vs. Westmont College. 1 p.m. Maloney Field.

Biological Sciences Dept. Seminar: "Regulation of the Cell Cycle in Early Amphibian Development" with Dr. Marc Kirschner, UC-San Francisco. 4 p.m. Herrin Lab, T175. Open to the public.

Numerical Analysis Seminar: "Multigrid Methods" with Randolph Bank, UC-La Jolla. 4:15 p.m. Math 380C.

Radioscience Seminars: "Introduction to the New Radioscience Computer Facility" with Calvin Teague, S.U. 4:15 p.m. McCullough Bldg., Room 127.

Stanford Film Society: "The Big Sleep." 7 p.m. Kresge Aud. $1.50.

Stanford Hillel Foundation: Kiddush L'Vanah Service, and Rosh Chodesh Cheshvan Celebration. 7 p.m. Hillel Lounge, Old Union Basement. Open to the public.

TUESDAY, OCTOBER 19

Transcendental Meditation Program: Learn about the current research into consciousness and the practical benefits of the TM and TM-Sidhis Programs. Noon in the Meyer Library, room 144, and at 7:30 p.m. in the Meyer Library, Room 147. Open to all.

I-Center Tuesday Lunch/Lecture Series: "Corporations and World Poverty" by Kirk Hanson, Grad. School of Business. Noon. I-Center. Lunch tickets available the week before, $2.50. Brown baggers also welcome.

Professional Opportunity Program for Ph.D.'s: "An Inside Look at the Academic Job Market." 3:15-5 p.m. CERAS, Room 204.

Applied Physics Colloquium: "Observation of the 2-Photon Doppler-Free 1^3S_1-2^3s_1 Transition in Positronium" with Dr. Steven Chu, Bell Laboratories. 4:15 p.m. Applied Physics 200.

Computer Science Colloquium: Speaker and topic to be announced. 4:15 p.m. Jordan 040.

Communications Design Seminar: "A Visit to the Chinese Telecommunications Industry" with Bruce B. Lusignan, S.U. 4:15 p.m. McCullough 128.

Fluid Mechanics Seminar: "How a Mermaid Washes Her Hair; Hydrodynamic Spreading of a Hank of Fiber" with Prof. Hilary Ockendon, Oxford Univ. 4:15-5 p.m. Skilling Aud. Public invited.

Music Dept. "Learning to Listen" Lecture: "Introduction to Mahler—Does Music Tell a Story?" by Prof. George Houle. 8 p.m. Annenberg Aud. $4 general, $3 Music Guild members, $2 students and seniors.

I-Center/Ecumenical Ministries Talk: The crew of the schooner, Pacific Peacemaker, which travelled from Australia and New Zealand to Fiji and nuclear testing sites in the Pacific and Puget Sound will speak of the voyage and their vision of a nuclear-free Pacific. 4:30 p.m. I-Center. Public invited.

WEDNESDAY, OCTOBER 20

Ecumenical Ministries Wednesday Lunch Discussion: "The Mental Health of Workers" by Lee Shore. Noon. Zapata (Stern Hall) dining room. Bring bag lunch or arrange to eat at Zapata. Directed reading credit available.

CROW Women at the Top Lecture Series: Marion Sandler, president and chief executive officer, World Savings and Loan Association, will speak. Noon. Kresge Aud. Open to all.

Physics Dept. Colloquium: "Fundamental Nuclear Oscillations and Electron Scattering" with Prof. Karl Van Bibber, S.U. 4:15 p.m. Physics Lecture Hall, Room 101.

EE 380 Computer Systems Laboratory Seminar: "Design for Testability" with Prof. Ed McCluskey, CSL. 4:15 p.m. Terman Aud.

Electronics in Medicine Seminar: "Data Sources for Digital Radiography" with Dr. Paul Scheibe, ADAC, Inc. 4:15 p.m. McCullough 134.

Colloquium of the Dept. of Chemical Engineering: "Mechanisms of Foam Flow in Porous Media—Apparent Viscosity in Smooth Capillaries" with Dr. George Hirasaki, Shell Development Company, Houston. 4:15 p.m. Chemical Engineering Conference Room.

The Lively Arts at Stanford Lecture/Demonstration: By members of the Bella Lewitzsky Dance. 8 p.m. Memorial Aud. Free.

THURSDAY, OCTOBER 21

Transcendental Meditation Program: See details for Tues., Oct. 19. Noon. Meyer Library, Room 144.

Solid Mechanics Seminar: "The Mechanics of Dynamic Crack Propagation in a High Strength Steel" with Prof. Ben Freund, Brown Univ. 4:15 p.m. Skilling Aud.

Water Polo: Vs. Pepperdine. 4:30 p.m. deGuerre Pool. $2 adult, $1 child.

I-Center Other Cultures Film Series: "Cities of the World." "Melina Mercouri's Athens," and "Peter Ustinov's Leningrad." 7:30 p.m. I-Center. 75 cent donation at the door.

Stanford Synchrotron Radiation Laboratory: Ninth annual User Group meeting. 8 a.m.-5 p.m. SLAC. (Meeting continued tomorrow, same details.)

FRIDAY, OCTOBER 22

Stanford Synchrotron Radiation Laboratory: See Thurs., Oct. 22 for details.

Water Polo: Vs. UCLA. 3 p.m. deGuerre Pool. $2 adult, $1 child.

Applied Mathematics Seminar: "Some Aspects of Fracture Mechanics" by Prof. George Herrman, S.U. 3:15 p.m. Room 380C (Mathematics Corner Basement).

Materials Science & Engineering Dept. Colloquium: "Zircaloy Core Materials in Light Water Reactors" with Dr. J. T. A. Roberts, EPRI. 3:30 p.m. Peterson Laboratory, Room 550A.

Women's Volleyball: Vs. UCLA. 7:30 p.m. Maples Pavilion. $2 adult, $1 child.

Music Dept. Concert: Ermeler Duo. Rolf Ermeler, flute; Maria Ermeler-Lortzing, visiting from Lubeck, Germany. Early romantic music by Hummel, Mendelssohn, von Weber, F. X. Mozart, John Field, and Kuhlau. 8 p.m. Dinkelspiel Aud. $4/$2.

The Lively Arts at Stanford: Bella Lewitzsky Dance. "Changes and Choices," "Continuum" (working title), a premiere, and "Spaces Between." 8 p.m. Memorial Aud. $10.50, $9.50, $8.50, $7.50; students $3 off these prices.

STARTS Great Directors Film Series: "Paris Nous Appartient (Paris Belongs to Us)" dir. by Jacques Rivette, prime mover of the New Wave Cinema. 8 p.m. Geology Corner, room 320. $3.75 general, $2.75 students.

SATURDAY, OCTOBER 23

Ecumenical Ministries Conference on the Arms Race and National Security: At 9 a.m., a panel with Dr. Robert North, Dr. Phil Farley, Dr. Condi Rice. At 10:30 a.m., "Nuclear Weapons Policy and National Security" with Dr. Bob Parker, Dr. Gloria Duffy, Mr. Dave McFadden. At noon, workshops. At 2 p.m., the Soviet Peace Delegation. At 2:45 p.m., a reception at the I-Center. Meetings in Dinkelspiel Aud. and reception open to all.

Art and Book Faire: Art work and good quality used books for sale 10 a.m.-4 p.m. The Gallery Bookstore and Stanford Art Gallery.

Water Polo: Vs. UC-Irvine. 11 a.m. deGuerre Pool.

School of Education/SIDEC Lectures: "Higher Education and the Limits of Relative Autonomy: The Transformation of the Community College" by Jerome Karabel, Huron Institute, Cambridge, Mass. 9 a.m. "Education, Socialism and Struggle in Mozambique" by John S. Saul, Univ. of York, Canada. 1 p.m. "Education and Social Transformation: La Crusada de Alfetizacion in Nicaragua" by Ernesto Vallecillo, Ministry of Education, Nicaragua. 4:30 p.m. Three lectures all in Bishop Aud. Public cordially invited.

Varsity Soccer: Vs. St. Mary's College. 1 p.m. Maloney Field. $2 adult, $1 child.

Women's Volleyball: Vs. Arizona State. 7:30 p.m. Maples Pavilion.

Music Dept. Concert: Charles Ferguson, guitar. Works by Couperin, Bach, Albeniz, Sor, Riera. 8 p.m. Dinkelspiel Aud. $4/$2.

SUNDAY, OCTOBER 24

University Public Worship: Student Worship Service, 8:30 a.m.; Robert G. Hamerton-Kelly, dean of the chapel, 11 a.m.; Catholic Mass, 4:30 p.m.; Evening Communion in Memorial Church Round Room, 6 p.m.

School of Education/SIDEC Lecture: "Class, Gender and Curriculum Control" by Michael W. Apple, Univ. of Wisconsin. 11 a.m. Bishop Aud. Public welcome.

Women's Volleyball: Vs. Arizona. 3 p.m. Maples Pavilion.

ASSU Sunday Flicks: "Rocky III." 7 & 9:30 p.m. Memorial Aud. $1.50.

Mothers' Club Chrysanthemum Party and Boutique: Children's toys, Christmas ornaments and fireplace decorations, baby items, etc. 1-5 p.m. Syntex Corp., 3401 Hillview Ave., P.A. Proceeds to the Club's student scholarship fund. Public cordially invited.

EXHIBITS

The Stanford Museum is closed until the strike is resolved. After that, there will be **Paul Harris—Still Life.** Through January 2.

The Stanford Art Gallery is also closed. After the strike is resolved, there will be **Venice in the 18th Century.** Paintings, drawings, prints and decorative arts. Through December 19.

The Map as Landscape. Familiar and new aspects of Western landscapes by Donna Van Dijk. Bechtel International Center. Month of October.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through November.

Wood Construction and Process Sculpture E. David Camardo. For library environment. The Jonsson Library of Government Documents, Green Library. Through December.

Thirty Miles from Stanford. Photographs by Paul Berger. Tresidder 2nd floor gallery. Month of October.

Paintings on Canvas by David Cusic. Coffee House Gallery. Month of October.

VISITORS FROM OTHER COUNTRIES

Oct. 18: The Hon. Kenneth Baker, minister of State for Industry and Commerce, United Kingdom.

Mr. Mario Nordio, foreign affairs "Il Piccolo" Triste Daily, Italy.

Mr. Mustafa Awad Allam, director of telecommunications, Sudan.

Mr. Bengt Wennerberg and Mr. Alf Olofsson, Trade and Industry, City of Gothenburg, Sweden.

Dr. Helga Koernig and Dr. Helmut Sauer, Fulbrighters, min. of science of North Rhine-Westphalia, Duesseldorf, West Germany.

Oct. 20: Author Roch Carrier—writer, poet, playwriter from Quebec. Film, talk on Canadian Quebec literature, readings, discussions at 3:30 p.m. at the International Center.

Dr. Klaus Brockhoff, dean of the Graduate School of Business, Albrechts University in Kiel, West Germany. (20, 21, 22)

Oct. 22: Group of 15—Helsinki School of Economics, Finland.

Oct. 25: Kohji Okamoto, political science, Ehime Univ. Japan.

Dr. Ivan Grossi, CINECA, Inter-univ. Computer Center, Italy.

For further information, please call 497-1984, International Visitors, Maria Bun.

CAMPUS REPORT

Volume XV, Number 5 | A publication for Stanford University faculty & staff | October 20, 1982

NAS panel suggests bar on foreigners

Proposals to bar selected foreign nationals from direct participation in unclassified research on campus are troublesome, says Stanford Vice-Provost Gerald Lieberman, dean of graduate studies and research.

The proposals are contained in a newly published report by a National Academy of Science panel. It concluded there had been substantial and serious leakage of U.S. technology to the Soviet Union but said open scientific communication and exchange, especially by universities, played "a very small part" in this process.

"In general, the NAS report is a thoughtful document which attempts to balance the interests of the universities and the federal government," Lieberman says.

Instead of imposing the International Traffic in Arms Regulations (ITAR) and Export Arms Regulations to academic activities, it suggests that direct participation in government-sponsored projects by nationals of designated foreign countries be prohibited in certain "grey areas" of research. No attempt would be made to limit physical access to university space or enrollment in any classroom course of study.

Where direct participation in research is prohibited by an individual's visa or contractually agreed upon by the university, the NAS panel said, it is not inappropriate for the contracts to permit the government to ask a university to report those instances where stipulated foreign nationals seek participation in research, however supported. While some

Better the arrow should point in the proper direction than the sign should read correctly, the Kappa Alpha brethren decided. It's a topsy turvy world anyway.

Stanford may stay with quarter system–Good

Stanford probably will stay with an academic calendar based on the quarter system, as it has since 1916, a preliminary report to the Faculty Senate indicated Thursday, Oct. 14.

The University of California at Berkeley has announced plans to change to the semester system next year. A recent national survey showed more than half America's colleges now are on the early semester calendar, with classes running from August through May. More than 25 percent have calendars based on the quarter system.

Prof. Edwin M. Good, religious studies, head of the Ad Hoc Committee to Study the Length of Terms of Academic Instruction, said this 13-member group "came to realize. . .that each system is very good for certain educational values. . .(but) no system is good for all of them."

He said the committee report "probably will encourage experiments in individual departments in overcoming the limitations of the quarter system," such as offering more two-quarter course sequences in the humanities. In general, a great deal more thought needs to be given to the articulation of curriculum—how various courses join one another.

While personally favoring the semester system, Good said the committee deliberations covered a wide range of alternatives, including the possibility of having six five-week terms per year. The complexity of this alternative would result in an "excessive" load on the academic advising system, Good said.

He emphasized that the committee

Rosenzweig named president of AAU in D.C.

Robert Rosenzweig

Robert M. Rosenzweig, 51, Stanford vice-president for public affairs, will become president of the Association of American Universities in January, 1983.

The Washington-based association includes 52 leading American and Canadian research universities.

Rosenzweig coauthored a major AAU study on "Research Universities and their Patrons," an examination of university-industry-government relations published earlier this year by the University of Califoria Press.

His selection was announced at the AAU's fall meeting in St. Louis Monday, Oct. 18, by Indiana University President John Ryan, chairman of the AAU.

Rosenzweig will succeed Thomas A. Bartlett, who was named chancellor of the University of Alabama last July.

Harvard President Derek Bok headed a national search committee whose members included Stanford President Donald Kennedy, University of California President David Saxon, University of Michigan President Harold Shapiro, Ryan, and Jack Peltason, president of the American Council of Education, who served ex-officio.

In recent public comments, Rosenzweig has sharply criticized legislation linking student financial aid to draft registration. He also has suggested that California's public institutions should adopt "realistic" tuition levels to maintain their educational quality, while expanding financial aid for needy students. He is immediate past president of the Association for Independent California Colleges and Universities.

Colleagues at Stanford have credited him with the "Rosenzweig rule" for integrity in decisions—that policy makers

Wellbery, Sag, Mellor, Boxer, Schupbach receive dean's award for teaching

Five faculty members in the Stanford School of Humanities and Sciences have received the 1982 dean's award for superior teaching, Dean Norman K. Wessells has announced.

They are: Assistant Profs. David Wellbery, German; Ivan Sag, linguistics; Associate Prof. Steven G. Boxer, chemistry; Profs. Anne Mellor, English; and Richard Schupbach, Slavic languages and literatures.

Each will receive a salary increase of $750 above and beyond that normally given.

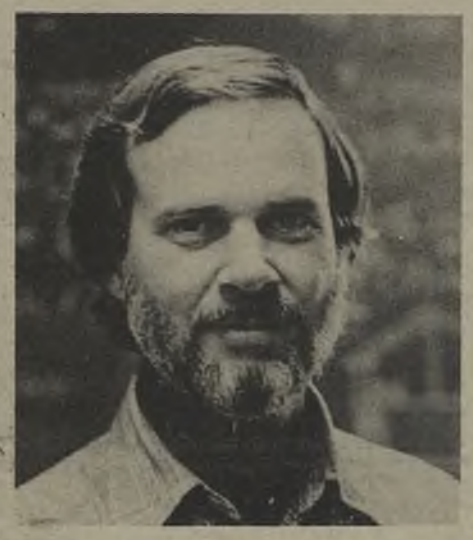
The recipients were chosen by the dean and an ad hoc faculty committee who used recommendations and evidence presented by individual departments.

Items considered were peer evaluation of the faculty member's teaching; peer evaluation of course planning, organization, and development; students' response to classroom instruction; teaching activities and contact with students outside class; and effectiveness in directing dissertations and other special projects.

Wellbery joined the faculty in 1975. His scholarship concerns the history of German thought. His course on this topic deals with texts that are philosophic and esthetic in orientation. His current work concerns the poetry of Goethe. His is known both for the intensity of his intellectual concerns and for his ability to convey these to a broad spectrum of undergraduates.

Sag came to Stanford as an Andrew Mellon postdoctoral fellow in 1978. He has devised several new courses in linguistics, played a key role in the new linguistics major, and developed new courses for both the master's and Ph.D. programs. He has involved students in conference organization, publication, and research. His primary research area is formal syntax, semantics, and pragmatics.

Boxer joined the faculty in 1976 and was promoted to tenure this fall. He received a Henry Dreyfus teacher-scholar grant in 1980. An Alfred P. Sloan Foundation fellow, he combines high intellectual standards with strong enthusiasm for his students' development.



He has organized new courses and revised old ones, making them available to a wide variety of students. His main research interest is understanding photosynthesis, how plants use the sun's energy to convert carbon dioxide and water into organic compounds.

Mellor has directed undergraduate studies in English for the past three years, serving as the principal academic adviser for more than 100 students. She has directed the new program in feminist studies and recently became head of the Faculty Committee on Committees. A Stanford faculty member since 1966, she often has been a guest lecturer in her colleagues classes. She is the author of *Blake's Human Form Divine* and *English Romantic Irony*.

Schupbach, a Stanford faculty member since 1971, has developed computer-aided instruction programs for first- and second-year Russian and created a videotaped program in third-year Russian, showing how the language is used in living situations. He also has a third-year program to make students "free readers" of Russian. He trains teaching assistants for the first-year course through weekly conferences and frequent classroom visits. By developing instructional material suitable for use on Apple computers, he has been able to use more time with students for the introduction and explanation of new material.

Warren Hausman

Gilbert Masters

Kays appoints Masters, Hausman

The appointments of Prof. Gilbert M. Masters as associate dean of engineering and Prof. Warren H. Hausman as chairman of the Department of Industrial Engineering and Engineering Management have been announced by Engineering Dean William Kays.

The appointments were effective Sept. 1.

Masters was the 1981 recipient of the prestigious Walter J. Gores Award for excellence in teaching. He was cited by a senior class at Stanford as one of three professors having the most significant impact on their undergraduate program.

After receiving his B.S. and M.S. in electrical engineering from UCLA and his Ph.D. from Stanford in 1966, Masters decided in 1970, at age 30, that his real interest was civil engineering, particularly solar energy. He has taught several classes in energy and resource management, including the popular CE 176, "Small Scale Energy Systems."

Hausman, who joined the Stanford faculty in 1977, received his B.A. in economics from Yale in 1961 and his doctorate in industrial management from MIT in 1965. His area of expertise is production and operations management and analysis, to which he has made major contributions in the analysis of multi-stage, multi-product scheduling, and the incorporation of forecasting in sequential decision problems.

Hausman won two teaching awards when he was on the faculty of University of Rochester.—**Amy Bernhard**

Trustees elect John Packard to board

John T. Packard, San Francisco investment counselor, has been elected to a five-year term by the Stanford Board of Trustees, effective immediately.

University alumni elected Packard to a four-year term in 1978. He served as chairman of the Committee on Investments and as vice-president of the board before completing his first term in office last July.

Under his leadership, the Committee on Investments formed subcommittees on real estate, policy, and venture capital to facilitate its work. Packard also served on the Trustee Committee on Finance and Administration, the Special Committee on Investment Responsibility, and the Subcommittee on Venture Capital.

Packard graduated from Stanford in 1956, received his MBA here in 1961, and was honored with a Golden Spike award from the University in 1975. His wife and daughter are both Stanford alumni.

Sports line: 497-1111

Call the new Cardinal Sports Line (497-1111) for the latest scores and schedules in Stanford sports.

Prof. Charles Yanofsky of the Stanford Department of Biological Sciences has received the V.D. Mattia award of the Riche Institute of Molecular Biology.

Named for the former president and chief executive officer of Hoffman-LaRoche, the award citation said "Our present understanding of gene structure, arrangement, function, and regulation owes as much to Charles Yanofsky as any other individual.

"His work bears the stamp of originality; it is elegantly and thoroughly executed and brilliantly interpreted. His discoveries provide the foundation upon which developments in egnetic chemistry of higher organisms and man are being built."

The award was presented to Yanofsky Oct. 4, at the Roche Institute in Nutley, N.J.

Wall hangings by **Kirsten Andresen Seaver** will be shown at the **Victoria Emmons** Restaurant Oct. 26 to Dec. 18.

Both Seaver and Emmons are Stanford faculty wives with European backgrounds. Seaver, a native of Norway, is a writer and translator as well as an accomplished needlewoman. Emmons, who was born in Nice and met her husband in Moscow, recently opened her restaurant at 2699 Middlefield Rd., Palo Alto.

Stanford's Board of Trustees has named six faculty and five students to committee membership, and approved two observers from the Associated Students to committees.

The appointments are as follows:

Committee on Investments: **Prof. James C. Van Horne**, Graduate School of Business; **Craig Albright**, student.

Committee on Academic Affairs and Development: Profs. **John Freccero**, French and Italian, and **Theodore H. Geballe**, applied physics; **Jerusha A. Stewart** and **Steven P. Westly**, students; **Rod A. Beckstrom**, ASSU observer.

Committee on Finance and Administration: **Profs. Richard H. Jahns**, applied earth sciences and geology; and **Lyle M. Nelson**, communication; **Robin A. Cooper** and **Susan Mensinger**, students; **R. Mark Epstein**, ASSU observer.

Committee on Nominations: **Prof. Eleanor Maccoby**, psychology.

Two former Stegner Fellows in Stanford's Creative Writing Program have won the top prizes in the prestigious *Transatlantic Review* Fiction Awards, established by the Henfield Foundation.

Program director Prof. John L'Heureux said **Harriet Doerr**, currently a non-matriculated graduate student, won the first prize of $2,500, and **Dennis McFarland**, now a Jones lecturer in fiction writing, won the second prize of $1,000.

The foundation invited 21 colleges and universities to submit work by no more than three students. From the 63 entries, 10 prizewinners were selected. Stanford's was the only program to have both a first and second prizewinner.

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.

Published by the Stanford University News Service, Patricia J. Black, editor; Karen Marman, design assistant; Charles Painter and Ed Souza, photographers; Medicals news editor, Lisa Ames, ext. 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

To produce more we must save and reinvest more: Pencavel

BY DONALD STOKES

A key to revival of American industry is an increase in the amount of savings and investment.

Labor and management have a common interest in seeing more profits allocated to new machinery and research, so that productivity can be increased, and both sides subsequently will have a bigger cake to enjoy.

So says John H. Pencavel, professor of economics at Stanford, who has gained a national reputation for his studies of labor-market economics.

"Most U.S. labor leaders are aware that reinvestment is the path to more jobs and higher pay. However, they also know that they look better to their rank and file if they concentrate on wage issues" said Pencavel, in a campus interview.

"The way most contract negotiations are reported in the media suggests the metaphor of a pie which is being divided, with each side trying to get the bigger slice. There is some truth in that, but a more relevant issue is not the size of the pie, or even how it is divided, but how it is growing in size.

"The truth is that the interests of both sides are in seeing the pie grow. In other words, the greater the rate of change in productivity and profitability, the more there will be for each side.

"If all corporate net profits in the U.S. in 1981 were sequestered and distributed equally among all the wage and salary workers in the economy, then the average compensation of those employees would rise by less than seven percent, and this would be a once and-for-all increase.

"It would probably be far better for all concerned if these profits were ploughed back into investment, in activities with high rates of return.

"Look at how that process benefited Germany and Japan. Though back in 1950 the per capita income of both those countries was low, by investing a large fraction of their national income they have caused their respective national pies to grow enormously.

"Japan's savings ratio, the proportion invested and put back into research and development is on the order of 30 percent. The savings rate in the U.S. has been lower than that of almost every other industrial country.

"This is one of the major reasons why America has fallen behind Japan and Germany in the rate of growth of productivity.

"Unfortunately, if an American labor leader were to suggest to a mass meeting of his members that instead of increases in wages the profits of the company should be ploughed back into better machinery, so that productivity could be increased, a typical worker would say 'To hell with that, I want the money now.'

"Labor and management in the U.S. are not natural enemies. By agreeing to put more into reinvestment rather than increasing dividends or wages, they would create bigger pies for tomorrow.

"The common impression that labor-management relations in this country are adversarial, while those in Japan are cooperative, is not accurate.

"The way that working conditions in Japan are often described is true only of a certain number of firms. It is widely believed in America that Japanese workers and managements sit down together and jointly make their decisions. Also, we think that Japanese workers are more or less guranteed lifetime jobs.

"These beliefs are true of many of the largest corporations in Japan, but they are not true of the whole country. In fact there are a large number of Japanese workers who are subject to the whims of market conditions in much the same fashion as in the U.S.

"Many Japanese companies subcontract work, and it is these subcontracting firms that feel the effects of variations in the demands for products of major firms.

"So, in the event of a reduction in the demand for the products of a firm, though all the workers at many major Japanese corporations remain employed, the workers at the various smaller firms that supply parts under subcontract may be severely affected."

Nor is it true, says Pencavel, that there is a constant fight in the U.S. between management and labor. "That is sometimes true of certain firms, or even industries, but it is wide of the mark for the country as a whole."

But hasn't nearly every major industry in the U.S. been rocked by strikes at some time during the last two decades?

"No, many have not," said Pencavel. "For example, the agricultural, distributive trades, service, real estate, insurance, and finance industries. All these industries together account nowadays for almost half of total employment in the American economy.

"For all industries taken together, less than point two percent of total working time (that is, less than two out of every 1,000 hours) were estimated to have been lost because of strikes in 1977 and 1978.

"Fundamentally, a primary reason why, for the economy as a whole, strikes are so unimportant is that only 20 percent of the American labor force belong to trade unions, and virtually all strikes are organized by unions.

"Even in those areas where strikes do take place, most union members work under contracts which run about three years, and the strikes usually take place, if at all, at the end of the contracts. Few industries of any importance have strikes except at these three-year intervals, and even then by no means always.

"There is one major exception, the coal-mining industry during the last decade, which has had strikes during the lives of its contracts—but these strikes have reflected not struggles between labor and management, but between factions within the union.

"We are inclined to think of the U.S. as a much more unionized and strike-prone economy than is actually the case. When the United Auto Workers sign a new contract, for example, it is big news, as it should be, but we should not lose sight of the slow inexorable wage increases that nonunionized workers get continuously.

"The proportion of union members out of the whole body of workers has been going down for the last 30 years," he noted. "At one time 25 percent of the labor force was unionized, but today it has gone down to below 20 percent.

"The unions have really been on the defensive since about 1953."

Part of Pencavel's research has been to try to measure the effect of trade union activity on the course of wages.

"If we look at the historical record, the wages paid to workers change at different rates over time and they also change at different rates for different classes of workers.

"What is the reason for this? Why is one industry increasing wages by, say, seven percent, while another gives half that? One obvious conjecture is that it has something to do with trade union activity.

"Surprising as it may seem to a noneconomist, it is very difficult to show with any confidence that there is a relationship between the change in wages over time and trade union militancy.

"Considerable research has gone into this question. There are some examples of wages being pushed up by union militancy, but by and large there are not many indications that wages move very closely with union militancy.

"What really determines the rates of change of money wages, and also the rate of change of real wages (that is, the purchasing power of wages) is the rate of growth of productivity."

Pencavel agreed this meant that if people worked harder they stood a better chance of being paid more. He added that another important factor was that, if capital equipment were increased, more

The savings rate in the U.S. has been lower than that of any other industrial country. This is one of the reasons why America has fallen behind Japan and Germany in the rate of growth of productivity.

—John Pencavel

could be produced, and that the workers would share in the returns from increased productivity.

"Many workers are reluctant to accept this notion," said Pencavel. "In many countries, a certain number of companies have been owned and managed by the workers, and in such cases the rates of capital investment tended to be low.

"The tendency in such cases was for profits to be put into wage packets rather than into reinvestment, so the rate of change in productivity was often sluggish. This has been true in all countries where there are labor-managed firms—in the U.S., Britain and Yugoslavia.

Pencavel was asked what happened when a corporation such as Sears Boebuck either allocated shares in the company to workers, or offered attractive terms for them to purchase shares, the objective being to raise the commitment of the workers and so boost productivity.

"It's not clear," said Pencavel. "Insufficient studies have been done on that issue. What appears to be the case is that the workers simply sell their shares soon after receiving them.

"Again, we have to look to Japan for a method that seems to work out better. Most Japanese workers receive their pay in two parts. The first is a flat sum which is given irrespective of the condition of the company. The other part is a bonus, typically received twice a year, which reflects in part the profitability of the company.

"This second part constitutes a large fraction of the worker's earnings, something like 25 percent.

"This method means that in effect a Japanese company can reduce its workers wages if sales are not going well, and can increase them when things are going well. It is sometimes very difficult for an American company, when it hits bad times, to reduce wage costs."

Asked to compare the results of the American

Italy came to la Casa Italiana last week in the person of Elio Gabbuggiani, mayor of Florence, who spoke on the Italian Communist Party and international politics and then fielded questions from his audience. With him were San Francisco's Italian Consul, Alessandro Vattani, and several members of the Florence city council. Gabbuggiani is in California to return the visit of San Francisco Mayor Dianne Feinstein to Florence in September.

Alumni schedule tax seminars

A four-evening seminar on preparation of income tax reports will be held at Stanford beginning Tuesday, Nov. 9.

"A Practical Guide to the Income Tax," will be taught by Noelle Allen, a certified public accountant and instructor in taxation. Sponsored by the Stanford Alumni Association, the program will be held on Tuesday evenings, from 7:30 to 9:30 p.m. Nov. 9, 16, 23, and 30.

The Nov. 9 session will cover basics such as itemized deductions, special tax computations, and the IRS audit process. The second session will look at 1981 and 1982 tax law changes to assist in tax planning. Subjects covered will be individual retirement accounts, marriage penalty deduction, tax rate changes, and stock dividend reinvestment programs.

On Nov. 23 there will be a discussion of the mechanics of the capital gains computation, and long- and short-term transactions. The final session on Nov. 30 will focus on the treatment of real estate and business assets, including Accelerated Cost Recovery System, investment tax credits and recapture of depreciation.

Participants may attend all sessions or select those in which they have a particular interest. Fee for individual sessions is $30; for the entire seminar, $100.

Further information may be obtained by contacting the Continuing Education staff at the Alumni Association, 497-2021.

Rosenzweig...

continued from page 1

should make judgments that they would feel comfortable explaining to reporters from *The New York Times* or 60 Minutes.

In comments to the Faculty Senate at Stanford, President Kennedy has repeated praised Rosenzweig and his staff for "extraordinarily effective" representation of the University's interests in Washington.

Besides federal, state and local relations, Rosenzweig oversees the University's Events and Services Office and News and Publications Service. He worked closely with Kennedy on the Pajaro Dunes conference of university and business leaders concerning biotechnology last spring.

In Congressional testimony last June he said there was "substantial convergence" on five principles for university-industry relations:

1) "Openness is to be preferred to secrecy;

2) "The educational experience of students and postdoctoral fellows has priority over the need to fulfill commercial obligations;

3) "University policies should protect the role of the institution and its faculty as credible and impartial resources in debates on scientific and technological policy;

4) "The choice of scientific questions to investigate must reside with the faculty who will do the research; and

5) "The primary obligations of faculty members are to their teaching and research."

In his recent AAU study, Rosenzweig concluded that public demand for rapid solutions to problems in defense, space exploration, health care "and now industry productivity and innovation" can be "so overpowering" that it distorts institutional purposes, unbalances programs and compromises high standards of quality.

"The key to returning stability to graduate education lies in avoiding sudden, sharp shifts in enrollment. Changes occur naturally enough over time as individual career choices respond to changing intellectual currents and economic realities," he said.

Rosenzweig argued for an expansion in federal funding of exisiting programs for portable graduate fellowships.

In Congressional testimony last March, Rosenzweig argued that America's security, health and prosperity all reflect the benefits of an open society, particularly where scholarly research is concerned. While other countries may benefit from this openness, it is a key factor in maintaining America's scientific advantage. "We tamper with it only at our peril. The cure could be worse than the disease. . . .

"It has always seemed risky to run an open society; perhaps that is why there are so few of them. But when citizens and leaders alike have been willing to take the risk, as ours have been willing to do throughout history, the most marvelous engine of creativity is set in motion.

"That is our real advantage. Why should we want to give it away?"

A former Congressional fellow of the American Political Science Association, Rosenzweig was special assistant to the U.S. Commissioner of Education before coming to Stanford in 1962.

A graduate of Michigan (B.A., 1952; M.A. 1953) and Yale (Ph.D., 1956), he taught at Yale and Amherst before coming here as associate dean of the Graduate Division and lecturer in political science. In 1967, he was named first director of the Center for Research in International Studies. In 1971 he was named vice-provost and in 1974 became Stanford's first vice-president for public affairs.

Born in Detroit Aug. 27, 1931, Rosenzweig lives in Palo Alto with his wife, Adelle, and their children, Kathryn and David. They plan to move to Washington in the spring.

Pencavel...

continued from page 3

system of management with that of the Soviets, Pencavel said that in the U.S. the risk is that labor might secure gains at the expense of capital investment. In Russia the unions are rubber stamps for middle management which is often preoccupied with cooking the books so as to make the results look as good as possible to the all powerful political hierarchy.

In spite of the wealth of statistics about labor turnover in the U.S. there are no clear answers about several quite basic questions, Pencavel went on. "There are two categories of explanations in understanding why people change jobs, why some people have a repeated pattern of switching jobs while others seem to stay put.

"One explanation is simply that individuals are intrinsically different, there are 'movers' and there are 'stayers.' The other explanation is that *intrinsic* differences among individuals are insignificant, but that they *become* different by experiencing different circumstances and by being subject to different (and random) shocks.

"These two categories of explanations are at the heart of a great deal of research into human behavior, not merely the research into labor turnover, but also that into criminology, work behavior and demography.

"In studies of labor turnover we try to allow for the particular characteristics of the work involved—the wage rates, the pace of work required, and so on. It is well known that young people are more likely to quit than older ones. Manufacturing work tends to have a higher rate of turnover than many service industries. The building industry, for example, has a high rate of job-changing."

Much of Pencavel's research in recent years has been in seeking explanations for differences in wages, not only among various classes of workers, but also among different geographical locations. He has also conducted research into differences in hours of work among individuals.

Pencavel was born in a London suburb just after a bombing raid during the Nazi blitz. The family also survived a V2 rocket which exploded nearby.

He went to the University of London, where he gained his M.Sc (Economics). At the age of 21 he was given a fellowship to Princeton, which he developed into doctoral studies, and he obtained his Ph.D. in 1969. His thesis was on labor turnover. He came to Stanford in that same year and has been here ever since.

Pencavel recently started to work with the *Journal of Economic Literature*, the prestigious publication of the 20,000-strong American Economic Association. It is edited at Stanford by Moses Abramowitz, emeritus professor of economics at Stanford, who is president of the Association.

Pencavel is married to Louise Smith, who is a freelance photographer. As this goes to press they are expecting their first child. **FLASH: It's a boy!**

Early career counseling helps students make better choices

Early involvement with undergraduates by college career counselors helps students make more thoughtful and intellectual career choices, according to Christopher Shinkman, new director of the Stanford's Career Planning and Placement Center.

And it may even help students get more out of college.

"A major task for career counselors, and one that is crucial in the early years of the student's college experience, is to establish links between career development and what goes on in the classroom," he declares.

"On a very basic level, it should be easy to see the connection between the kind of information gathering, research, and analysis required in the classroom and that called for in the job search.

"The development of the ability to understand other people (is) central to the academic mission and particularly to the role of the liberal arts. Instead of being in opposition to that kind of learning, the career development process is dependent upon it."

Shinkman, whose thoughts on the importance of career development in the early college years are included in an anthology of writings by leading career development theorists and practitioners from education and business, is a former director of career counseling at Trinity College in Hartford, Conn.

More than 30 practitioners and theorists contributed to *Career Development in the 1980s; Theory and Practice*, (Charles C. Thomas; Springfield, Illinois) a 450-page volume designed both to serve as a text for graduate level counseling programs and to provide material for practitioners of career development activities in higher education, business and other settings like non-profit organizations and government agencies.

Shinkman edited the volume, along with David H. Montross, coordinator of career planning at Holy Cross College in Worcester, Mass.

The development of the ability to understand other people (is) central to the academic mission and particularly to the role of the liberal arts. Instead of being in opposition to that kind of learning, the career development process is dependent upon it.

—Christopher Shinkman

In an article entitled "Career Development in the Early Years," Shinkman asserts that there are several "natural enemies" confronting career counselors in their efforts to reach underclass students.

"Working against the counselor is the warm, comfortable, protective, nurturing (some would say womblike) environment that exists on college campuses, particularly residential ones. . .sensational stories of Ph.D's driving taxicabs or grilling hamburgers for a living tend to increase anxiety and to discourage positive action on the part of students."

Even parents holding unrealistic standards or expectations hinder the work of career counselors, he states.

Shinkman offers 10 suggestions to career planning centers seeking to attract undergraduates soon after they arrive at the college or university. These include; 1) publicizing the center at orientation functions; 2) helping students clarify interests and encourage self-assessments; 3) utilizing resident advisers who, while not trained professionals, "should be trained by the Career Counseling Office staff to be effective sounding boards and sources of information and referral."

Shinkman also encourges 4) peer involvement, by including freshmen and sophomores on student advisory committees to provide input on student perceptions.

Additionally, Shinkman favors 5) integrating faculty and 6) curriculum programs with career planning: "A system of faculty career advisers can be created whereby one or more faculty members from each department or major field of study on campus are designated, preferably with the advice and consent of the department chairman, to serve as a liaison or coordinator between the Career Counseling Office and that department.

"Faculty members are generally jealous of their classroom time. However, some may be inclined to allow career counseling staff members to appear, particularly in social science classes where employment, work satisfaction, leisure pursuits, problems facing women and minorities, etc. are discussed."

Shinkman also lists 7) teaching courses and offering workshops relevant to the needs of young undergraduates—"not resume writing, interviewing, and job search strategy, but rather the content should deal with the prerequisite questions of values, attitudes, goals, interests, aptitudes, and relations between vocational and leisure activities; 8) involving extracurricular activities as part of a value clarification and interest identification process; 9) taking advantage of alumni contacts off campus; and 10) making full use of campus publications to deliver messages to underclass students.

Shinkman acknowledges that, indeed, some disagreement does occur regarding the timing, readiness or maturity of undergraduate students in regard to career counseling, but insists "A thoughtful and systematic exploration of values, interests and skills, combined with an understanding of graduate study, employment options, and work settings, and the ability to make effective decisions, can lead to a positive outcome at the end of the four-year undergraduate period."

Life not primarily choice, but interpretation, James March suggests

Life is not primarily choice, but interpretation.

Such a perspective may help clarify decision-making in human organizations, according to Prof. James G. March of the Stanford Graduate School of Business.

"The reason that people involved in decision-making devote so much time to symbols, myths and rituals is that we care more about them," he declares.

"Decision-makers and organizations gather information and don't use it; ask for more, and ignore it; make decisions first and look for the relevant information afterwords."

Scanning for solutions

But there are several "sensible reasons" why decision-makers deal with information this way:

"First, decision-makers operate in a surveillance mode more than they do in a problem-solving mode.

"Instead of gathering information to resolve a choice among alternatives, decision-makers scan their environment for surprises and solutions. They monitor what's going on.

"Such scanning calls for gathering a great deal of information that appears to be irrelevant to 'decisions.' They characteristically do not 'solve' problems; they apply rules and copy solutions from others.

"Second, decision-makers seem to know, or at least sense, that most information is tainted by the process by which it is generated. . . . Most information is likely to be presented by someone who is trying to persuade a decision-maker to do something. . . . (It) is rarely innocent.

"Third, highly regarded advice is often bad advice. . . . Much highly regarded advice and much generally accepted information is misleading. . . . Decision-makers seem to act in a way that recognizes the limitations of 'good' advice and 'reliable' information.

"Fourth, information is a signal and symbol of competence in decision-making. Gathering and presenting information symbolizes and demonstrates the ability and legitimacy of decision-makers.

"A good decision maker is one who makes decisions in a proper way, who exhibits expertise, and uses generally accepted information. The competition for reputations among decision-makers stimulates the overproduction of information."

Viewed in this light, useful management information systems are:

* "Less tied to the prior specification of a decision or class of decisions than to a wide spectrum of possible decisions, impossible to anticipate in the absence of information;

* Less likely to show the consequences of known alternatives for existing goals than to suggest new alternatives and new objectives;

* Less likely to test old ideas than to provoke new ones; and

* Less pointed toward uncertain futures than toward interpreting ambiguous pasts."

Information management

Such a view of information is "associated classically with literature, art, and education," March says. "To describe information management in such terms is, of course, to glorify it.

"It suggests that office memoranda might be viewed as forms of poetry and staff meetings as forms of theater. We may perhaps wonder whether it would be better to admit a distinction between a sales chart and a Picasso painting—if only to assure that each may achieve its unique qualities.

"Yet the vision has a certain amount of charm in it. At least, it seems possible that with a little imagination, here and there, educational philosophy and literary criticism might be used to help management information systems achieve a useful level of irrelevance."

March's views on "Theories of Choice and the Making of Decisions" recently drafted in text form, were originally given in a public talk at the American Association for Advancement of Science meetings in Washington in January.

Supported by grants from the Spencer Foundation, the Graduate School of Business, and the Hoover Institution, March's research draws heavily from work done jointly with others, including Michael Cohen, Richard Cyert, Martha Feldman, Johan Olsen, Guje Sevon, Zur Shapira, and Herbert Simon "but they should be exempted from blame," he notes.

March holds the endowed Fred H. Merrill professorship in the Graduate School of Business and is a senior fellow at the Hoover Institution. He teaches courses in political science and sociology.

Life insurance? Take another look, name beneficiary

Most Stanford faculty and staff are cheating their beneficiaries!

Stanford has provided $5,000 of free life insurance for each employee, and a family member could receive it within a day or two after the staff or faculty member's death—if he or she has bothered to name a beneficiary.

To date, the majority has not bothered.

Information on the new life insurance plan was mailed around Sept. 1, and it may be reasonable to assume that many people have misplaced the packets by this time.

Those who would like to name a beneficiary or have a second chance to consider the new life insurance options may visit the special office in the Old Pavilion or call ext. 7-0757 between 9 a.m. and 4:30 p.m., including the lunch hour.

The open enrollment period will end Nov. 10, with new coverage becoming effective Dec. 1. The Benefits Office understandably hopes that everyone won't wait until the last minute to do their duty by their beneficiaries.

Free consulting on statistics

Stanford has a new, free statistical consulting service available to any member of the campus community. The Statistics Department now operates a drop-in consulting service run by graduate students under faculty supervision.

All faculty, staff and students on Stanford business are encouraged to stop by for statistical advice at any stage of research. Advice in the early stages of a project is especially encouraged, so that the consultants may be helpful at the design stage.

The service is open from 1-3 p.m. Tuesdays and Wednesdays, and from 10 a.m.-12 p.m. on Fridays. All hours are held in Sequoia Hall, Room 107.

For further questions, call Trevor Hastie at 497-2623, or 497-2620.

Vice presidents adopt SPIRES data base system

Stanford's Vice-Presidents, at a meeting on Sept. 28, approved Ed Shaw's recommendation that Stanford adopt SPIRES as its principal administrative data base management system. Shaw is the associate provost for information technology, and director of the Center for Information Technology.

SPIRES, the Stanford Public Information Retrieval System, was developed at Stanford over the past two decades for managing library automation information and physics data, and was eventually seen to have general data base applicability. It is a data base management system that allows one to create, own, and manage one's own collections of data, known as data bases.

Unlike some data base management systems, SPIRES is very generalized; it is designed to handle all types of data efficiently, from compact, numerical information typical of administrative and scientific data to lengthy, textual information such as bibliographic data.

SPIRES is designed to permit easy access to information. It uses commands in simple English, much as the WYLBUR text editor at CIT does. The user does not have to be a computer programmer or know any other computer language to use SPIRES.

Specially designed SPIRES applications for general use are already well-known in the Stanford community. These are, for instance, EMS (Electronic Message System), EMAS (Expenditure Management and Analysis System), RLIN (Research Libraries Information Network), the procurement system (PRESS), the online stores ordering system, the leave tracking system, and others.

Campus Report's October 6 issue described three other SPIRES supported systems: the online course reservation system, the Medical Record Index System for patient chart control, and the online reserve catalog system in Meyer Library.

The impact of the decision to adopt SPIRES as the administrative data base management system will be seen in the increased demand for training in the use of SPIRES on the part of administrative line officers.

In addition, certain existing non-SPIRES data bases will need to be converted to SPIRES, such as the GRADS system of the Office of Development, which manages information on gifts, records, alumni, donors, and special-interest volunteers. CIT is already in the process of organizing resources to meet these needs.

"The SPIRES choice is a decision in favor of a fourth-generation data base management system," says David Ernst, CIT's director of administrative information systems.

"This means that Stanford line offices will have more and better tools to utilize automated data to support their functions. Also, the Center's Administrative Information Systems division can move toward building systems more suited for use and control by personnel in both administrative and academic departments."

Get football tickets now

Football tickets are still available to all faculty and staff for the Washington and Arizona home games at $12.50 per ticket.

Personnel update

Retiree work program a success story

Both retirees and campus departments have been happy with a program started in July by the Employment section of the Personnel Department.

The program serves departments interested in hiring Stanford retirees to do temporary or part-time work on campus by providing (on request) lists of available retirees and summaries of their experience and qualifications.

While Employment cannot guarantee that qualified retirees will be available to meet all departmental needs, departments which have taken advantage of the program indicate that it has been very helpful to them.

Departments that would like a copy of the list summarizing information regarding the retirees available for work should contact Janelle Sumida at 7-1888. Updated lists will be available by Nov. 15.

Retirees interested in the program should call Sumida, too.

Letters to the editor

A 'hollow victory' for Stanford

Editor, *Campus Report*:

Stanford University may believe it has won a battle against its workers, but it will prove to be a hollow victory.

Its objective was to undermine and break United Stanford Workers' union in order to prevent its expansion to hospital workers who are soon to vote in an election. As with office and clerical workers, in last year's election, it gave increases to hospital workers above those offered to unionized workers.

For its purpose, it had to demonstrate its power over workers by refusing to meet and negotiate a contract acceptable to union workers. Its hard inflexible policy left many issues important to workers unresolved.

Union members return to work with bitterness, anger and resentment against the university. Gone is any vestige of illusion that Stanford cares about those who serve it. Stanford's anti-union tactics are on a par with the largest union busting corporations in the country.

The union has won notable achievements in the past which benefited nonunionized workers. Obviously just the threat of unionization brought substantial increases to university office workers as well as hospital workers. Everyone, including faculty, benefited by increases in medical benefits for dependents, the dental plan, pension, etc., won by the union previously. But Stanford remains far below the benefits given workers by the large industrial corporations of the area.

Despite extreme financial hardship, the union members held fast for four long weeks before being forced back to work without conditions vital to their welfare. But the union, United Stanford Workers, Local 715 of the Service Employees International Union, remains intact. It will consolidate and build its organizational forces to meet and overcome the overwhelming economic power of the university.

Organized labor, which helped bring us the eight-hour day, the right to collective bargaining, unemployment insurance, social security, and medicare will continue to build its power in order to extend economic democracy to all people.

Retired staff

Visiting scholar doubts 'spy story'

Editor, *Campus Report*:

As a visiting scholar who has recently arrived at Stanford from the Republic of China, I was shocked by a story published in the *Campus Report* on October 6 under the headline "Goheen says Taiwanese spy on students."

Having been a resident in Taiwan for 35 years, I know only too well that the government of the Republic of China has been quite politically tolerant and especially that the government, in face of the threat from Communist China, has exerted itself to befriending overseas Chinese, including American-educated students. My impression has been confirmed by my personal interviews of some leading political figures in the government of Taiwan.

All the more indicative of the political atmosphere of the ROC is the presence of at least 10 dissent journals in Taiwan and the growing voice of politicians opposing the ruling Nationalist Party. These political figures, despite their harsh criticism of the government, claimed the mayorship of four cities in Taiwan last year.

It is therefore beyond my imagination that students here will be persecuted simply because they hold views different from those in power. Those who embrace the spy story without second thought should learn the ABCs of my country.

Being suspicious of the validity of the report by Goheen, I arranged an interview with Professor Goheen and to my disappointment failed to obtain any evidences which could convince myself of the truthfulness of the spy story. In an attempt to do my own checking, I talked with 10 students from Taiwan, none of whom are aware of the alleged spying activities.

I personally believe that radical groups who have sabotaged the Republic of China engineered the plot to tarnish the image of my country. Their purpose is threefold. First, they attempt to estrange the Chinese students from their government and build up their own strength. Second, they attempt to tarnish the image of the Republic of China and thus make Americans hostile to the government of Taiwan. Third, they attempt to affect the policy toward the ROC.

There are two sides to a coin. I sincerely appreciate your effort to show your readers the other side of the spy story, which Goheen failed to reveal.

American Studies has a 'Jewish mother' from Calcutta

All they wanted was a chef, but they also got a Jewish mother.

Now, as just about everyone knows, Jewish mothers are universal figures, coming in all sizes, shapes, and colors. (Some even are male.)

This particular one, now the resident chef at American Studies House, happened to be born in Calcutta and has spent the past 23 years as a psychotherapist.

The switch from professional counseling to professional cooking was not that much of a jolt, because 60 young people living together in almost any Stanford residence always are delighted to have someone there who resembles mother, who won't make them feel guilty, and who knows how to listen.

It was pure chance that brought Juthica Stangl together with 60 students in American Studies House.

"I was thinking of changing my life, doing something different," she says. "I suppose you could call it a mid-life crisis, except it wasn't any kind of a crisis. But I didn't want to go back to school or retrain myself. Then I thought, wouldn't it be fun to capitalize on something I enjoy?"

Superb cook

Stangl's friends knew what a superb cook she is, and one asked her, just a year ago, if she would cater an office party. "Certainly," she replied. "How many people?" She gulped when the response was "200,' but the party was a big success and she since has developed a catering business.

Then last spring she saw a newspaper ad: American Studies House needed a chef.

"I phoned my husband to say I intended to apply, and he said, 'Cooking for 60 people? Are you cracking up?' "

Although her first tryout meal involved recipes from her native India and drew mixed reviews, she was hired and her first regular meal was beef stew, peas, noodles and home-made chocolate cake. It was a success, and at the end of spring quarter she was hired permanently.

But when she was growing up in Calcutta, she never cooked; servants were hired for that job. Her goal was to work in villages and "save the world."

Her father, an engineer, was remarkable for his time: he didn't discriminate against girls, and valued education. "If I give you money, you could just blow it, but an education is something you'll have forever," he told his seven children.

Juthica Stangl

All seven graduated from college, and four earned graduate degrees.

Juthica earned her master's degree at University of Delhi's School of Social Work, and at age 21 was named director of a YWCA center in a village, where she ran a training program, nursery school, clinic, adult education classes, and raised money.

After a year at University of Toronto, she went to Yale, where over several years, she completed all work but a dissertation toward a Ph.D. For three years, she worked in black and Puerto Rican ghettos in a New Haven community program.

"I had a sense of accomplishment, but it was so frustrating because of the red tape," she says. She adds that having brown skin was helpful: "There was constant conflict between black, white, and Puerto Rican residents, but somehow they could relate to me because I was brown."

She also worked at Yale's Mental Health Center as a psychotherapist, mainly with drug addicts, and ran groups for adolescents.

Eleven years ago she, her husband, and their two children came to Stanford (Peter Stangl is director of the Lane Library at the Stanford Medical School). She began working for the Family Service Agency (where she also had worked at New Haven) and eventually increased her participation to 30 hours a week, plus having a private practice.

Now she prepares lunches and dinners Sunday through Thursday at American Studies House, and gets home on working nights about 6:30 p.m. in time to have dinner with her family (her husband is an expert cook, too.)

International dishes

"I try occasionally to do different international dishes, and hope they learn to like them," she says. "One student complained once and said he preferred hamburgers. I told him, 'Some day you'll be president of a company, maybe president of the United States, and when you go out you won't want to order a hamburger.'

"I can't stand wasting food—I still have images of famines in India. So I talk with the students about taking only what they want, and coming back for seconds.

"I love these kids. They're bright, motivated, and kind, and always asking, 'Is there anything we can do to help?' They built me a stool, because I'm so short, only 4'11" and they help lift the big pans and pots."

All the students take turns working in the kitchen and dining room, so they soon found out about Stangl's professional background.

"She is working out unusually well," says Resident Fellow Jay Fliegelman, an associate professor of English. "She is a very good listener, youthful (she is 49), and current. When we were interviewing applicants for the job of chef, we looked for an experienced and dependable cook. We got that and much more in Juthica Stangl."

Suzanne Smith, a sophomore living in American Studies, says "Food Service in dorms is okay, but there's just no comparison with Juthica's cooking. And she's very nice to talk to."

"I'm really high and very happy with this job," says Stangl, who also has time for dancing classes and for work as a volunteer at Bechtel International Center. She has had all the students in her home twice for informal barbecues, plus a special cocktail party last June for graduating seniors and their parents. She still remembers what one parent told her:

"You make a difference in my child's life."

—Harry Press

Despite financial difficulties, ASSU Recycling continues its rounds

Despite financial difficulties, ASSU Recycling will continue to collect paper, glass, aluminum, and cardboard from all student residence and administrative buildings.

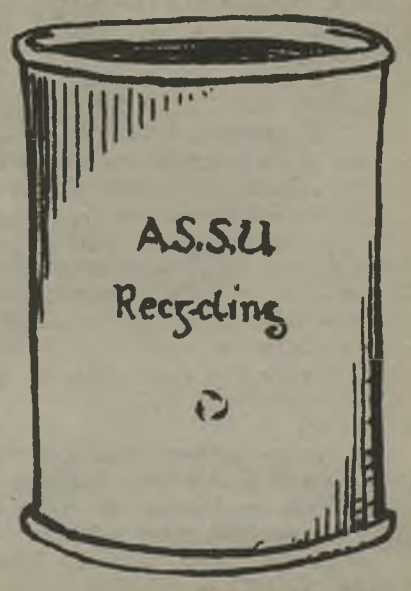
In order to reduce staff sorting time, the operation has discontinued collection of mixed paper from student residences. This year only newspapers, bottles, aluminum cans, and cardboard will be collected there.

All office programs remain unaffected. (A recent photo caption in *The Daily* mistakenly reported that newspaper was the only material which the ASSU would accept.)

The student-run recycling group was hard hit by the recession. Paper prices tumbled as much as 66 percent, while the price of aluminum fell by 30 percent. The decline in revenues was largely responsible for recycling's worst-ever loss of $18,000, despite a 9 percent increase in volume recycled to more than 700 tons per year.

Project comanager Leslie Young remarked that recycling is mistakenly evaluated as a profit-making business, rather than as a service to the community: "We take away the trash for less than half the unit cost of the university garbage service, and we don't even throw it away!"

The perennial deficit of the recycling service has been covered in the past by the student government. Last year's record loss and tight budget has forced the ASSU to examine its support for the organization. An ASSU senate spokesperson said that no draconian changes in the operation were under consideration at the present time.



"Our worst problem right now," said manager Young, "is our usual autumn quarter task of educating thousands of new students about our program, while still providing consistent services to administrative offices."

Young said that the financial difficulties could be overcome if the Stanford community recycled more conscientiously: "Give us all your paper, but please—not your trash."

Electrical Engineering: the entrepreneurial connection...

The line running between Stanford's Department of Electrical Engineering and the entrepreneurs of Silicon Valley is a long one. Companies such as Hewlett-Packard, Varian Associates, Fairchild Camera and Instrument, and Shockley Transistor all were associated with Stanford "Double E" alumni and professors.

Those companies were founded decades ago, leaving a void when they expanded. That void is being filled by a new generation of Stanford entrepreneurial talent.

MicroSensor Technology is one of the youngest members of this generation. Having been financed by a combination of private and venture capital just this year, the relatively informal Fremont, California headquarters betrays MST's youth.

There is no security guard at the front door, but an open reception area instead. The thirteen employees are dwarfed by the 36,000 square feet of space. The extra room doesn't appear to bother anyone, least of all Steve Terry, the chief technology officer and cofounder. As he cheerfully explains, while pouring his own cup of coffee, "This gives us room to expand."

Terry has reason to be optimistic about the future of MST. Makers of a computerized gas analysis instrument, MST has already sold 12 units even before production began. At current price estimates of $20,000 apiece, Terry's projection of 250 employees in two to three years seems conservative.

The idea that started MST was conceived at Stanford, where Terry and two of MST's other founders, Soheil Sadat and Hal Jerman, were working toward their doctorates in electrical engineering. As part of a research grant from NASA, Terry was developing a capillary column tube in silicon. However, he needed components such as valves, tubes, and a gastrograph. The work culminated in a device called a gastromatograph, capable of making a gas analysis almost instantly.

Other gas analysis instruments have been around for a while, but MST's innovative advantage is its size. Because it functions on a silicon wafer, it can be placed into a component that is a fraction of the formerly oven-sized unit. Currently the dimensions of a small portable TV, MST hopes to produce a pocket-sized version soon.

First prototype

The first working prototype was produced in the Stanford labs in 1980. By the following year, when five additional prototypes were produced, Terry and Jerman were convinced of the gastromatograph's marketability. A local optics firm, looking to diversify, saw potential in the first few samples. Two men from the optics firm joined the three Stanford engineers, bringing capital and marketing expertise. With the addition of a chemist from Hewlett-Packard, the six incorporated MST in early 1981.

Terry readily acknowledges Stanford's role in encouraging innovative technologies, like the one that founded MST.

"As IC design has developed, Stanford has kept pace. It's a real advantage to have Stanford nearby. There are the contacts with the IC lab, the library, and in the future, contacts for future employees.

Terry saw an advantage when he was a graduate student too. "When a piece of equipment was broken, there was always somewhere to go, someone willing to lend their facilities."

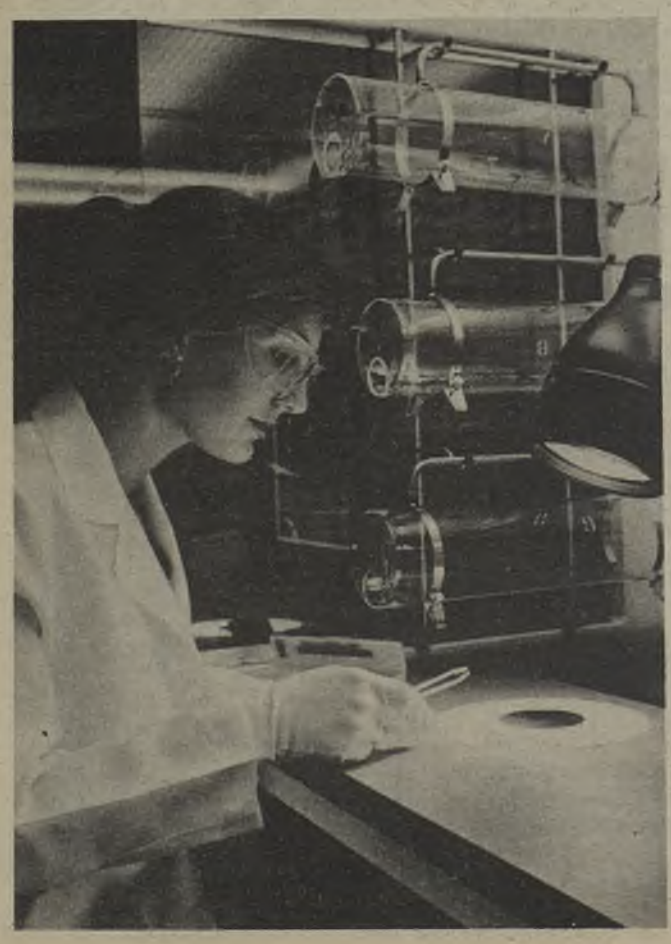
Jim Clark, associate professor in electrical engineering, at Stanford, agrees that the proximity of the University to Silicon Valley is a boon to the industry. "The students are brilliant here," says Clark. "In industry you don't tend to run into that kind of fresh, fertile attitude, people open to trying new things regardless of what their past experience tells them they can or cannot do. I guess it's just the openness of this environment, of trying new things."

According to Clark, the University benefits just as much from this synergistic relationship.

"It's the fact that you have creative people, who by virtue of the fact that they're pushing state of the art in an industrial business sense, they create opportunities for students. In addition, they bring ideas.

"There are a lot of things that I, by wanting to get this design working, have learned by talking to people in industry and just learning the tricks of the trade. And we share those tricks of the trade with the community here. There's a cross-fertilization."

Clark is speaking from first-hand experience; he is founder of Silicon Graphics. Manufacturers of the Iris work station which produce high-speed, high-resolution graphics, the company utilizes an innovative technology called the Geometry Engine. It is a silicon chip with built-in graphics ability, enabling it to perform such tasks as taking a three-dimensional object and rotating it dynamically every 1/30th seconds. Actually 12 chips in a series, the Geometry Engine performs such as color, high speed, high resolution computer graphics 48 times faster than a general chip, and eliminates much of the need to write lengthy programs.



Although the prototype is playful—the screen shows Snoopy in his World War II Flying Ace outfit twirling around—the applications are practical and wide-ranging.

"All sorts of people will use the system composed of this chip, architects, computer science majors and engineers—industrial, civil. It's especially great for electrical engineers, designing integrated circuits, transistors, and so forth," says Clark.

Like MST, Silicon Graphics is young. It incorporated in November, 1981, and received the first round of financing in late June, 1982. The company is similarly optimistic about the future: their customers already include three of the top computer companies in the world and their business plan reveals a goal of sales in excess of $100 million within five years.

Has this sudden success interrupted any long-term teaching plans? "There were certainly many years that I wanted to be a

Lab technician studies silicon chip.

New computer graphics generates

The one thing computers can do better than humans is manipulate large amounts of data at high speed. But people are better at looking at patterns and relationships in that data.

A group of mathematicians and computer scientists at the Stanford Linear Accelerator Center (SLAC) have devised a computer graphics system that takes advantage of the abilities of both systems, the human and the computer, in a way that permits statisticians to see things in statistics they could never see before.

The result is not only useful, it is quite beautiful.

Clouds of data points, in a myriad of colors, twist, turn, and swarm across a dark screen. Even nonexperts can find patterns in the clusters that would not be obvious to a trained statistician looking at standard scattergraphs and cross-tabulations.

The computer hardware is modified off-the-shelf equipment; the software is unique.

"The idea is to graphically display the data so that the patterns in the data appear as geometrical entities in 'point clouds' as opposed to just a series of numbers, says Prof. Jerome Friedman, who has a joint appointment at SLAC and Stanford's Department of Statistics. "You use the human gift for perception and pattern recognition."

The genesis of the system goes back 10 years when Princeton statistician John Tukey, working on a sabbatical at SLAC, investigated the use of computer graphics for statistics. Along with SLAC's Mary Ann Fisherkeller, Tukey developed PRIM-9 for the graphical display of statistical data.

It was very expensive and used only black-and-white graphics which limited its uses. Nonetheless, because the data points were in motion, the clusters appeared to be three-dimensional. This enabled human observers to see previously-hidden patterns in the data. One researcher at the Palo Alto Veterans Administration Hospital used the technique for a study on diabetes.

A year and a half ago Friedman and Werner Stuetzle, of SLAC and the Stanford Statistics Department, began working on a new system, making use of some of the techniques and hardware developed since Tukey's work.

"We've made extensive use of microprocessor technology which didn't exist before," Friedman says. "Before, we were connected to a very large mainframe computer, and you had to have an expensive fast link to that computer.

"Now. . .we do it basically in a stand-alone work station. All the requisite computer power is right there. We can devote a much larger amount of computer power to the user and do things that we couldn't do before."

The main microprocessor technology was developed at SLAC by Paul Kunz who used it to analyze particle physics data.

Most of the software was written in PASCAL by a graduate student, John McDonald, as his Ph.D. thesis.

The program and data are still housed in SLAC's IBM 3081 main frame, but the actual processing takes place on what looks like jerry-rigged equipment on a table in a room next to the terminal.

Friedman, McDonald, and Stuetzle are using 1970 census from Boston as a test.

"It's not being used for anything of a serious nature yet. . ." he explains. "The reason is that it's still very new. We've been developing the hardware, the software, the methodologies."

The data they are using concerns housing patterns in the Boston Metropolitan Statistical Area—the city and its suburbs.

All 506 observations for a certain variable—for instance the value of the houses—are put on the screen and combined with another variable such as crime rate forming a two-dimensional point cloud. McDonald can then add a third variable to the screen—the number of rooms in each house extending the cloud to three dimensions.

Relationship benefits all concerned, particularly students

continued from page 8

normal, just ordinary professor teaching and so forth," Clark admits, "but I suppose I recognized that my style of work is one of carrying things from concept and idea all the way to some form of embodiment or implementation, and the pressures of the academic world really require that you stop somewhere along the way in that course, and let someone else or something else take care of reducing it to an embodiment.

"I enjoy getting a lot of very state of the art research done, and somehow those things seem to conflict. If the demands of one place or the other are such that they are incompatible, then I'd probably leave Stanford."

That choice faced Roger Melen six years ago; his decision was the same, and the result is Cromemco, Inc., manufacturers of microcomputers. "It seemed to be the thing to do," says the Stanford Ph.D. and vice-president.

Unambiguously successful, and a role model for younger entrepreneurs, Cromemco has accumulated some impressive statistics. Claiming to be the world's biggest manufacturer of the sophisticated S-100-based microcomputers (40 percent of the market share), the company's 195,000 square foot, 27-acre Mountain View facility generated more than $50 million in revenues in fiscal year 1981. *Inc.* magazine has estimated Cromemco's past rate of growth at 216 percent annually.

The office headquarters live up to the statistics. In contrast to the informality at MST, Cromemco's reception area has yielded to the conventions of the business world. All visitors must sign in and receive a numbered visitor pass. On the door there is a sign acknowledging the realities of the easily-smuggled product: "Notice: All packages, including briefcases, toolboxes, ARE SUBJECT TO INSPECTION before being removed from the building. Your consent to such inspection is given by entering facility."

The only evidence of Cromemco's humble origins is the name, which is a compression of Crothers Memorial Hall, the name of the Stanford dorm where it all started.

Melen and co-founder (now president) Harry Garland, having received their doctorates from Stanford in 1972 (Melen's was in electrical engineering; Garland's was in biophysics with a minor in engineering), were part of the University faculty. They used their salaries to finance the production of small computers, adapting the S-100 bus to modular "add-on" circuit cards of their own design.

The operation was, quite literally, "home-grown": the research lab was a room in Melen's apartment; the production facility, Garland's garage.

Only half-facetiously does Melen suggest that the California climate is responsible for the growth of the computer industry, saying, "When so many entrepreneurs start out, literally in garages, as we did, it's no wonder that there are more companies out here than at Route 128 (near MIT in Massachusetts). When you only have half a year," he smiles, "It could restrict you."

Best in their field

Melen cites Stanford as a catalyst of industrial innovation. "Stanford's role is that of a major world-class University," says Melen. "Its purpose is to train highly talented individuals to be more productive in their chosen profession."

There is, in fact, a need to have a good relationship between the industry and the University because meeting the needs of an industry based on innovation and meeting the needs of a University committed to training individuals to be the best in their fields is "difficult unless teaching is profession-relevant."

Melen continues, "Stanford is unique in that it is a hotbed of entrepreneurial activity. It has a unique cross-section of the population, a long-history of hands-off, laissez-faire attitude to entrepreneurship, no directly stifling policies, a large engineering and scientific program from which these groups come.

Does Melen see any conflict of interest? "The system's not perfect yet, but it's the best we have. There are greater abuses in the welfare system."

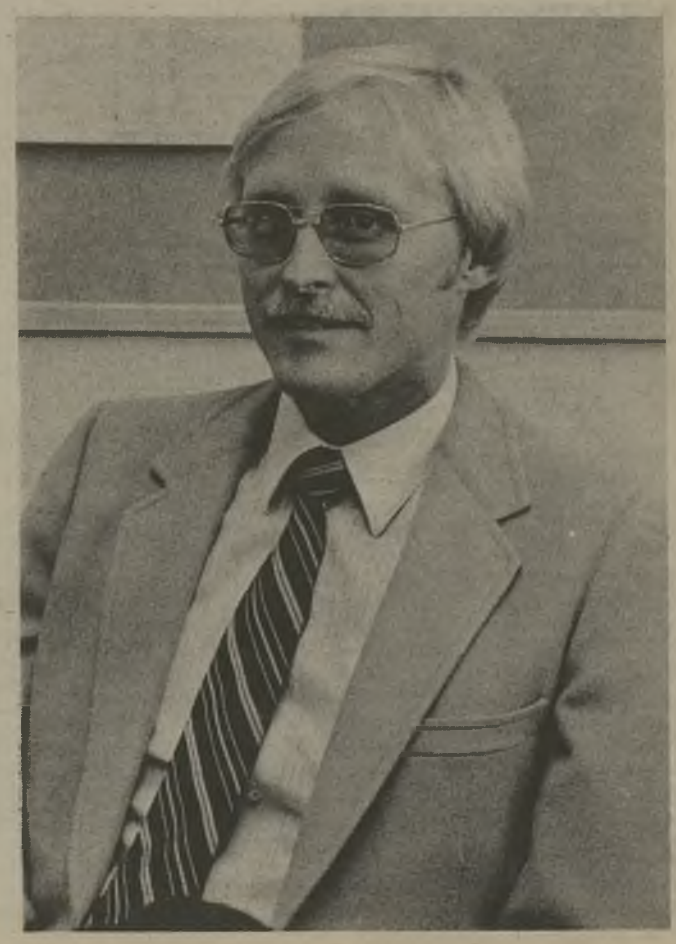
These new engineering firms are financially independent.

Clark elaborates: "Stanford has a nice lenient policy (on patents). If you're simply an employee at Stanford, there's a policy that the inventor owns the invention."

When asked if that was different than most universities, Clark responded, "Quite different. It's one of their calling cards.

"One of the nice things about Stanford is that they can attract people who can use that. In the end, Hewlett-Packard, or Varian, or Rolm, or name any company, decides to donate a building. I think in the end it all balances out. It's a way of having a certain amount of trust that by being lenient, or versatile, in a policy, they encourage people to be inventive here. That just might not happen elsewhere."

In all of this, there is an enormous "windfall" to the student, in the form of lucrative, state of the art jobs. Cromemco counts approximately 20 percent of its technical staff from Stanford. A few engineers do come from Berkeley, but "somehow a lot fewer," winks Melen.



Although presently both MST and Silicon Graphics are too small to be expanding their staffs, they look to Stanford graduates as a natural source of manpower in the future.

"I came from this environment, so students who have worked with me, or have been real excited about it—there's some of them who are going to join us," says Clark. And importantly, both Clark and Melen are making every effort to maintain close ties to the University.

Melen, although no longer a full associate professor at Stanford, does teach a class every winter quarter. Appropriately titled, "The Entrepreneurial Engineer," it is a popular series of seminars led by different Silicon Valley entrepreneurs.

He teaches it as a service to the students of Stanford, as well as to expose to interested students that special spark of entrepreneurship.

—Amy Bernhard

It's the fact that you have creative people...they create opportunities for students. In addition they bring ideas.

—James Clark

lovely, clouds of data for statisticians

Each variable can be given a different color (the computer can produce 256 colors.) Using a tracker-ball, McDonald can make the cluster of data points rotate in three-dimensions.

"You can see the points in three dimensions although you are never looking at anything but a two-dimensional picture. . .the reason you see it in three dimensions is the paralax effect. Because of the apparent continuous motion, your brain has no trouble connecting points," Friedman explains.

The way the points for the three variables cluster can tell statisticians many things. But when the points are rotated in their positions relative to each other, new patterns and relationships are obvious to the human eye and brain.

The computer can identify each data point in the same way a flight controller can identify aircraft on his radar screen. In this case McDonald rotates the tracker-ball and an X appears on the screen, and moves around, identifying census tract numbers as it goes.

The screen can spot Beacon Hill and the Back Bay, affluent areas in the heart of the city surrounded by slums. By adding the variable of air pollution it is easy to see that pollution is high although, unlike other parts of the city, it does not seem to affect property values very much.

A trained statistician may have spotted this using conventional methods, but the SLAC technique can go farther. Colors can be assigned values, and then those colors can be kept as new variables are added and the "clouds" are rotated.

Researchers can even split the screens to handle around 12 or 14 different variables. They can set a certain parameter in the data and then have the computer, using hues of color, tell how far the data point is from the parameter.

"Another way to see connections between the 14 variables at once is to try to make connections between a sequence of plots, or to somehow relate structures you see in one picture with another picture," McDonald says. The computer, using color, motion, and the split screens makes that possible.

The device could open a whole new field of statistical analysis, Friedman says.

"Most classical statistics was developed in the 1930s and 1940s, and it was intended for smaller data sets, 10, 20, 30 observations. There, the primary importance of such small data sets is, is your result significant? Is there anything there at all?

"Usually with data sets of 500 or 1,000 or more, that's not the question. The question is usually, what is going on, not is there something going on."

"My guess is," McDonald adds, "in this like everything else, you have to gain experience. After you've looked at a lot of data you begin to figure out what patterns tend to be flukes and what patterns tend to be real."

So far outside researchers have used the system (which does not have a name) but it is difficult to operate.

It is not what computer people call "user friendly."

"So far we've concentrated in the beginning on developing the methodology. . . . We have not concentrated on the human engineering aspect, how do you make that comfortable and easy to do for a researcher, which is very important," Friedman says.

"People who do come up with data. . .sort of work with us in the sense we have to look over their shoulder and help guide them."

The hardware costs about $40,000 but it is possible to put together a system for about half that hardware cost that will do most of what the SLAC system does.

Friedman thinks the software may be in the public domain. There have been no thoughts to commercially distributing the system, he says.

Funds for the research have come from SLAC, the Office of Naval Research, the Army Research Office and the Department of Energy's Applied Math Sciences Department.

—Joel Shurkin

Lieberman reviews panoply of restrictions on research

Following are remarks by Vice Provost Gerald Lieberman on "Barriers to the Exchange of Information" given Oct. 5 to the Association of Graduate Schools:

I welcome this opportunity to speak to my colleagues about a most important issue facing American colleges and universities today—that is, recent actions by the federal government to apply export restrictions to university research and scholarly activities. I'd like to begin by describing the two relevant Federal Acts and their corresponding regulations and the problems they pose for the future progress of American science and technology.

The American system of peacetime export controls in roughly its current form dates from 1949. The system includes controls administered by numerous agencies under many statutes, but the two most broadly applicable sets of laws and regulations are the Arms Export Control Act and its associated International Traffic in Arms Regulations (ITAR), and the Export Administration Act with its associated Export Administration Regulations (EAR).

The Arms Export Control Act authorizes the President to control the export of any items he designates as "defense articles and services." Those items so designated constitute the "U.S. Munitions List," and their export is permitted only with a license issued by the Department of State. The term "defense articles and services" includes technical data that can be "used, or be adapted for use, in the design, production, manufacture, or reconstruction of items on the U.S. Munitions List." "Technical data" also includes a vague category of "technology which advances the state-of-the art or establishes a new art in an area of significant military applicability in the United States." The International Traffic in Arms Regulations, or ITAR, implements the Arms Export Control Act. ITAR defines "export," as it pertass by any foreigner, here or abroad, via oral, visual or documentary any items on the U.S. Munitions List, as, "accemeans." ITAR regulations specifically exempts from control any "technical data" which is published or is otherwise freely available. Clearly, he original intention of ITAR regulations was focused on hardware ather than "know how."

The second major federal Act is called the **Export Administration Act,** which authorizes the President to control the export of goods and technical data for three purposes: 1) to protect the national security, 2) to protect goods in short supply, and 3) to further foreign policy objectives. The Export Administration Regulations, or EAR, which implements this Act, restricts export of, among other things, goods and technology which "would make a significant contribution to the military potential of _____ other countries which would prove detrimental to the U.S. national security."

The EAR contains a "commodity Control List" of items restricted for export. This List includes a category called "critical technologies." However, precisely what constitutes a "critical technology" is unknown to those without a security clearance because the government is afraid that a detailed list in itself would provide our adversaries with a "blueprint" of what our Defense Department considers critical, thereby permitting the enemy to focus their research and espionage efforts in those areas. Indeed this is a Catch 22.

EAR restrictions explained

EAR specifically does not restrict 1) data generally available to the public; 2) dissemination of scientific or educational data which is not "directly and significantly related to the design, production, or utilization in industrial processes," or 3) instruction in academic institutions and academic laboratories, EXCEPT information that involves "research under contract related directly and significantly to the design, production, or utilization in industrial processes." Thus, as is suggested by the above, the EAR restricts export of not only military technology, but also some goods and services which may have non-military commercial use. EAR also differs from ITAR in that it specifies which countries may have access to which technology.

I think it is fair to say that both the EAR and ITAR are poorly written regulations. Many of the terms are overbroad with definitions unclear and open to interpretation. They fail to give clear notice as to what precisely is to be controlled, although traditionally specific goods or hardware were the objects of concern.

In the past universities were blissfully unaware of export regulations and their problems since no attempts had ever been made to restrict unclassified university research activities. Then, about two years ago, the Departments of State and Commerce began to expand the traditional interpretations of the export regulations, shifting from their concentation on specific goods or hardware to the control of dissemination of technology or "know how." This was done without any change in the wording of either the Export Control Acts or their regulations or without any evidence of "technology leaks" from American universities to our adversaries. There may be several reasons for this shift. First, efforts by the Russians to obtain, both covertly and openly, US technology have become well known. Also, commercial competition from Japan, Germany, and other industrialized countries has diminished America's leading edge in technology advances, thereby contributing to our economic problems. With the challenge on this nation's military and commercial comptetive positions, there has been a growing tendency of the government to try to restrict the flow of critical technology at all levels.

Let me now outline a series of interactions between the government and universites which highlight the seriousness of the problem. In the fall of 1980, the Defense Department tried to insist on language in selected DOD-sponsored research agreements at universities which would give DOD the right to censor technical reports before they could be published. Most universities reacted by refusing to accept such awards.

About the same time, the Department of Defense issued a directive which said that certain DOD-sponsored unclassified research results dealing with the utilization of Very High Speed Integrated Circuits (VHSIC) could not be published nor be presented at meetings or open symposia. Using ITAR as their justification, Defense informed selected faculty at various universities that both the interim and final technical reports of DOD-sponsored research dealing with the utilization of VSHIC technology were subject to prior DOD approval before they could be disseminated, even though such a requirement did not appear in the provisions of the governing research agreements. Further, DOD required security clearances of personnel attending selected DOD-sponsored conferences at which unclassified university VSHIC research results were to be presented.

Again, at the same time, the Department of Commerce, which is responsible for implementing the EAR, began to send letters to various universities regarding proposed visits to those campuses of specified foreign scholars from communist countries. Commerce told the universities that they were responsible for restricting the visitors' access to certain (undefined) technology which was "highly sophisticated, proprietary to specific companies and capable of potential military application." Further, the universities were instructed that they were responsible for monitoring the visitors' activities both on and off campus. The host faculty were asked to fill out questionnaires describing the scope of the visitors' access to research projects and the "specific results of the visitor's study.

Unwarranted restrictions by DOD

Here have been numerous attempts by government agencies, particularly the DOD, to place unwarranted restrictions on government contracts and grants. In fact, the problem became so acute that on May 21, James Wade, Jr., Deputy Undersecretary for Research and Engineeringin the DOD, issued a memorandum which said Contract Officers should "avoid new or unnecessary restrictions added to university research contracts." He indicated that restrictions should not be placed on publications of basic research results or on the involvement of foreign nationals in unclassified basic research.

The likely long-term consequences of the Government's application of ITAR and EAR to scientific exchanges are dire indeed. First, restricting the free flow of information among scientists and engineers will alter fundamentally the system that produced the scientific and technology lead that the government is now trying to protect. Such restrictions will leave us with nothing to protect in the very near future. The way to protect that lead is to make sure that the country's best talent is encouraged to work in the relevant areas, not to try to build a wall around past discoveries. The restrictions represent the worst possible direction: they fail to protect the status quo and virtually guarantee that there will be no future.

A second problem for universities posed by such restrictions is a practical one: it would be virtually impossible for most of us to administer such restrictions given the necessarily decentralized and fluid nature of most campuses. Because it is so inconsistent with their character, universities are neither structured nor staffed to police the flow of scientific visitors to a given laboratory or the dissemination of information by their faculty at international conferences, or indeed even in an American campus classroom where foreign students happen to be present.

A third kind of problem which would result from application of the export controls to scholarly activities is the chaos and uncertainty posed by the nonspecific and all-encompassing wording of the regulations. For example, the implication in the wording of the EAR is that any research which is "directly and significantly related to the design, production, or utilization in industrial processes" is subject to restriction. That could apply to the entire research of schools of engineering.

The concern of universities should not be simply that of academic freedom, although I must say that the restictions as currently interpreted by many federal officials do raise serious questions of Constitutionality with respect to freedom of speech. But the most critical problem in this whole issue is the inevitable damage to the fundamental process of science itself and to the development of new technology, which would result from application of EAR and ITAR to scholarly pursuits and exchanges.

Universities have appealed to the government to work jointly with federal officials in developing alternative measures to best serve the interests of American economic development and security without jeopordizing the progress of science. I am happy to report that the government has responded to this offer: a Forum has been formed under the leadership of DOD's Undersecretary Richard Delauer and Stanford's President Donald Kennedy to study university - DOD relations. A sub group of this Task Force, of which I am a member, is specifically studying the issue of export controls. This Task Force, composed of government and university representatives, has already met several times. Most of the meetings have been of a fact-finding nature, and has served to inform each side of the problems the other faces. The last meeting took place on Thursday, October 7, 1982 when the main topic for discussion was the Report of the National Academy of Science Panel on Scientific Communication and National Security which was released on Thursday, September 30th. At the same time that the Forum was established, Frank Press organized a Panel consisting of 19 distinguished scientists with experience in industry, universities, and government to study the problems of export controls.

NAS panel conclusions

The panel concluded that there has been substantial and serious leaking of American technology to the Soviet Union, but concluded that open scientific communications and exchanges, particularly the activities of universities, played "a very small part" in the leakage. The Panel made several recommendations concerning the control of university research activities, which can be grouped into three categories: 1) restricted areas of research, 2) classification and 3) gray areas.

1) Unrestricted Areas of Research: "The Panel recommends that no restrictions of any kind limiting access or communication should be applied to any area of university research, be it basic or applied, unbless it involves a technology meeting ALL of the following criteria:

a. The technology is developing rapidly, and the time from basic science to application is short;

b. The technology has identifiable direct military applications; or it is dual-use and involves process or productionrelated techniques;

c. Transfer of the technology would give the U.S.S.R. a significant near-term military advantage; and

d. The United States is the only source of information about the technology, or other friendly nations that could also be the source have control systems as secure as ours. "All of these criteria are important, but whether or not a technology meets these criteria is subjective, and universities may find themselves in constant disagreement with the government.

2) Classification: " The Panel recommends that if government-supported research demonstrably will lead to military products in a short time, classifications should be considered. It should be noted that most universities will not undertake classified work, and some will undertake it only in off-campus facilities." This is a very reasonable recommendation together with an important warning.

3) Gray Areas: "The Panel recommends that in the limited number of instances in which all of the above four criteria are met but in which classification is unwarranted, the values of open science can be preserved and the needs of government can be met by WRITTEN AGREEMENTS no more restrictive than the following:

a. Prohibition of direct participation in government-supported research projects by nationals of designated foreign countries, with no attempt made to limit physical access to university space or facilities or enrollment in any classroom course of study. Moreover, where such prohibition has been imposed by visa or contractually agreed upon, it is not inappropriate for government-university contracts to permit the government to ask a university to report those instances coming to the university's attention in which the stipulated foreign nationals seek participation in any such activities, however supported. It is recognized that some universities will regard such reporting requests as objectionable. Such requests, however, should not require surveillance or monitoring of foreign nationals by the universities.

b. Submission of stipulated manuscripts simultaneously to the publisher and to the federal agency contract officer, with the federal agency then having 60 days to seek modifications in the manuscript. The review period is not intended to give the government the power to order changes: The right and freedom to publish remain with the university, as they do with all unclassified research. This does not, of course, detract from the government's ultimate power to classify in accordance with law any research it has supported.

Recording restrictions

The Panel recommends that in cases where the government places such restrictions on scientific communication through contracts or other written agreements, it should be obligated to record and tabulate the instances of those restrictions on a regular basis. The provisions of EAR and ITAR should not be invoked to deal with gray areas in government-funded university research."

I do not see any serious problem with the restriction on publication but are universities prepared to accept a "prohibition of direct participation in government supported research projects by nationals of designated foreign countries,"? At the same time the Panel recommends that "the process of ITAR and EAR should not be invoked to deal with gray areas in government-funded university research." Is this a reasonable trade-off? Is the carrot worth the stick? This is an issue over which we all will have to begin a dialogue on our campuses. In general, the National Academy report is a thoughtful document which attempts to balance the concerns of universities and the federal government.

Computer scientist Yao joins faculty; mathematician Caffarelli due in 1983

Prof. Andrew C. Yao, computer scientist at the University of California at Berkeley, and Prof. Luis Caffarelli of the Courant Institute of Mathematical Sciences at New York University have been appointed to the Stanford faculty.

Final action was taken by the Board of Trustees Tuesday, Oct. 12.

A world leader in the application of mathematics to the study of computer models, Yao was named professor at Berkeley last year. He was an assistant professor at Stanford during 1976-81. His new appointment became effective Oct. 1.

Caffarelli's research has been concerned largely with problems of regularity or smoothness that arise naturally in the mathematical description of physical phenomena—such as the boundary between a jet stream and surrounding still air or the interface between melting ice and surrounding water as a function of time.

Born Dec. 8, 1948, in Buenos Aires, Argentina, he received his Ph.D. from the Universidad de Buenos Aires in 1972. The following year he became a postdoctoral fellow at the University of Minnesota, where he rose through the ranks to become a full professor in 1977. He went to NYU in 1980 and will join the Stanford faculty Sept. 1, 1983.

His most recent major publications include "A Problem in the Calculus of Variations with a Free Boundary" (1982) and "Compactness Methods in Free Boundary Problems" (1981).

Yao, the author of approximately 50 technical publications, was born Dec. 24, 1946, in Shanghai, China. He received his bachelor's degree at National Taiwan University in 1967, then a master's and doctorate in physics at Harvard in 1969 and 1972. He then obtained a Ph.D. in computer science at the University of Illinois in 1975. The following year he was an assistant professor of mathematics at MIT, before coming to Stanford.

His major achievements have been to discover the best way to carry out certain tasks and to prove that there is no better approach. For example, he has obtained definite results about searching for an entry in an ordered list and about doing arithmetic with silicon chips.

He also has made significant contributions to the analysis of algorithms, discovering the average amount of time that a computer needs to perform various important functions, like sorting.

He teaches introductory courses in theory and discrete mathematics to upper-level undergraduate students and to entering graduate students. He also teaches advanced courses about "lower bounds"—proofs that certain tasks are inherently difficult—and about probabilistic methods.

The Bella Lewitzky Dance Company will perform Continuum (a premiere), Duo Concertant, Changes and Choices, and Spaces Between at 8 p.m. Friday, Oct. 22, in Mem Aud.

Openness vs security perennial problem

continued from page 1

universities may regard these reporting requests as objectionable, they should not require monitoring or surveillance of foreign nationals by the universities.

An outspoken critic of the application of ITAR and EAR to campus activities, Lieberman asks, "Is this (restriction on selected foreign nationals) a reasonable trade-off? Is the carrot worth the stick?

"This is an issue over which we all will have to begin a dialogue on our campuses."

The NAS panel recommended that no restrictions of any kind limiting access or scientific communication should be applied to any area of university research, basic or applied, unless it met all four of the following criteria:

1) The technology is developing rapidly and the time from basic science to application is short;

2) The technology has identifiable direct military applications; or it is dual-use and involves process or production-related techniques

3) Transfer of the technology would give the Soviet Union a significant, near-term military advantage; and

4) The U.S. is the only source of information about the technology, or other friendly nations that could also be the source have control systems as secure as ours.

"All of these criteria are important, but whether or not a technology meets these criteria is subjective," Lieberman observed. "Universities may find themselves in constant disagreement with the government."

The panel recommended that "if government-sponsored research demonstrably will lead to military products in a short time, classification should be considered. It should also be noted that most universities will not undertake classified work, and some will undertake it only in off-campus facilities."

Lieberman calls this "a very reasonable recommendation together with an important warning."

Open science invaluable

The panel recommended that in certain gray areas, where all four of the criteria were met but classification was not warranted, the value of open science could be preserved and government needs met by written agreement.

Besides restricting direct participation in government supported research, such agreements could call for submission of stipulated manuscripts (reporting results) simultaneously to the publisher and to the federal agency contract officer, with the agency then having 60 days to seek modifications in the manuscript.

The panel said the review period is not intended to give the government power to order changes—the right and freedom to publish remain with the university, as they do with all unclassified research. This would not detract from the government's ultimate power to classify, in accordance with law, any research it has supported.

The NAS panel indicated that national security is more apt to be enhanced through a policy of open scientific communication that promotes scientific accomplishment rather than through a policy of secrecy controls that yield limited and uncertain benefits. "I fully subscribe to this conclusion."

Lieberman's views were developed in an Oct. 6 speech to the Association of Graduate Schools meeting in Lincoln, Neb., and in a campus interview.

Lieberman text...

continued from page 10

In summary, research universities operate on the assumption that unclassified research should be freely available to all members of the scientific community. I firmly believe that since most university research is "publicly available," and meant for the open literature, the government is straining the intent of the export regulations in applying them to university research. Any concern of the government about access by foreign scholars should be taken into consideration by the State Department when they issue visas. The regulations are so broadly drawn that it is difficult to know precisely what activities are covered. Thus, although one wants to cooperate in protecting the nation's security, I believe that the current government attempts to apply export restrictions to university activities are overbroad, likely to be ineffective, and of doubtful Constitutional soundness. In my judgement they would significantly damage the progress of American science and technology, and thus, actually be detrimental to the national security. The National Academy Panel indicated that national security is more apt to be enhanced through a policy of open scientific communication that promotes scientific accomplishment rather than through a policy of secrecy controls that yield limited and uncertain benefits. I fully subscribe to this conclusion.

Calendar...

continued from page 1

deliberations were "not simply a squashing of minority views by the majority. . . .

"There's no way of making everybody happy when it comes to the calendar."

Humanities and Sciences Dean Norman K. Wessells told the Senate he personally favored a change to six terms of five weeks each, an alternative the committee dubbed "Golub units." It was suggested by Prof. Gene Golub, computer science.

Provost Albert Hastorf said "it bothers me hugely" to see students take as many as seven different courses for a total of 16 units per quarter. Good noted that this was not normally possible, since most academic courses currently carry a minimum of three units credit.

In a memo published last April, the committee sought campus reaction to three possible alternatives: an early semester calendar, a combination of quarters and semesters, and the combination of a fall quarter, followed by an intersession in January and a semester for the remainder of the year.

When Stanford was founded in 1891, the University calendar was based on the semester system, then the norm for U.S. colleges. The change to academic quarters came in 1917.

During 1954-56, two committee studies recommended no change. After surveying 90 institutions, one Stanford study found no empirical evidence favoring the educational superiority of one calendar over another. "The supposed advantages of either (semester or quarter) lie in the realm of opinion reinforced by familiarity," it said.

In 1969, the Faculty Senate voted 16-10 against a recommendation for changing to the semester system, developed during the three-year Study of Education at Stanford.

In the mid-1970s, during the Budget Equilibrium Program, another Stanford faculty committee study concluded that "we have been unable to detect possible cost savings of any significant magnitude which would result from a reorganization from quarters to semesters."

Prof. Henry Breitrose, communications, who headed that study and now sits in the Senate told his colleagues Thursday that the calendar question, "like the locusts," comes back every eight to 10 years.

New degree program to combine medicine and computers

A graduate program integrating medicine and computer science has been established at Stanford University.

The melding of medicine and computer science has led to such recent innovations as helping doctors diagnose patient ills by using computers to analyze their symptoms and medical history.

The new Ph.D. and master's degree program in Medical Information Sciences (MIS) was approved Thursday, Oct. 14, by the Faculty Senate. University President Donald Kennedy praised Dr. Edward H. Shortliffe, assistant professor of medicine and computer science, for a "thoughtful, thorough, impressive" defense of the program before the senate.

Shortliffe is chairman of the interdisciplinary Committee on Medical Information Sciences which proposed the program.

Shortliffe said the normal pattern has been for M.D.s interested in MIS to get a Ph.D. in computer sciences after medical school. He told the senate that such an approach provided the physician with a "highly theoretical" computer orientation often failing to relate effectively to the clinical environment.

Although Stanford has been training a handful of students in the dual discipline of medicine and computer science for several years, Shortliffe explained "that one of the big problems was meeting the numerous requests from students who want to study medical information sciences at Stanford. While the expertise exists here, previously there was no formal program for them to apply.

"Perhaps equally important, there was no structured curriculum to channel students' efforts once they arrived here with an interest in the field."

Shortliffe hopes the MIS program will attract students committed to the medical computer field.

Shortliffe said about 45 potential students, mostly M.D.s, have inquired about the program since its development was made known several months ago.

The new program will be oriented toward persons interested in research and an academic environment, Shortliffe said. During the first year, he said, the program expects to attract two Ph.D. and two master's candidates.

Transfer students can start the program this year, with new admissions to begin in the fall of 1983.

Among potential students are physicians who wish to enhance their knowledge of computer science or of formal medical decision-making ability. Other students could be computer science majors with a background in biology or a related field who wish to make a commitment to medical information.

Ph.D. and two-year M.S. programs, according to the committee, are intended primarily for persons who are medical students or who already have an M.D., as well as other students seriously interested in MIS as a career.

A limited one-year master's program is intended, Shortliffe said, as supplemental training for researchers who want a background in computer decision-making to facilitate their work.

"We are hoping to develop a small cadre of students who will enter this program with a commitment to stay in the medical computer field.

"Without the specialized degree which this program offers, students who combined the two disciplines on an informal basis often were enticed into other areas of the rapidly expanding computer science field," Shortliffe said.

Members of the committee, in addition to chairman Shortliffe, include Drs. Bruce Buchanan, adjunct professor of computer science; Edward Feigenbaum, professor of computer science; Michael Genesereth, assistant professor of computer science; Richard Popp, professor of medicine; Allen Ream, associate professor of anesthesia; Harold Sox, associate professor of medicine (clinical); Gio C.M. Wiederhold, assistant professor of computer science; and Leslie Zatz, professor of radiology.

—Mike Goodkind

Weekend fire in Fairchild serves as safety reminder

A $20,000 fire in a Sherman Fairchild Research Building laboratory points to the need for safety committees and posting lists of chemicals outside labs, the University's director of health and safety said this week.

The Sunday morning blaze caused no treatable injuries and did not destroy critical research, officials have said.

The safety director, Alain Decleve, said that while all chemicals appeared to have been safely stored in the lab of Dr. Roger Kornberg, professor of structural biology, constant vigilance and some modifications are needed throughout the University.

"We are currently promoting a system in which small metal (fire resistant) boxes are placed outside all laboratories listing the location (and content) of all potentially hazardous material in the lab as well as the names and phone numbers of principal contacts, who could answer questions about material for firemen."

DeCleve said the University recently received 1,000 boxes which could be installed within six months.

Overall, Decleve pointed to the need for departmental or unit fire safety committees to constantly review what steps need to be tailored for each area.

"Some departments—including Pathology and Dermatology—already have establised fire safety committees. But unfortunately, safety has not been the most important thing in the mind of (some) researcher(s)," Decleve added.

A short circuit in an electric motor was cited as the apparent cause of Sunday morning's fire.

Thirteen Palo Alto firemen responded after an alarm was pulled at 9 a.m. by a lab assistant who saw smoke emanating from a broken window in the Fairchild building. The worker, Jonathan Hardy, said he spotted the flames while riding his bicycle to work in a neighboring lab in the same building.

Batallion Chief Don Shaw said the small blaze had had been extinguished by the building's sprinkler system before the first of his men arrived about seven minutes after the alarm was pulled.

A Stanford security supervisor, Pedro Guzman, received a minor cut on his finger while manipulating a fire extinguisher through the window of the lab moments before the firemen arrived. Guzman, who did not require treatment, said the blaze was already out by the time he used the extinguisher.

Heated plastic

The laboratory was being used by Kornberg to conduct DNA research. The source of the blaze, said Kornberg and Shaw, was the electric motor heating an approximately one-square foot plastic water bath, a device used to house small quantities of water in which biology experiments on the molecular level are conducted.

Shaw said plastic creates a large amount of smoke relative to volume.

Kornberg said he expects within several days "to clean that mess up and get going again with experiments." He said the water dish was being heated to body temperature but contained no experimental biological materials—cellular cultures—at the time.

He has been working in research on how hereditary information is encoded in cells.

Kornberg estimated the cost of replacing equipment burned in the fire at $10,000, and said it included mostly small paraphernalia. The water dish, he said, was the most expensive item, valued at about $200.

Shaw said damage to the building, mostly flooding from the sprinkler system, was estimated at about another $10,000.

No dangerous chemicals or radiation were released in the fire, although Kornberg said some common lab chemicals, including phosphoric acid, were stored in metal containers near the fire.

Firemen observed extremely low doses of radiation—about the equivalent of a watch dial—in the room. Kornberg said tiny amounts of radioactive tracers were used in test tubes which might have broken in the heat of the blaze.

Dominick Purpura

Dean to deliver SMASH lecture

This Friday's S*M*A*S*H lecture will feature Dr. Dominick Purpura, dean of the School of Medicine and associate vice president for medical affairs.

Purpura will discuss "Cellular Neurobiology of Mental Retardation," at 4:30 p.m. Oct. 22 in Fairchild Auditorium, with a TGIF gathering afterwards in the lobby. All interested members of the Medical Center community are invited to attend.

Device aids mild hearing loss as well as a cupped hand

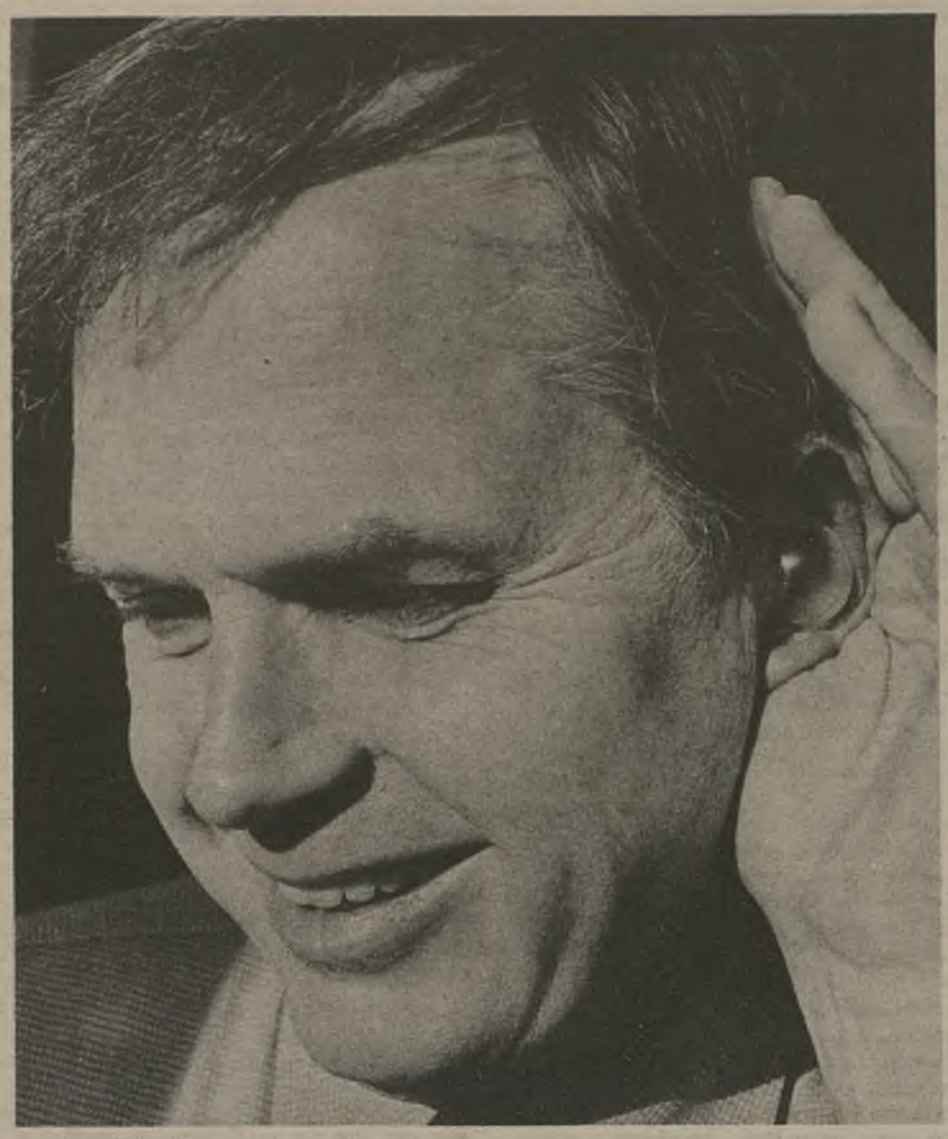
A new non-electronic hearing aid, which provides as much improvement as listening to speech or music with one's hand cupped behind the ear, was unveiled by Stanford University School of Medicine researchers Monday, Oct. 18.

"The device, called an Earesonator, can be an answer for mild hearing loss affecting more than a million Americans," said Dr. Richard L. Goode, professor of surgery. *(See promotion story below.)*

Goode and his colleague, Richard O'Keefe, worked on the Earesonator for the past four years to perfect it.

"So far 30 patients with mild hearing loss have been fitted with the tiny plastic device," Goode reported. "The patients studied with pure tone audiometry have shown improvement of 10 to 20 decibels at key speech frequencies."

The new device, designed to be custom-fitted and worn within the ear, was introduced as part of a scientific exhibit at the annual meeting of the American Academy of Otolaryngology and Head and Neck Surgery in New Orleans, LA.



The average external ear only resonates at the high frequencies between 2800 to 4000 Hertz producing 10 to 15 decibels of sound amplification, Goode explained in an interview. A hertz, or Hz for short, is a unit of sound frequency measurement.

"Essentially, the external ear provides no amplification for the middle frequencies of 1000 to 2500 Hz, which comprise a very important speech range," he said.

"When the Earesonator is inserted into the ear, it changes the opening size and volume of the ear cavity, shifting the resonant frequency downward. This provides a sound boost of 10 to 15 decibels in the important 1000-2500 Hz speech frequency range."

By adjusting the size of the opening in the plastic device, the Earesonator can be fine-tuned to provide maximum amplification at the frequency the patient needs most.

"Potential users," Goode said, "can get some idea of the improvement that can be obtained by listening to speech or music with their hand cupped behind the ear—something many people do regularly."

Here, Goode demonstrates a new inexpensive, non-electronic hearing aid, capable of boosting sound in the key speech frequencies. The device, called an Earesonator, can provide an answer for more than a million Americans with mild hearing loss, according to Stanford University medical researchers. It is custom-fitted and fine-tuned to meet the patient's individual needs.

Goode said anyone with mild unilateral or bilateral hearing loss should be helped by the device. Most people would require two, one for each ear.

For binaural fittings, each device is tuned to a slightly different resonance peak to expand the useful bandwidth of amplification.

Goode said the Earesonator cannot provide the same amount of amplification as an electronic hearing aid. But in cases of mild hearing loss only a small amount of amplification is needed.

"These people don't feel they need a conventional electronic hearing aid since they only have trouble hearing at certain times, such as when background noise is present or the speaker's voice is soft or high pitched," Goode said. "At other times they may get along quite well. They don't want to bother or spend as much as $300 for an electronic hearing aid. Now there's a choice."

Goode said the Earesonator, estimated to cost $50, is actually an extension of acoustical in-the-ear devices that have been around since the mid-1800s.

"But none of these earlier models provided adequate amplification for a variety of reasons," Goode said. In fact, he obtained some of the old devices from the hearing aids museum at Kent State University in Ohio and tested them.

"They made wonderful earplugs," Goode commented. "This is because the earlier inventors did not fully understand acoustical principles and did not have the sensitive sound measuring instruments now available."

This is how a patient is fitted with the Earesonator at the Stanford Ear, Nose and Throat Clinic:

First, a pure tone audiogram is made to determine the patient's thresholds in the mid-range sound frequencies. Next an impression is made of one ear or both, and impressions and audiogram are mailed to a laboratory.

In three weeks, the finished devices made of butyrate (clear) plastic and methyl methacrylate, a material used in dentures, are mailed back to be fitted and fine-tuned.

For the time being the Earesonator is available for research purposes at Stanford and the affiliated Palo Alto Veterans Administration Medical Center only. But Goode hopes they will be eventually mass produced if a manufacturer is interested.

—Spyros Andreopoulos

School of Medicine faculty promotions, appointments

The Board of Trustees last week promoted two School of Medicine physicians to professor, while two other faculty members were appointed associate professors.

Drs. David Clayton, pathology, and Richard Goode, surgery, are the new professors.

Dr. Michael Hendrickson was appointed associate professor of pathology (clinical), and Dr. Norman Lewiston was named associate professor of pediatrics (clinical).

Clayton, who has served since 1977 as program director for the Medical Scientist Training Program, has focused his research on DNA cloning. He came to Stanford in 1970 as an assistant professor of pathology after receiving his Ph.D. in biophysics from the California Institute of Technology, Pasadena.

Goode, whose surgical specialty is otolaryngology, has been an innovator in the use of lasers for treating recurrent ear infections in children. Recently he spearheaded development of an inexpensive acoustic resonator to treat mild hearing loss. *(See story above.)*

A 1961 graduate of the University of Southern California, Goode completed his residency in otolaryngology at Stanford in 1966 and then joined the faculty as an instructor. He has been chief of the division of otolaryngology at the Palo Alto VA Medical Center since 1966.

Hendrickson received his M.D. from Stanford in 1971. He served his residency at Stanford and was then appointed to the faculty as an acting assistant professor of pathology in 1975.

He has done research in the role of pathology in cancer treatment and in cancer of the uterus.

Lewiston, who received his M.D. from the University of Iowa, has authored or co-authored numerous articles and book chapters on cystic fibrosis and pulmonary function testing, particularly in a pediatric setting.

Lewiston completed his residency at Stanford in 1971. He currently serves as chief of allergy and pulmonary diseases and director of the pulmonary function laboratory at Children's Hospital at Stanford.

Loren R. "Yank" Chandler

Former dean Chandler dies after brief illness at 88

Dr. Loren R. "Yank" Chandler, noted surgeon and dean of Stanford University School of Medicine from 1933-53, died Saturday, Oct. 16, in Palo Alto following a brief illness. He was 88 years old.

"Defying the average term for deans of five years, Chandler remained dean for 20 years. He graduated 21 classes of physicians from the San Francisco campus, many of whom have since gained national prominence," said Dr. Lawrence G.Crowley, vice president for medical affairs at Stanford University Medical Center.

Chandler saw the Medical School through the Depression and WWII. He was a favorite of both faculty and students. He believed a good faculty was the key to a good medical school.

"You can have all the buildings you want, but you must also have the experts—the masters who can make a thing so simple that the student wonders why he didn't think of it himself. You need experts who can teach. And good teachers will produce others, who at the same professional age, will be better than they were," he believed.

"As former dean of Stanford Medical School in San Francisco and one of the most beloved members of the Stanford community, Chandler leaves a legacy of committment and responsibility to superb medical education. Although all will be saddened the news will stimulate warm memories in the minds of the hundreds of physicians who knew him well and whom he knew individually," said Dr. Dominick P. Purpura, dean of the Medical School.

"Chandler was just as likely to have been the attending faculty member on surgical wards of a hospital as one to whom students turned to when they needed a friend to provide warm encouragement and guidance about future careers," said Purpura.

Wrote the *San Francisco Chronicle* when Chandler retired from the deanship in 1953, "Yank Chandler has been a notable dean and his administration has lent distinction to Stanford's place in medicine."

Considered a leader in the development of medical education, Chandler was president of the Association of American Medical Colleges from 1941-42, and president of the California Academy of Medicine in 1942.

His leadership exceeded the boundaries of medical education, however. He was on numerous federal commissions, and in national, state, and local organizations. He was president of the Pacific Coast Surgery Association in 1954-55; president of the San Francisco Surgical Society in 1948; and a fellow in the American College of Surgeons. He was also associated with the San Francisco Medical Society, the California Medical Association, the American Medical Association (AMA), and the Americal Surgical Association.

In 1950, Chandler was one of three men appointed to a commission of the AMA to study the effects of the British National Health Science Act. He concluded that it would be a "folly" to institute such a plan in the United States.

During a sabbatical in 1955, Chandler organized the staff and was chief surgeon at the Albert Schweitzer Hospital in Deschappelles, Haiti.

Chandler was an advocate of prepaid medical care, and was instrumental in developing the California Physicians Service and Blue Cross.

Born in Fresno, Calif. in 1895, Chandler received his A.B. degree from Stanford in 1920, and his M.D. degree in 1923. He was a surgery intern and resident at Lane Hospital from 1923-25, and then went into private practice. He maintained his association with the Medical School as clinical professor of surgery. He was appointed associate professor of surgery in 1933, and full professor of surgery in 1938.

From 1959 until his retirement, he served as chief of surgery at the Palo Alto Veterans Administration Hospital, of which he was a key planner.

In 1959 Chandler was made honorary fellow of Stanford University, the highest and seldom bestowed honor of the University.

Chandler is survived by his wife, Elvia Beal; son Craig; daughter Loran McIvor; and grandchildren.

At Chandler's request, there will be no memorial services. According to the family, memorial contributions can be made to the Loren R. "Yank" Chandler Memorial Fund, c/o Stanford University Medical School, or to any preferred charity.

HMP gets associate director

Gerald R. Moller has been appointed associate director of the Hospital Modernization Plan effective last Friday, Oct. 15, SUH director Sheldon King has announced.

Moller, who holds a B.S. in engineering from the U.S. Merchant Marine Academy, has had extensive experience in hospital construction management, said HMP Director Elvia Garwood. Moller's most recent job was associate administrator for building projects at Children's Hospital of San Francisco, where he has worked in various capacities since 1949.

In his new role, Moller will be responsible under Garwood's direction for supervising the construction of the HMP. He will also be involved in the design and approvals for the project, a five-year program intended to modernize SUH's facilities. Also planned is the consolidation of the Hospital's pediatric facilities and those of Children's Hospital at Stanford in the new construction.

Gerald Moller

The approved cost of the project and financing is $124 million, although adjustments to its scope could be made based on projected need and available finances. A Certificate of Need application, detailing the Hospital's proposal, is expected to be filed with state and regional agencies in about a month, Garwood said.

Barchas to talk on mental illness

"Psychobiology: New Approaches to Mental Illness" is the topic of a public lecture to be held 8 p.m., Thursday, Oct. 28, in the Sherman Fairchild Auditorium at Stanford University Medical Center.

Speaker for the special program will be Dr. Jack Barchas, Nancy Friend Pritzker Professor of Psychiatry and Behavioral Sciences at Stanford and director of the Nancy Pritzker Laboratory of Behavioral Neurochemistry. Dr. Thomas Gonda, professor and chairman of the Department of Psychiatry and Behavioral Sciences, will serve as moderator.

Admission to the lecture is free, and there are no reserved seats. The program will be sponsored by the Friends of Psychiatry and Behavioral Sciences at Stanford. For further information and to help the organizers plan for adequate seating, please call 497-6376.

Letters to the editor

Why exclude elderly from research?

Editor, *Campus Report:*

I was alarmed to read (Aug. 25) that Stanford cardiologists are using "age greater than 75 or a severe life-limiting medical condition" as grounds for refusing emergency streptokinase therapy to halt heart attacks in progress.

Do the doctors have hard evidence that such treatment won't work on these cases (the only morally decent justification)? Or have they just taken it upon themselves to decree that the lives of the old and the chronically ill aren't worth saving?

Diana Ackerman
Visiting Scholar, Philosophy

Campus Report approached Dr. Edwin Alderman for a response to the above letter, referring to the article "New Heart Attack Drug given Two Ways, Compared by Study," on page 13 of the indicated issue. His reply follows:

Emergency Streptokinase therapy is indeed relatively effective in "dissolving" clots responsible for blocking blood flow through coronary arteries. However, it has not yet been established that relief of this obstruction can be accomplished sufficiently promptly to prevent heart muscle damage from occurring. A substantial portion of the heart muscle involved may already have been irreversibly damaged by the time the clot lyses. Therefore, until there is conclusive evidence that lysis of coronary blood clots is effective therapy, I am reluctant to expose elderly patients to the hazards of lytic drugs which include a risk of prolonged and excessive bleeding for a period of 36 hours following drug administration. It seems unwise to expose elderly individuals who have a substantially higher mortality rate associated with heart attacks to the risk of bleeding complications without substantial proof that the therapy is beneficial. Moreover, the considerable effort involved in doing emergency procedures of this sort and giving Streptokinase requires that patients be enrolled who have a better chance of survival with their heart attack.

The age of 75 is indeed an arbitrary demarcation, but is considered reasonable for the purposes of this study. This protocol has been reviewed by Stanford's Institutional Human Subjects Review Committee, and it is customary practice to exclude elderly patients from research studies for whom the risk of complication is higher and ability to tolerate adverse drug side effects is lessened.

Edwin L. Alderman, M.D.
Associate Professor of Medicine
Cardiology Division

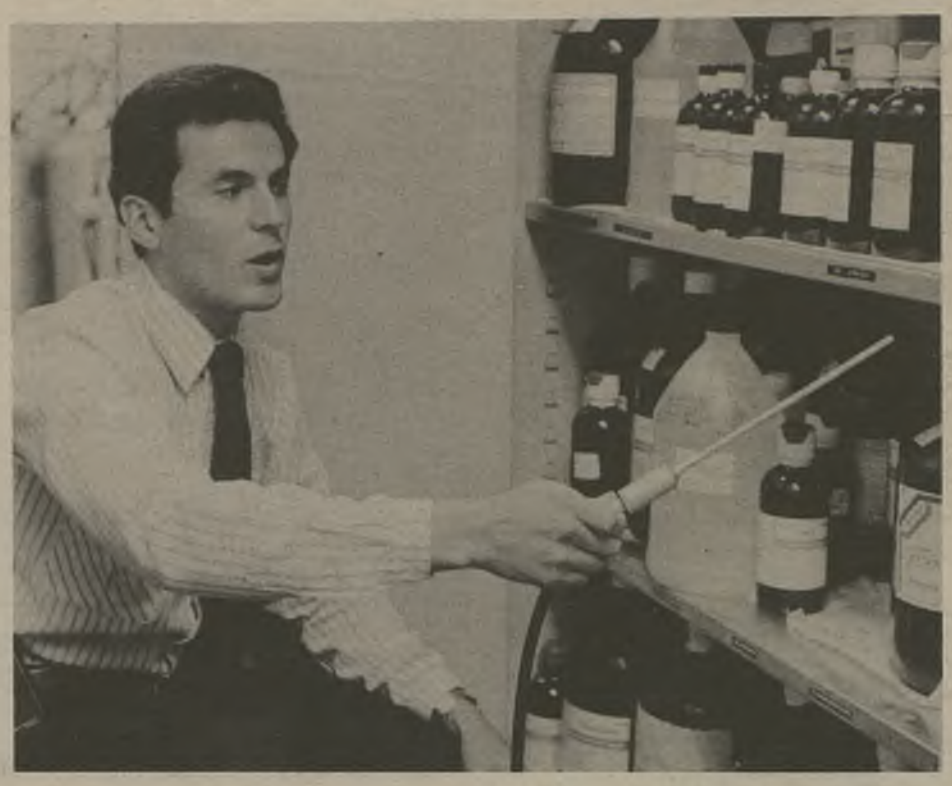
'Selling' safety at work requires much effort, says Perez

Ruben Perez helps keep employees safe.

For example, one morning in October he received a call from a Medical School department where "one individual had felt very, very sick because some kind of gas was coming into his office through his window."

Perez, the assistant director of Facilities Protection for safety, explained that the office worker, an athlete, had complained of flu-like symptoms suffered after inhaling the fumes. Perez examined the area and found that a chemical irritant was infiltrating the man's office ventiliation from a laboratory below. Perez was able to find the source and take remedial action.

"In this job," Perez said, "there is an atmosphere of immediate job satisfaction.



"Our office is responsible for the occupational health and safety of employees. We're additionally responsible for the fire safety of the entire Medical Center.

"For example, in a laboratory fire safety is critical. We would be concerned with the proper storage of chemicals."

As assistant director, Perez reports to Hilary Ryniewicz, the director of Facilities Protection. Another assistant director in the department, Larry Jordan, directs security.

Perez came to Stanford as an occupational health and safety assistant after graduating from California State University-Hayward in 1979 with a B.S. in occupational health and safety. About a year ago he was promoted to his present job.

"I have always been interested in health," Perez said. "When I started college I worked for a physical therapist for about one year. I felt it was a good profession to get into, but not for me. It was a little too restrictive. The doctor would give a prescription and the therapist would have to follow it. It didn't seem right to me that the therapist was not included in the loop for the prescribed treatment."

Perez, assistant director of Facilities Protection for safety, uses a combustible gas indicator to check for a possible leak in chemicals stored in a laboratory cabinet. (He didn't find any.)

It was during his junior year that "things started falling in place." After two years of pre-med courses, "I decided I wasn't disciplined enough, not hungry enough to go into medicine."

And about that time he heard a lecture at school indicating that job prospects would be expanding in industrial hygiene because of burgeoning legislation requiring careful monitoring of occupational safety.

The opportunity and his background "fit perfectly," Perez said. "I'd be dealing with people's health, I'd be doing something I'd feel I'd be getting some worth out of, and I'd be getting out of school with what looked like pretty good job prospects."

And conveniently, the prerequisites for the B.S. degree in occupational health and safety which Perez ultimately received were the same as those for pre-med. Now Perez is working on his masters in the field via an extension program offered by the University of Southern California.

Perez' workday is varied.

He conducts regular inspections throughout the Medical Center for safety violations. He is responsible for compliance with a variety of codes and laws. At the halfway point of each remodeling project, he reviews the plans to ensure that safety standards are met.

Perez coordinates and sometimes teaches in-service safety classes for employees ranging from such topics as back safety to the proper handling of gas cylinders.

Providing a direct leadership role, he is *ex officio* chairman of the environmental health and safety committee.

Even though a lot of emphasis is focused on technical expertise, "the work is almost like a selling job," Perez believes.

"You have to have a continuous effort to make people aware of safety. It usually isn't something people think about until after they have had an accident or injury.

"When you have something like the safety committee, you have to give it constant attention, or three months after it is started it could die."

Perez said he attends meetings of the departmental safety committees and keeps in touch with key members of these groups.

The effort to convince employees and management of the importance of a safety program can be frustrating, Perez said, but he would recomend his career "to a person who likes working with people.

"You have to be somebody who can deal with frustration but at the same time it's really rewarding, because what you're doing is helping people—you might be saving someone's life, you might be saving someone's livelihood."

To relieve frustrations—and sometimes just for enjoyment—Perez said he jogs about three miles a day, often with a recently organized University-sponsored running club.

He is a B racquetball player, and enjoys skiing, tennis and a variety of sports. Perez also plays guitar ("mostly folk and easy listening music") and had his own nine-piece combo while attending high school in Hayward.

Medical Center Calendar

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservation required. Call 497-6389.

PUBLIC EVENTS

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

WEDNESDAY, OCTOBER 20

Dept. of Pathology Basic Research Colloquium: "Cloning of DNA Repair Genes from Caccharomyces Cerevisae"—Dr. Errol C. Friedberg. 5 p.m., Fairchild Auditorium.

Dept. of Neurology Grand Rounds: "Sleep Autonomic Nervous System Dysfunction"—Dr. Christian Guilleminault. 5 p.m., Palo Alto Veterans Administration Medical Center, B108, Bldg. 7.

Div. of Hematology Conference: "Molecular Mechanisms of Oncogenesis by Retrovirus"—Dr. Philip Tsichlis (National Cancer Institute, NIH). Noon, S102d.

Hospital's Second Annual Safety Faire Display: "Patient, Employee, Chemical, Radiation Safety." 10 a.m. till 4 p.m., corridor outside main center cafeteria.

THURSDAY, OCTOBER 21

Dept. of Pharmacology Seminar: "Structure, Function, Analysis of Globoside-Binding *E. coli* Pili"—Dr. Gary Schoolnik. 4:15 p.m., R358.

Dept. of Medicine Grand Rounds: "Acquired Immunoregulatory Dysfunction Syndrome"—Dr. Paul Volberding (UCSF). 8:30 a.m., Fairchild Auditorium.

Hospital's Second Annual Safety Faire Exhibit: "Disaster Preparedness." 10 a.m. till 4 p.m., corridor outside main center cafeteria.

FRIDAY, OCTOBER 22

Second SMASH Lecture of Autumn, 1982: "Cellular Neurobiology of Mental Retardation"—Dr. Dominick Purpura. 4:30 p.m., Fairchild Auditorium.

Dept. of Pediatrics Grand Rounds: "Febrile Seizures Experimental and Clinical"—Dr. David Holtzman. 8 a.m., M106.

Hospital's Second Annual Safety Faire: "Fire/Electrical/Rape Awareness/Protection in the Home Display"—with Palo Alto Fire Department. 10 a.m. till 4 p.m., corridor outside main center cafeteria.

Surgical Pathology Conference: "Oxford: Sabbatical and/or Science?"-Dr. Roger Warnke. 8 a.m., L201.

SATURDAY, OCTOBER 23

Fifth Annual Conference on Child Development: Sponsored by the Dept. of Pediatrics. 8 a.m. till 5 p.m., Kresge Auditorium.

Northern California Cancer Program Symposium: "Mechanisms of Resistance to Anticancer Drugs, II: Alkaloids, Antibiotics, and Alkylating Agents." Advance registration required. 9 a.m. till 3 p.m., Fairchild Auditorium. For further information, call Martha Kaplan at 497-7431.

MONDAY, OCTOBER 25

Dept. of Biochemistry Seminar: "Human Tubulin Genes and Pseudogenes—Their Structure and Expression"—Dr. Deborah Wilde (NYU). Noon, M316.

WEDNESDAY, OCTOBER 27

Basic Science Research Colloquium: "Mechanisms of Interferon's Actions"—Dr. Thomas Merigan. 5 p.m., Fairchild Auditorium.

Dept. of Neurology Grand Rounds: "Reaction of Substantia Nigra to Massive Basal Ganglia Infarction"—Dr. Lysia Forno. 5 p.m., Palo Alto Veterans Administration Medical Center, B108, Bldg. 7.

Div. of Hematology Conference: "Expression of Oncogene in Normal and Transformed Lymphoid Cells"—Dr. William Schubach (Fred Hutchinson Cancer Research Center, Seattle). Noon, S102d.

Puberty Education Course: "What's Happening to Me—Learn About Your Changing Body." For boys and girls aged 10 to 12 and their parents. 7:30 till 8:30 p.m., Children's Hospital at Stanford. Series also offered starting November 3. For further information, call Dr. Paula Duke at 327-4800 ext. 538.

Div. of Orthopedic Surgery Grand Rounds: "Traction Techniques"—Dr. Norman Kane, 7:30 a.m., M114, and "Mini Total Hip Replacement"—Dr. Steven Woolson, 8:30 a.m., M114.

THURSDAY, OCTOBER 28

Friends of Psychiatry and Behavioral Sciences: "Psychobiology, New Approaches to Mental Illness"—Drs. Thomas Gonda, moderator, and Jack Barchas, speaker. 8 p.m., Fairchild Auditorium. For further information, call 497-6376.

Calendar items must be received in the Office of Public Events, 800 Welch Road, Suite 221, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

...News Notes...

Duane Walker

Duane Walker, R.N., M.S., director of Nursing Services at SUH, will serve as chairperson of the interim executive committee of the National League for Nursing's new Council of Nursing Service for Hospitals and Related Facilities.

The council was formed earlier this year for nursing service departments. Membership is open to all organizations, divisions, and departments that are engaged in providing nursing services.

Initial council projects under study involve development of a nursing administrative manual and of innovative institutional cost allocation systems that would help establish nursing service departments as revenue-producing units.

* * * *

Mary Catherine Krawec, associate director of SUH, is the Medical Center person to call with questions about earthquake preparedness, reminded Stanford President Donald Kennedy in a recent memorandum to deans, department heads, and principal investigators.

Krawec is responsible for the earthquake preparedness of buildings, utility systems, and major equipment in the Medical Center. Kennedy's announcement explained the University Committee on Earthquake Preparedness' recommendations of steps to further Stanford's readiness.

He added, ". . .it is up to each of us to find out what the risks are in our own University working environments and to take sensible, practical steps to deal with them." Department safety committees conduct periodic inspections of all areas and make recommendations on ways to improve earthquake preparedness. They should be consulted whenever questions arise.

"It is important for us to maintain a good preparedness program, since the earthquake hazard at Stanford becomes more severe as additional time elapses," noted Kennedy.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Course to teach meeting management

Do you attend meetings, week after week, with no idea of what will be discussed? Do some meetings drag on and on until someone finally says, "Let's continue this at our next meeting"? Or, have you found that all too often in your meetings, people digress to issues which are not relevant to the topic at hand?

"Frustrations like these are common for almost all managers," said Dale Ironson, training specialist in the Hospital's human resources development department.

"A recent study showed that, on the average, a manager spends approximately 30 percent of his or her time in meetings. How much more effective our time would be if these meetings were only 50 percent more productive, not to mention less frustrating and time-consuming," Ironson added.

Committed to helping managers at Stanford improve the effectiveness of their meeting time, the HRD department is offering a special course on Meeting Management skills, the Thursday mornings of Nov. 4 and Nov. 18.

Some hints managers might find useful, said Ironson, are:

- Ask if this meeting is really necessary. Can it just as well be handled by a phone call or memo?
- Phone or send a memo to participants in a meeting to let them know what will be discussed;
- Post an agenda on the wall at the beginning of a meeting;
- Make certain the end results of the meeting are clear in everyone's mind at the outset;
- Specify what the ending time of the meeting will be as well as its starting time.

Managers interested in learning more about these and other techniques should register for the course by calling HRD at 497-5233.

Medical Faculty Opening

Stanford University is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

The division of orthopaedic surgery at Stanford University School of Medicine is seeking a physician to fill an academic position at the rank of assistant professor of surgery, to be based at the Veterans Administration Hospital.

The position requires an individual well trained in all clinical areas of orthopaedic surgery, particularly adult reconstructive surgery, with interests and training in the care of the spinal cord injured patient.

This individual will function as assistant to the chief of the orthopaedic service at the VA Hospital, with additional clinical and academic responsibilities within the Stanford University School of Medicine teaching program.

Letters of inquiry and curriculum vitae should be sent to: E.E. Bleck, M.D., Dept. of Surgery, Div. of Orthopaedic Surgery, Room R-169, Stanford University School of Medicine, Stanford, CA 94305.

Rosse tells why local phone rates will rise while long distance costs fall

Stanford economics Prof. James N. Rosse predicts "protracted warfare" before the Federal Communications Commission over long-distance telecommunications policy in the wake of recent court cases and regulatory decisions against American Telephone and Telegraph.

In recent informal remarks to associates of Stanford's Center for Economic Policy Research, which he directs, Rosse said: "It took a hard knock to shift AT&T out of its comfortable regulatory rut, but it's out now.

"The industry is being reorganized on a somewhat more rational basis than might have been expected, and the most important values have been preserved.

"Competition in terminal equipment markets has been firmly established, perhaps even enhanced. . . .

"Although the job isn't done yet, it looks like the local operating companies (like Pacific Telephone and Telegraph) are being put on a fairly firm base.

"More importantly, they are being put in a more nearly one-to-one relationship with state regulators (like the California Public Utilities Commission). This is a healthy situation, although it will take some of the fun out of being a regulator.

"The foremost industrial producer of technology and science—the combination of Bell Labs, Western Electric, and AT&T Long Lines—has largely been preserved. . . . The creation of American Bell, the unregulated—subsidiary, provides an outlet. I have high expectations for this no longer sleeping giant."

Where long-distance rates formerly subsidized local telephone costs, "now we'll get higher local access rates," Rosse says. "But then we should get higher local access rates.

"(But) we have created a regulatory monster in long-haul markets. Barring unexpected technological change, the market outcome would be continued AT&T dominance. I don't think the regulators are prepared to accept that outcome. Instead, I expect protracted warfare among the long haul carriers, which now include General Telephone and Electric, since it acquired the Southern Pacific Sprint system.

"The warfare will not be in the marketplace, but before the FCC. Ultimately, the commission will settle down to administering the problems of market division in the unstable, regulated oligopoly that has been created.

"There will be significant economic loss and social cost, but all in all, it is probably a better outcome than we deserve. . . .

"Regulatory agencies can be awfully poor mediators of change, even with the best will in the world. No one can accuse the FCC of not having tried."

Regulations rigid

Historically, he notes, "once in place, regulatory institutions are extremely rigid and resistant to change. . . .

"The Communications Act of 1934 set an objective of universal service offered at fair rates. Over the years, 'fair' came to mean uniform rates for all, and universal service came to justify the existence of cross-subsidies to carry service to those who couldn't or wouldn't pay for it."

With the introduction of microwave technology, regulators in the 1950s and 1960s began to load more and more of the

James Rosse

cost burden on long-distance service, even as long-distance rates themselves declined.

But the averaging of rates required by "fairness" meant that customers located in dense, lower-cost markets failed to benefit from lower costs.

As the gap between microwave transmission costs and regulated rates grew, large users like the Defense Department and General Motors threatened to build their own systems. By the late 1960s, specialized customers like MCI and Sprint started long-distance microwave systems competing with AT&T for business customers.

"You can't make butter if someone else skims your cream," Rosse observes, "The loud noise you heard at the settlement was AT&T finally abandoning the public utility band wagon and jumping to the chariot of competition."

Bell's transistor

Besides advancing microwave technology, Bell Labs invented the transistor which made "equipment for the phone system far more reliable.

"In the early days, AT&T could make a 'no foreign attachments' rule stick because of the potential harm to an integrated system," Rosse says. The integrity of a rather fragile system was maintained by keeping it Bell from end to end.

"As good electronics became cheaper and more reliable, that justification became harder and harder to maintain. . . . Now anyone can own the terminal equipment they use. More importantly, anyone can make it as long as it lives up to minimum engineering standards.

"This has created a large and burgeoning industry, supplying everything from answering machines to fairly large telephone systems. For instance, Stanford, with its thousands of telephones, may very well become the owner and operator of a non-Bell system within a few years."

Rosse has been a consultant to the Federal Communications Commission, the Federal Trade Commission, American Telephone and Telegraph, among others.

He has done research in such areas as the future of mass communication, communications technology and public policy, and economic policy and regulated industries. His monographs include one on social welfare, pricing policy, and income redistribution in telephone service.

These are the buildings at 64-70 High Street, Oxford which Stanford will remodel.

Trustees approve 1984 move to Oxford

Stanford's Board of Trustees has approved moving the overseas studies program in Britain from Cliveden to Oxford at an estimated cost of nearly $2.2 million.

Approximately 50 undergraduates will be accomodated in renovated facilities at 64-70 High Street, across from Magdalen College in the heart of the Oxford University complex, starting in the fall of 1984.

The new center, now a collection of three- and four-story, 200- to 300-year old buildings, would be leased for 75 years, starting Nov. 1. Approval for the lease is currently being considered by Oxford.

Stanford will borrow funds for the renovation. The Cliveden campus, housed in the Astor estate, will close next September. Stanford studies indicate that costs at Oxford will be significantly lower than those at Cliveden by 1985-86.

A report considered by the trustees Tuesday, Oct. 12, noted that Oxford offers "distinct academic advantages," combining courses by British scholars paid honoraria with Stanford professors assigned to Oxford for three to six months.

The resulting curriculum will be characterized by "breadth of subject matter and excellence of faculty." Stanford students will have access to Oxford University lecture courses, to opportunities for tutorial and directed reading (limited only by budgetary considerations and individual academic needs), and to the broad range of extracurricular academic activities associated with a major university—lectures, libraries, museums, galleries, and bookstores.

Magdalen College will help Stanford obtain access to Oxford's libraries, which are primarily reading rather than lending libraries, and will provide a large lecture hall for Stanford's use in its "Wayneflete" building, about a two minute walk from the new Stanford site.

"There could be no better location in Oxford for a Stanford center," the report noted.

Since its creation in 1958, the Stanford overseas studies program has become the largest undertaking of its kind by any major American university. Before graduation, between 35 and 40 percent of Stanford's undergraduates spend six months or more studying overseas.

Directed by Prof. Mark Mancall, history, the program also operates in Austria, Germany, France, Italy, Spain, Peru, Kenya, and Israel.

Overseas teaching applications open for 1984-85 year

The Overseas Studies Office, on behalf of the Academic Program Committee of Stanford Overseas Studies, is now accepting applications for overseas teaching assignments in 1984-85: for the autumn, winter, and spring quarters in Berlin, Florence, Tours, Vienna; and the Paris Program for autumn and winter quarters.

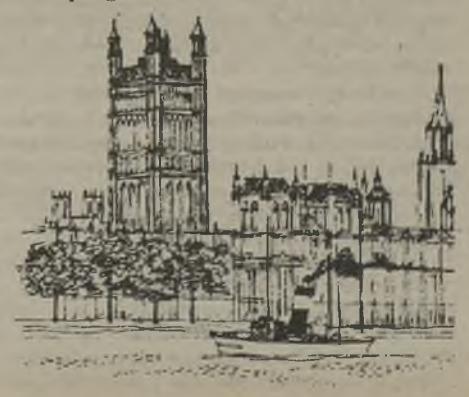
A limited number of positions may be open in England for autumn, winter, spring, and summer quarters.

Applications for Haifa will be accepted for a full year, beginning in summer quarter of 1983-84.

The deadline for applications is December 15, 1982. Faculty from all schools in the University are encouraged to apply.

Only limited funds, however, are available at this time to support non-Humanities and Sciences faculty. Applicants from non-H&S schools may contact the dean of their school or Mark Mancall, director of Overseas Studies, to discuss the issues involved. Funding limitations preclude consideration at this time of faculty who will have emeritus status in 1984-85.

Courses proposed which take advantage of the unique resources that are immediately accessible in the overseas setting will be accorded a high preference by APC/SOS, which will make selections for teaching assignments during the month of February. Announcement to faculty nominated will be made shortly thereafter.



For application forms and more information about teaching overseas, contact Daryl Sawyer, Amy Sims, or Mark Mancall in the Office of Overseas Studies, room 112 of the Old Union, 497-3555.

The Academic Program Committee of Stanford Overseas Studies reports nomination of the following home campus faculty to teach overseas during the 1983-84 academic year: Berlin—Profs. Leonard Ortolano, civil engineering, and William S. Eddelman, drama.

Nominated for England are faculty from the English Department—Anne K. Mellor, Thomas C. Moser, W. Bliss Carnochan, and Diane Middlebrook; from the Medical School, Bruce R. Parker; and from the School of Education, Elliot Eisner.

Faculty nominated to the Florence program are: Prof. Beverly Allen, Italian; Philip Zimbardo, psychology; Michael Jameson, classics; Leonard Ortolano, civil engineering; Stephen Ferruolo, history; and Solomon Feferman, mathematics.

In Tours, nominees are Prof. Albert Guerard, English; and in Vienna, Prof. Walter Lohnes, German studies; and Wolfgang Kuhn, music. Prof. Alphonse Juilland ha been nominated to teach in the Paris program.

Senate approves Medical Information Sciences program, hears interim report on academic calendar

TO MEMBERS OF THE ACADEMIC COUNCIL
FIFTEENTH SENATE REPORT No. 3

A meeting of the Fifteenth Senate of the Academic Council was held on Thursday, Oct. 14, 1982, beginning at 3:15 p.m. in Room 280 of the School of Law, with Chairman A.L. Fetter presiding.

On this occasion, the Senate took a number of actions, as follows:

1. Annual Report of C-GS

The Senate, by unanimous voice vote, accepted the Annual Report for the academic year 1981-82 of the Committee on Graduate Studies, after agreeing by consensus to consider later in the meeting the proposal to establish a new graduate program in Medical Information Sciences and after deciding, on a divided voice vote, to defer action on the reviews of the Biophysics and Neurosciences programs pending the receipt of documentation on those reviews from C-GS.

Professor Paul Robinson, chairman of the Committee on Graduate Studies, presented his report (which was published in the *Campus Report* on Wednesday, Oct. 13, 1982) in three sections: report items, actions already taken by the Senate on the recommendation of C-GS, and items being presented for action at the current Senate meeting.

The C-GS report was commended for being admirably concise and to be emulated in that respect. Questions for clarification were asked and answered concerning certain of the policy recommendations, but Dean Lieberman pointed out that the policy matters reported by C-GS were not action items for Senate approval but, rather, matters within the purview of C-GS itself.

Discussion then turned to the programs which had been reviewed and recommended for extension by C-GS. The Honors Cooperative was reviewed at the initiative of C-GS and is not considered to be a program like the three other academic degree-granting programs. Of those three, only the Cancer Biology program had a Senate-stipulated review date. That review was acted on by the Senate last spring when it voted to extend the Cancer Biology program until 1984-85. The Biophysics and Neurosciences programs had no stipulated review dates when first established and have been functioning as continuing programs for a number of years.

Information was sought about the procedure followed in these program reviews, and particularly about whether or not the committee considered the legislative history of the program and the questions raised in C-GS and in the Senate at the time the program was established. Dean Lieberman responded that he felt all interdisciplinary graduate programs, even those established without a stipulated review time should be put on a formal review cycle. Review committees are formed, he said, from faculty essentially outside the program, and are charged to take a fresh look at its purposes, practices, and success. Such committees may or may not go back into Senate history. The final review report is discussed in a C-GS meeting in which the Director of the program and the Chairman of the review committee participate. After those guests depart, C-GS discusses the report and makes a decision.

Following Dean Lieberman's explication, there was discussion of the Senate's role in the review and in the extension of such programs. If the Senate's role is a serious one, it was argued, and Senate endorsement is required periodically for the continuation of a program, then Senate decisions must be made on the basis of more complete information than a simple recommendation of renewal. On the other hand, if reservations expressed when a program is initially authorized or reviewed are lost in time and not considered in a later review, then such discussions are futile and important concerns are ignored.

The Senate was reminded by President Kennedy and Chairman Fetter that the mechanism to prevent that loss of information is available. The chair of C-GS in the future need only request from the Academic Secretary a legislative history of the program's initial authorization and any subsequent review by the Senate. It should be standard operating procedure to start a program review with the questions raised in the Senate whenever that program was discussed in the past. It was pointed out, however, that the success of such an institutional memory depends critically on records which are sufficiently detailed to trigger the right questions.

Discussion resumed on the role of the Senate in reviewing interdisciplinary graduate programs. It was made clear that such programs, in recent years, have been mandated by the Senate with "sunset" clauses, i.e., a stipulated date for review. Programs established earlier do not have mandated review schedules, and the Senate is now being asked to assume an oversight function for them as well, since all such programs are expected to come under periodic review in the future.

Chairman Fetter pointed out that this procedure parallels that being followed now by C-US as it reviews interdepartmental undergraduate programs. There the intent is to provide sufficient documentation to give the Senate some sense of what was done in the review along with the C-US recommendation concerning that program.

Discussion followed concerning the type and amount of information most useful to the Senate in acting on these projected graduate program reviews. It was agreed that the same review summaries provided the C-GS, together with the appropriate "expert witness" guests (e.g., the Director of the program and the chairman of the review committee) should provide adequate background for Senate action. The further suggestion was made that in the future such reviews should ideally come before the Senate in some ordered fashion so that the Senate retains an impression of the total picture of graduate interdisciplinary programs. Such a procedure would help to monitor possible overlap in programs overlaid across disciplines.

2. Proposal for Graduate Degree Program in Medical Information Sciences

The Senate approved, by unanimous voice vote, the proposal to establish a new graduate program in Medical Information Sciences, to begin in 1982-83 and to be reviewed in its fourth year, 1985-86.

Dr. Edward Shortliffe, assistant professor of medicine and computer sciences, presented the proposed, outlining the history of Medical Information Sciences (MIS), the history of the proposal, and the nature of the proposal curriculum. He emphasized the strong interest in MIS and the need for a formal curriculum, as well as the impressive range of MIS research already identified with Stanford. The five major categories of course work in the program highlight some of Stanford's particular strengths. These include: 1) basic medicine and clinical enviromments. 2) computer science. 3) decision-making. 4) medical computing, and 5) health policy and social issues.

In the discussion that followed, it was made clear that the MIS courses were intended to attract nonmajors as well as majors, while at the same time having as the primary focus the training of specialists to integrate the disciplines of medicine and computer sciences. To the suggestion that information sciences intersect a great many disciplines without necessarily justifying separate degree programs, Dr. Shortliffe responded that the intensity of the traditional medical training prohibits the acquisition of these information sciences skills en route. This program specifies the crucial computer science theory courses as taught at Stanford and supplements them with medical applications and other integrating courses. To the comment that the program was very attractive for a dual degree, but seemed inflexible and prohibitively heavy, Dr. Shortliffe replied that it was indeed rigorous, but similar programs had been completed by himself and others. He added that a seven-year MD/PhD program, which this is expected to be, is now common.

It was pointed out that the required courses listed for curriculum category five would not satisfy one of its intents, i.e., to become familiar with key issues in. . .ethics. In order to be truthfully represented, a program should require the courses which would develop the required skills, in this case, for example, a course in medical ethics. Optional courses indicate recommendations, not requirements.

Three other caveats were given: increasingly narrowed specializations for PhD programs represent a dangerous trend; the endorsing letters from outside Stanford cannot all be read as supporting the establishment of a degree program since most were written to endorse the need for a coordinating committee; one faculty member listed as contributing to the program is no longer at Stanford. Dr. Shortliffe agreed that the outside letters were obtained early in 1981 before the formal curriculum was developed and, to the last point, responded that a faculty replacement had already been arranged for, both on the committee and in the course offerings.

In response to a question from Chairman Fetter, Dr. Shortliffe replied that the sponsors would prefer to have the program begin in 1982-83 to accommodate transfer majors within Stanford. Outside applicants would not be enrolled until 1983-84.

3. Senate Resolution for C-GS Proposal

Professor R. Street moved the following resolution, as amended by Professor K. Arrow:

Resolved: That C-GS consider drafting sunset legislation for graduate interdisciplinary programs which proposes the review procedure, specifies the Senate's role in the review, and sets the future schedule for those reviews. That proposal should be submitted to the Senate for approval.

The resolution was approved by unanimous voice vote.

The Senate also heard a number of reports on which action was neither sought nor taken.

1. Report of the Steering Committee

In the Report of the Steering Committee, Chairman Fetter began with a plea that members of the Senate come to Senate meetings on time so that the meetings can begin promptly. This should ease the problem of unduly long waits for invited guests before they can present their reports, and will help to ensure a quorum if action is to be taken later in a meeting. He reported that the Steering Committee is currently drawing up *Guidelines for Reports and Proposals to the Senate* with the intent of assisting the chairs of committees to provide in concise form only that information necessary to the Senate for arriving at a decision. He called attention to the items tentatively scheduled for consideration on future Senate agenda. These include reviews of interdepartmental undergraduate programs and of the Overseas Studies Program, Annual Reports of Academic Council committees for 1981-82 (C-AAA, C-CIT, C-Lib, C-Res, and C-US), the Long Range Financial Forecast (12/2/82) and the Operating Budget Guidelines (3/3/83), and a report from the Dean of Humanities and Sciences which will be scheduled for spring quarter.

2. Report of the President

President Donald Kennedy reported on matters related to the strike. The text of his report appears on page of this issue of *Campus Report*.

In comments made following the report, the administration was both commended for respecting the conflicting needs of all constituences in the University and cautioned not to forget the crucial contributions made by workers in freeing the students to learn, especially in their services to residential education.

3. Report of the Provost

Provost Albert Hastorf reported that, since the Director of the Stanford University Press, Leon Seltzer, plans to retire at the end of this academic year, a search committee has been appointed to nominate his replacement. The Committee will be chaired by Professor G.L. Bach; other members will include Professors W.P. Falcon, P. Suppes, G.J. Lieberman, T. Grey, and W.M. Chace.

He also reported that the Mellon Foundation had given Stanford a grant of $50,000 to support the publication of books by young scholars in the Humanities. The Humanities Center, now in its temporary quarters, is beginning to flourish, and the Mellon Foundation has granted Stanford $250,000 to be matched by the University through fund-raising so that the total half-million can be used for fellowships at the Humanities Center for junior faculty. The University had already converted an unrestricted gift of $500,000 by the Weeks family to be a half-million-dollar expendable fund over ten years to provide support for the Center, which is directed by Professor Ian Watt.

The Mellon Foundation has also recently announced the establishment of a fund to provide 100 fellowships per year for graduate students in the Humanities. These are portable fellowships which will pay tuition plus approximately $7,000, and may even include the possibility of one year of study as a "guest student" at another institution.

In concluding his remarks, the Provost reported that the Board of Trustees has approved the move of Stanford's campus in England from Cliveden to Oxford. The new campus quarters will need to be refurbished, a process which will not be completed until the fall of 1984, one year after the Cliveden contract expires, so there will necessarily be a one-year gap in the program. Even so, the move promises to be rewarding, providing a more stimulating academic environment for both students and faculty.

4. Interim Report of the *Ad Hoc* Committee to Study the Length of Academic Terms

Professor Edwin Good, chairman of the Committee, presented the interim report, announcing that the final report can be expected soon. Although the committee was established in Oct. of 1981, the first student members were not appointed until late Nov. and the committee began its work in Jan. of 1982.

The final report will recommend no revolutionary changes. Several alternative academic calendars have been studied, including the quarter system, the traditional semester, and the early semester system more recently developed (now in use in over 50 percent of U.S. institutions of higher learning, including UC-Berkeley next year). The committee also studied a system proposed from inside

continued on next page

Senate/ continued from page 18

Stanford, principally by Professor G.H. Golub, chairman of computer sciences: a system of six five-week terms.

Each system is good for certain educational values and no system is good for all. This accounts for the decided split within the committee, principally along disciplinary lines. The committee of thirteen represented virtually all viewpoints. The size and diversity of the group seemed to foster the fragmentation of opinion.

Since it could not agree, the committe worked at possible combinations of term lengths, but found them too complicated. The Golub units particularly are conducive to such combinations, but they also seemed to result in excessively complicated systems that would weigh too heavily upon the advising system. Such combinations seemed likely to cause the proliferation of courses when consolidation and better articulation of courses is a more pressing need.

The committee may well recommend that more thought be given to articulation of the curriculum, to the various kinds of learning that must take place in different disciplines, and to the ways in which those kinds of learning can be enhanced.

The committee will probably urge departmental experiments to overcome the shortcomings of the quarter system, e.g., the greater use of two-quarter sequence courses that continue into but not necessarily through a second quarter.

In the discussion which followed the interim report, it was determined that the lack of a proposal for academic calendar change stems not so much from a majority of the committee overwhelmingly favoring the quarter system as from failing to find a viable alternative among the possibilities considered. Professor Good reported that the committee had studied the UC-Berkeley report on the academic calendar carefully, but noted that the situations here and there are different in that UC-Berkeley is switching back to the semester system after a forced shift to quarters. Such a move is obviously easier to make than it would be if semesters had never been the accepted system there.

In response to a question, he reported that the committee had not examined the problem of students taking too many courses with too few units each under the quarter system since, at least in principle, academic courses are to be offered for no fewer than three units each. He also replied to a question concerning the effect of the choice of academic calendar on the budget. It appears that the differences in costs would not be sufficiently great to tip the scales in favor of less frequent registrations.

Some evidence to support the Golub system was offered from the floor. It is apparently now in effect in at least part of the university system at Carnegie-Mellon. Others who have examined it closely have found it a very promising possibility for sciences and humanities alike. The recommendation was made that the committee describe the Golub system carefully in the final report so that the community can examine its potential.

As the discussion drew to a close, several comments were made about the perennially—recurring nature of the academic—calendar question and the need to retain good records of discussions and decisions for the benefit of those who must confront the problem when it reemerges at some future time.

There being no Unfinished Business, and no New Business being raised, the Senate adjourned on a motion made and seconded at 5:25 p.m.

Clara N. Bush
Academic Secretary

Kennedy comments on USW strike

Following are comments to the Faculty Senate by President Donald Kennedy.

As you know, the strike is over, a contract has been reached, and bargaining unit employees have returned to their jobs. While the hard work of contract negotiations is over, an equally important task remains: we must focus our efforts to restore the *quality* of our continuing, daily working relationships with bargaining unit employees at the University.

That is what ordinarily happens when a strike ends, and it is what I expect to happen now. There were, however, some particular characteristics of this conflict that might make the process of reconciliation more difficult than it ordinarily is. I want to talk about one in particular—because it seems to me central to an understanding of what actually happened here and why it happened.

In the course of this strike (and even before), U.S.W. in its leaflets and in the media criticized the University's contract offers by accusing the University of not bargaining in good faith. Obviously, our offers were not what the Union leadership hoped for. But they were realistic and fair, and were made in a determined effort to reach an agreement that would respect the needs of bargaining members without jeopardizing the University's responsibility and accountability for fiscal management or diminishing its ongoing and paramount commitment to academic excellence.

U.S.W. made numerous allegations in the media. For the most part we chose not to respond to those charges in kind. Nor did the University move significantly from its last offer. I was keenly aware during the strike that because of this the University's position was perceived by some to be unyielding. We said and we believe that contract terms must be negotiated at the bargaining table, not in the media. We also said and believed that our last offer, made before the strike was called, contained essentially all that the University could responsibly give. We are convinced that the same agreement would have been reached even earlier had the U.S.W. leadership continued serious negotiations at the bargaining table instead of calling a strike.

I am also convinced that it was more important to adhere to these principles than to avoid some risk that our conduct would be misperceived. By having said what we meant, and by having respected the bargaining table as the proper forum for settling contract terms, the University has set a good foundation for restoring quality working relationships to the campus, and I am confident we will be able to do so.

With contract negotiations behind us, we are now able to concentrate our energies on a separate matter of equal concern. These are troubled and unpredictable economic times, particularly for universities. In such times, extra care must be taken to manage the University's resources and affairs in a responsible manner. Contract negotiations concentrate on the short run, but the overall economic and academic concerns of the University reach into the long run. We tried responsibly to achieve a balance. I don't believe that any other course is possible and it is the course that I expect to guide us in the future, as well.

Board of Trustees report

Trustees approve relocation of Stanford's British campus at Oxford

The Board of Trustees took the following actions at its meeting on October 12, 1982:

1. Approved actions already taken by the Office of the Vice Provost and Dean of Graduate Studies and Research to enter into contracts and grants for research for the month of August, 1982, totalling $19,414,685. The monthly average of such awards for the twelve-month period ending August 31, 1982, was $13,290,070 compared with $13,689,730 for the corresponding period the year before.

2. Accepted gifts received during the month of September, 1982, totalling $3,845,306.

3. Accepted statements that.

a. The Operating Budget for 1981-82 has been adjusted by offsetting equal items of income and expenditure totalling $1,167,000.

b. The Operating Budget for 1982-83 has been adjusted by equal items of income and expenditure primarily because of implementation of planned budgetary reductions of 1 percent.

c. The balance of the Operating Budget Reserve was $2,695,000 on August 31, 1982, and is projected to remain that at the end of the fiscal year on August 31, 1983.

4. Elected John T. Packard to a five-year term as Trustee.

5. Authorized the investment of $1,000,000 in Continental Capital Ventures B.

6. Authorized the investment of $3,000,000 in Kleiner, Perkins, Caufield and Byers IV.

7. Authorized the investment of $2,000,000 in Charles River Partnership IV.

8. Received the annual report on outside properties.

9. Received the annual report of the University's portfolio of securities.

10. Heard a report on improvements in parking and in the circulation of traffic at the Stanford Shopping Center.

11. Approved the transfer of the balance in the Meyer-Buck Maintenance Fund from funds functioning as endowment to expendable funds.

12. Authorized the Vice President for Business and Finance to execute an unsecured note to one or more banks for an amount not to exceed $10,000,000, the proceeds from which will be applied to capital acquisitions which support sponsored agreements.

13. Established the Marta Sutton Weeks Fellowships at the Stanford Humanities Center.

14. Authorized the transfer of funds in the Tarweed-Stanford Fund to an expendable fund to be used for a new field for field hockey.

15. Approved the Budget for 1982-83 of the Stanford University Faculty Practice Program.

16. Regarding the relocation of Serra House:
a. Approved the concept, project, and site.
b. Authorized a total budget of $696,000.
c. Authorized the Vice President for Business and Finance to complete documents for design, put the work to negotiated or competitive bids, and proceed with construction provided costs are within budget and funds are available.

17. Approved the relocation of the Stanford Study Center in Great Britain from Cliveden to Oxford.

18. Heard an oral report on the capacity of the University to carry debt.

19. Received a status report on all construction on campus.

20. Regarding Stanford West:
a. Approved the concept of and site for the residential development known as Stanford West.
b. Approved an increase of $1,115,000 in the total budget, from $1,250,000 to $2,365,000.
c. Approved funding the $1,115,000 as an interim advance against future income from the project, with backstopping by proceeds from the project at Peter Coutts Hill if Stanford West does not go forward.

21. Heard a report on planning for fundraising connected with the University's centennial year.

22. Heard a report from Arthur I. Bienenstock, professor of applied physics and director of the Stanford Synchrotron Radiation Laboratory (SSRL), on development of the laboratory and the research being performed there.

23. Heard a report from Ferdinand A. Geiger, director of athletics, physical education, and recreation, on "Athletics at Stanford."

Faculty appointments, promotions

On October 12, 1982, the Board of Trustees made the following appointments, effective September 1, 1982, unless indicated otherwise:

PROMOTIONS:

David A. Clayton, professor of pathology, effective 11/1/82; Richard L. Goode, professor of surgery, effective 11/1/82.

REAPPOINTMENTS:

Malcolm F. Anderson, assistant professor of radiology, 9/1/83; Paula M. Duke, assistant professor of pediatrics; Michael P. Link, assistant professor of pediatrics; Alan M. Litke, assistant professor of physics; Ronald C. Merrell, assistant professor of surgery; David K. Stevenson, assistant professor of pediatrics; Karl A. Van Bibber, assistant professor of physics.

APPOINTMENTS:

Karol Berger, associate professor of music; Luis Caffarelli, professor of mathematics, effective 9/1/83; Michael Hendrickson, associate professor of pathology, 11/1/82; Norman J. Lewiston, associate professor of pediatrics, 11/1/82; Gregory J. Lynch, assistant professor of art, 10/1/82; Ernst W. Mayr, assistant professor of computer science; Michael F. Ramsaur, associate professor of drama, effective 10/1/82; Debraj Ray, assistant professor of economics, 10/1/82; Stephanos Venakides, assistant professor of mathematics; Andrew C. Yao, professor of computer science, effective 10/1/82.

REPORT MATTERS:

Frederick S. Hillier, professor of operations research, appointed associate chairman of the Department of Operations Research, 9/1/82 to 8/31/85.

Charles S. Williams, associate professor of electrical engineering, appointed associate chairman of the Department of Electrical Engineering, 9/1/82 to 8/31/83.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

29253-JB (JCC:2120) ACCOUNTANT I: Manage resources (funds & equip't inventory) for both a set of res projs & an academic dept; meticulous real-time budget acctg, budget setting & reliable projections very important; timly mgmt of funding requests & delivery of results both budgetary & technical; prov quantitative basis for, & take part in, continuing decision making on resource allocation; manage all interactions w/ off-campus financial support organizations & w/ on-campus res coord groups & academic budget people; QUALIFICATIONS: formal acctg training; college degree in business (or engrg) desirable; several yrs exp involving resource acctg, preferably related to mgmt of tech projs; track record of prompt & accurate proj status keeping & projection; willingness to develop & maintain effective means for mgmt use of projections.; C05; $1670-2086.

33697-VW (JCC:2160) ACCOUNTANT II: Act as Credit Collection Mgr; respon for the credit & collection functions of Faculty Practice Program; plan, organize, dir & evaluate credit & collection activities; represents FPP Asst Dir for Patient Accts in credit & collection matters & performs other duties as required; supv a staff; coord w/ physician & other FPP mgrs; QUALIFICATIONS: bachelor's degree desired; 1-3 yrs supvry exp nec; exp in credit & collection activity also required; prior exp in either hospital or physician group practice setting desirable; must possess the ability to function in a highly complex & dynamic environ.; C06; $1854-2312.

32936-TC (JCC:5050) PROGRAMMER SYSTEMS III: 50%; work for Day Care Ctr (Clinic) in Div of Oncology; handles a large patient volume & active clinical protocols; respon for maintenance & development of UNIX PDP-11 Sys Software; design data base applications software to users specification retaining integrity of operating sys; optimize the performance of appl programmers embedded in UNIX; respon for large oncology data base; ability to make decisions w/out peer support; ability to advise non-computer oriented physicians & physicists; QUALIFICATIONS: Master's degree desirable and/or applicable exp.; C07; $1057-1362.

27086-PM (JCC:2554) SECRETARY II: Fixed term for 1 yr with possibility of extension; full range of sec'l suport for Sr. Fellow working on economics of public finance (50%) & to Sr. Research Fellows & Scholars (50%); typ corresp, articles, & manuscripts in draft & final form, primarily on Word processor & often fr taped dictations; travel arrangements & calendar; phones & mail; setting up & maintaining files; expense reports & other univ forms as required; QUALIFICATIONS: typ 60; excel typing skills; high-level ability to use word processing equip't & heavy transcription (for taped dictation); send appl/resume to Dr. Charles E. McLure, Jr., Hoover Institution, Stanford, CA 94305; please do not telephone; B11; $1246-1310.

29437-PM (JCC:2454) OFFICE ASST II: Fixed term 11/15/82-5/31/83; assembly of application mat'l for MBA Program into file folder; work w/ confidential mat'ls daily; verifying requested mat'ls to be accurate, authentic & complete in folder; retrieving GMAT scores; completing data processing form; calculating GPA's; notifying applicants fo missing credentials or completeness of folder; help to answer 4-line phone sys; prov assistances for other desks in 5-person offc as work load demands; QUALIFICATION: type 40; accuracy & atten to detail essential; good math skills & ability to use calculator; command of oral & written English essential; knowl of Stanford & college admissions helpful; send appl/resume to Cecilia Strickland, GSB or call 497-2766.; B09; $1130-1189.

25868-PM (JCC:2596) SECY II-SPEC: work as faculty sec for law professors as assigned to handle all classwork needs corresp, expense reports & travel arrangements; answer phones, xerox, & at time, cut & paste for pre-publication; QUALIFICATIONS: typ 70+; excel typing skills; familiarity w/ dictation/transcription sys essential (s/h a plus); some prev business exp or law offc exp preferred; able to work under extreme pressure, esp related to publishing deadlines; must be detail-oriented & have shown demonstrated ability for making respon judgments & setting own work prior; will train on computer/-word processor equip't as needed; send appl/resume to Dena Landsman, Rm 113, Crown Quad, Law School.; B12; $1310-1373.

SLAC

94633-JM (JCC:2562) SECRETARY III: Perform a wide range of sec'l & admin duties incl but not limited to typing letters, maintaining file sys, screening mail, handling periodic heavy corresp related to hiring of Res Assocs; prov support for spec lab committee mtgs; typ tech mat'ls using Physics terminology; record data on word processor; schedule appts; arrange travel, etc; QUALIFICATIONS: several yrs appl exp; typ 50-60 w/ excel knowl of spelling, grammar & punctuation; some exposure to use of word processor; ability to do tech typing or willingness to learn; exp w/ dictaphone and/or s/h helpful; excel admin/organizational skills; ability to commu w/ large number & variety of people.; B14; $1440-1593. APPLY AT SLAC

95159-JM (JCC:6612) PR S&E TECH - ELECTRO MEC: TMS Unit; construction & testing of experimental equip't in clean rm area; develop't of procedures & equip't nec to manufacture Planar Spark counters; supvn of others during manufacturing phase; design, construct & troubleshoot electronic circuitry; quality control of components; interface w/ vendors; QUALIFICATIONS: AA degree or equiv; excel mech skills required at both design & fabrication level; requires highest standards in precision; some exp in clean rm area; supvry exp desirable; familiarity w/ modern control sys & ability to apply them as an integral part of mech sys & equip't being developed; exp using standard fast electronic test equip't.; A39: $2148. APPLY AT SLAC

Nonexempt

29441-PM (JCC:1747) LIBRARY SPEC I: 75%, nights/wkends flexible as needed; charges outreserve books & other circulating mat'ls; prov genl informa to lib users; issues lib cards, registers patrons, monitors eligibility of the public for access to lib & for borrowing; interprets & carries out lib policies & procedures; answer phones; searches for mat'ls for Public Services use; collects fees & fines; opens & closes lib as assigned; may asst w/ simple computer files & machine memory sys; QUALIFICATIONS: ability to work w/ public in an efficient, calm, mature & always courteous manner; ability to follow specific procedures & carry out instructions; exp in interpreting & carrying out detailed, written policies; phone answering skills; able to remain on feet for better part of the day; lib exp major advantage; send appl/resume to Karen Kieffer-Gillette, Jackson Lib, GSB, Rm 119, 497-2162.; B10; $892-935.

30970-PM (JCC:1747) LIBRARY SPEC I: 75%, 8-3; performs duties in Catalog Dept; files in Main Catalog; validates access points while filing; does authority work for heading changes in SUL catalogs; files in Spec Collections & Reference Room catalogs; pulls catalog records for cancelled books & changes location stamps for transferred books; QUALIFICATIONS: typ 40; require atten to detail; ability to learn filing rules & file structures of a large, complex catalog sys; ability to learn guidelines for authority work; prev cataloging exp in filing & searching; some bkgound in foreign langs, preferably European; prev proof or other editorial work exp; send appl/resume to Bob Johnson, Green Lib, Room 223, 497-3152.; B10: $892-935.

30886-PM (JCC:1763) LIBRARY SPEC III: Supvn & continuous training of 3 lib specs; monitoring daily input of cataloging records in RLIN; organization of work flow for tech processing; final respon for tech correctness of database records & catalog cards & distribution of them to approp files; final respon for accuracy of filing in lib's public catalog; maintenance of shelflist records for continuing publications; collection & compilation of monthly bibliographic statistics; QUALIFICATIONS: prev lib exp in tech serv; typ 60; ability to follow & learn new elements introduced in lib's automated sys as well as lib's procedures; ability to work effectively & commu clearly; knowl of any Western European lang useful; contact: Eliska Ryznar, Law School Lib, Rm 258B.; B14; $1440-1514.

30972-PM (JCC:1771) LIBRARY SPEC IV: Performs duties in Gov't Documents Dept; respon for day-to-day mgmt of tech processing activities; acquisitions of federal documents, both manually & on-line; processes federal monographs & serials using LC & superintendent of Documents classifications, both manually & on-line; claims mat'ls; processes invoice; does binding; supv 3.5 FTE lib specs in tech processing activities; prov min of 5 hrs/wk of reference assistance to patrons, etc; QUALIFICATIONS: typ 40; require prev lib exp, prev exp in tech processing, incl cataloging & searching; prev supvry exp; prev exp w/ automated sys, preferably RLIN; ability to commu clearly, both orally & in writing; lib reference exp; knowl of or exp w/ govt. organizations & publishing activities; contact: Bob Johnson, Green; B16; $1593-1671.

44398-BP (JCC:2454) OFFICE ASST II: 50%; fixed term 11/1/82-7/31/83; gradually increase to full time before/during commencement; respon for very detailed activities in prep of diplomas & the Commencement Bulletin; coding data & data entry on IBM terminal; ordering & checking lists & reports fr Commencement Computer file; proofing diplomas & assisting in production of Commencement Bulletin; mailing out diplomas; sorting & distributing diplomas for dept'l ceremonies, etc; QUALIFICATIONS: typ 45; prev data entry exp desired; atten to detail; high degree of accuracy; good organizational abillty; ability to work under pressure & w/in strict deadlines; send appl/resume to Glenda Greer, Rm 133, Old Union, 497-1550.; B09; $565-595.

30409-BP (JCC:2462) OFFICE ASST III: Act as bkup receptionist; heavy traffic; must explain & interpret grad div procedures & interpret financial aid, registration & other policy matters; respon for approving all student res & teaching assistantships; confers w/ depts & interprets for them regulations & policies dealing w/ problem cases; respon for processing Postdoctoral Fellows folders; asst in College Work Study program; determine student's eligibility to be included in FISAPP grid; maintain file on available outside awards; write to foundations for update; asst in ordering all fellowship stipends; QUALIFICATIONS: accuracy in math & typing; work under pressure & w/ many interruptions; use of computer terminal, typewriter & xerox machine; may not smoke in offc; send appl/resume to Karlene N. Dickey, Bldg 590,; B11; $1246-1310.

44400-BP (JCC:2462) OFFICE ASST III: Respon for coord all spec registrations & act as interface w/ students, faculty, & staff regarding registration information; an informa'l source on Univ policy & procedures; prov informa on grad student registration status to students & staff; organize & coord w/ depts for Advance Registration & Class List Sign-up; respon for the Summer Session registration; act as registration liaison for spec student programs; handle late registration for Post-docs & TGR students; hire & supv temporary hrly employees, etc; QUALIFICATIONS: typ 40-50; requires strong organizational ability & accuracy; ability to commu well w/ people; some college work or exp in academic setting helpful; ability to work effectively under pressure; send appl/resume to Glenda Greer, Old Union, Rm 133.; B11; $1246-1310.

30782-BP (JCC:2470) OFFICE ASST IV: Prov sec'l, clerical & admin support to Energy Program Offc staff; handle all details of day-to-day running of the offc; answer phone; screen calls; sort mail; order equip't & supplies; type letters, memos & reports using typewriter & word processor; maintain informa file on computer; maintain records of expenditures & accts for offc budgets & reconcile monthly budget statements; res facts on energy conservation, etc; QUALIFICATIONS: typ 60; good oral & written commu skills; able to work w/ numbers & detail accurately; knowl of Univ procedures & forms desirable; knowl of or willingness to learn word processing & Wylbur, SPIRES computer commands; send appl/resume to Nancy Teater, 127 Encina Commons.; B14; $1440-1514.

30971-PM (JCC:2554) SECRETARY II: Performs duties in Spec Collections Dept; type corresp, reports, guides, memos & exhibit texts; maintains files; orders supplies; picks up mail; keeps selected statistics; greets visitors & patrons; supvs the registration of patrons; monitors the Lurie Rotunda & gallery area; serv as dept chief's sec; answer calls; QUALIFICATIONS: typ 50; require prev sec'l exp; prev public serv exp; ability to use transcribing machine; ability to learn Wylbur or another text-editing sys; thorough knowl of and/or accuracy in use of English grammar, spelling & syntax; good commu skills, both orally & in writing; some knowl of libs' structures & operations; send appl/resume to Bob Johnson, Green Lib, Rm 223, 497-3152.; B11; $1246-1310.

33778-BP (JCC:2562) SECRETARY III: Prov full range of sec'l duties for 2 Financial Mgrs w/in Real Estate Dept; rec & scr calls & visitors; arrange mtgs; open & scr mail; typing of corresp, reports, forms; compile financial reports, data on sales; loans, interest; set up & maintain filing sys; make travel arrangements; prep expense reports; may require maintaining records pertaining to expenditures for budgets & reconciling budget statements; heavy volume of work on Datapoint word processing sys; QUALIFICATIONS: TYP 65; min 3 yrs' sec'l exp; detail oriented; excel commu in writing & orally; knowl of Datapoint word processing desirable; able to use 10-key calculator; excel math skills; send appl/resume to Pauletta Sypert, Investment Mgmt Organization, 209 Hamilton Ave., Palo Alto, CA 94301.; B14; $1440-1514.

Bargaining unit

14294-PB (JCC:7316) FOOD SERVICE WORKER III: TMS Unit; W, Th, F, 6-2pm; Sat & Sun, 11-8pm; prep fruits & salads for buffet, a la carte salads or sandwiches during lunch, hors d'oeurvres for spec parties; food prep for banquets on Sat; food prep for buffet on Sun; QUALIFICATIONS: 2 yrs exp in restaurants, hospitals, hotels or w/ a catering serv required.; A12; $6.54.

14295-PB (JCC:7316) FOOD SERVICE WORKER III: TMS Unit; Mon, Tues, 6-2pm; Fri, Sat, Sun, 11-8pm; prep fruits & salads for buffet, a la carte salads or sandwiches during lunch, hors d'oeuvres for spec parties (makes jello molds, fruit & relish trays & various salads & dressings); food prep for banquets on Sat; food prep for buffet on Sun; QUALIFICATIONS: 2 yrs cooking exp in restaurants, hospitals, hotels or w/ a catering serv required.; A12; $6.54.

14296-PB (JCC:7316) FOOD SERVICE WORKER III: TMS Unit; Mon-Fri, 11am-8pm; works fry station during lunch, broiler and/or saute station during dinner; grill steaks, prep hot & cold food for table serv; in afternoon helps prep of Ala Carte & banquet foods; 2 yrs cooking exp in restaurants, hospitals, hotels or w/ a catering serv required.; A12; $6.54.

32392-PB (JCC:5835) ANIMAL CARE ASST I: 50% TMS Unit; Mon/6 hrs, Wed/8 hrs, & Fri/6 hrs; respon for animals (rats, mice) housed in the animal care facilities; clean cages, feed & water, perform genl cleaning of areas; sterilizes cage equip't, bottles, & sawdust; QUALIFICATIONS: ability to follow very detailed verbal & written instructions; habits of cleanliness & neatness; willingness to handle animals; familiar w/ animal facility & use of autoclave; has to handle 25-30 lb bags of feed; able to work where there is sawdust.; A12; $6.54.

Ph.D. oral exams

TUESDAY, OCTOBER 26

Philippe R. Spalart, aeronautics and astronautics, "Numerical Simulation of Separated Flows," 4:15 p.m., Skilling Auditorium.

WEDNESDAY, OCTOBER 27

Mark Nunan, French and Italian, "The Poetic Genesis of Francis Ponge," 2:15 p.m., 274, Bldg. 260 (French Dept).

THURSDAY, OCTOBER 28

Radley Wahl Olson, chemistry, "Spectroscopic Studies of Molecular Interaction Dynamics in Mixed Molecular Crystals," 2:15 p.m., Chemistry Gazebo.

FRIDAY, OCTOBER 29

James Harris, English, "American Poetry, 1850-1960," 2:15 p.m., Bldg. One, Room 2N. **Christine Sierra,** political science, "The Political Transformation of a Minority Organization: The Case of the Council of La Raza, 1965-1980," 10 a.m., Political Science Faculty Lounge.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, Oct. 26, in room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Mid Schubert and Terre Harris with their stuffed gingerbread men.

Staffers, coaches strut their finest

Stanford staff members and coaches, Dollies and other students, and assorted alumni will serve as models for the Saks Fifth Avenue fashion show which will be part of the Chrysanthemum Party and Golden Boutique, scheduled for 1-5 p.m. Sunday, Oct. 24, at Syntex (401 Hillview Ave., Palo Alto).

Among the models are: David Voss, house manager at 623 Mirada; Mark Olson and Carolyn Manning of the Alumni Association; associate athletic director David Glenn, coaches George Haines, Chris Harpell, Skip Kenney, and Jean Helliwell, and trainer Cathy Egan of the Athletic Department.

The day's events will also include a tea dance with the Stanford Jazz Band and a boutique sale featuring items made during the year by Mother's Club members worldwide.

There will also be singing by the Mendicants and television sets for football fans to watch the day's games.

The Chrysanthemum Party is the Club's main fundraiser for its scholarship fund. Tickets are $6 at the door.

Peter Coutts Hill condominiums

Stanford University is accepting applications now for rental of the new Peter Coutts Hill Condominiums.

Rental units will be available in December, 1982. Rental agreements, are month-to-month.

Preference in rentals will be given to members of the Stanford community (faculty, staff, students, etc.) and its affiliates. Families with children are welcome.

Floor plans of the various unit types and rental applications are available from the Peter Coutts Hills rental office, 138 Peter Coutts Circle, Stanford, Calif. 94305; (415) 493-1471.

The unfurnished average rents for the various types are as follows:

A-1	(2br/2ba)	$930
A-2	(2br/2ba/study)	$1,010
A-3	(2br/2ba/study)	$930 (handicapped unit)
B	(2br/2ba/study)	$985
C-1	(3br/3ba)	$1,095
C-2	(3br/3ba/study)	$1,200
D	(3br/3½ba/study)	$1,260

These are average monthly rents. The actual rent on any particular unit may vary slightly according to unit location. Additional rent of $50 per month will be charged for each unrelated adult in excess of one per unit.

Flu vaccinations offered staff

Stanford will provide influenza vaccinations again this year at no charge to all employees who wish them.

Immunization will be available from 1:30 to 4 p.m. Fridays at Cowell through Nov. 12.

The vaccine is recommended only for certain high-risk individuals—those with heart disease of any kind, chronic lung disease, chronic kidney disease, diabetus mellitus or other chronic metabolic disorder, chronic severe anemia, and conditions which compromise the immune mechanism, including cancer therapy.

Older persons, especially those over 65, should get the immunization.

This year the flu vaccine will include three types: A-Brazil, A-Bangkok, and B-Singapore. It will not contain swine flu. Adults and children over 13 will require only one dose.

Rental housing

HOUSING NEEDED

□ **Dec. '82 to Mar. '83:** Want to rent 2BR or more, furn. condo or hse. Call collect (714) 752-7870.

□ **Jan. to July '83:** Johns Hopkins Prof., visiting SLAC, seeks hsng. for self, wife & 12-yr-old child. 2 or more BR hse or condo nr campus & schls. Will EXCHANGE spac. 5BR hse in Roland Pk., Baltimore, walk dist. excl. priv. schls. Call collect (310) 366-1892 or Gwen Bowen, SLAC, (415) 854-3300, ext. 3111.

□ **Jan. to June '83:** Visit. Fac. Grad. Sch. of Bus., wife, son, and obedience trained standard poodle seek hse or apt, 3BR, in Palo Alto Sch. Dist. Call collect (203) 387-4010.

□ **NOW:** Resp. prof. cpl. seek rental hse, 1 yr. lease. No children. Palo Alto, West Menlo, Mt. View. Call between 6 & 9 pm, (415) 349-9794.

□ **NOW thru end of Jan. '83:** Chief exec. officer of loc. corp. seeks 4-5BR furn. hse. immediately. Call J. Lange. Stanf. Alum. Assoc. 497-2021 or 321-4961.

□ **Winter Qtr:** Short term rental for parents of Stanf. prof. Any time during qtr.—Jan.-Mar. Nonsmoking, no children or pets. On or nr. campus. Call Mary or John Felstiner, 322-7727.

Need rider from Los Gatos/Saratoga area arriving at Stanford 7:30 a.m., leaving 4:30 p.m. Call Gloria, 497-4970.

Bowen to conduct Jazz Band Friday

The Stanford Jazz Band will begin its 1982-83 series with a concert on Friday, Oct. 29, at 8 p.m., in Dinkelspiel Auditorium.

The program, billed as "The Big Band Era," will offer an evening of favorite melodies from such jazz immortals as Count Basie, Duke Ellington, Woody Herman, Les Brown, and Glenn Miller.

Under the supervision of Professor Arthur Barnes, the band will be conducted by its new student director, Jose Bowen.

Bowen, a native of Fresno, is a junior in history and biology who manages in his spare time to maintain an active musical schedule as both conductor and composer. This past spring he was awarded the $1,500 Bill T. Ritchie Scholarship from the Fresno Musical Club, enabling him to spend the summer completing his Concerto for Flute and Strings, op. 34. The work received its premiere performance at Fresno State University in September.

Tickets to the Jazz Band concert are $4 general admission and $2 for students and senior citizens, and are available at Tresidder ticket office, 497-4317 or at the door.

Animals topic of Raubitschek talk

Emeritus Prof. Antony Raubitschek of the Stanford Classics Department will give an illustrated lecture on the exhibition, *Animals in Ancient Art from the Leo Mildenberg Collection*, at 3 p.m., Sunday, Oct. 31 in Annenberg Auditorium.

The Mildenberg Collection consists of approximately 200 ancient works of art depicting animals, created by artists in the near East, Egypt and the Classical World. Included in the exhibition are miniature animal figures in gold, terra cotta and glass, and small earthenware vessels shaped like animals or decorated with animal designs.

This unique, private collection of exquisite objects has been assembled by Dr. Mildenberg, a director of Bank Lev in Zurich and one of the world's foremost authorities on ancient coins. The exhibition may be viewed at the University Art Museum, Berkeley, from Oct. 13 through Dec. 5, 11 a.m. to 5 p.m., Wednesday through Sunday.

This lecture, sponsored by the Committee for Art at Stanford, is open to the public at no charge.

Michele Marieschi painting in Art Gallery exhibition

Painting and drawing, furniture, and crafts of Venice shown at Gallery

Venice of the 18th century as reflected in the work of its artists and craftsmen is the theme of an exhibition to be held at the Stanford University Art Gallery through Dec. 19.

Drawn largely from the important collections of Venetian art of the Stanford Museum, the exhibition features works by Guardi, Canaletto, Bellotto, Piranesi, and the Tiepolos, as well as a selection of the arts of decoration, furniture, glass, and lace for which Venice was famous.

The connection between art and life was especially close in Venice during that period of its final glory when it rivaled Paris as a center of elegance. The city itself was considered a work of art, and the painters of Venice untiringly represented it in all its aspects, as the section of the exhibition devoted to views of Venice demonstrates.

But the life of Venetian society, considered the most liberal and self-indulgent in all Europe, gave an almost equal opportunity for the amusement and observation of artists. The pageantry and lively drama of the great sea-borne city, played out on an incomparably beautiful stage, inspired a form of art that was at once grandly monumental and intimately suggestive of enjoyment. It found its culmination in the work of the Tiepolos, father and son, of which the exhibition contains notable examples.

The diversity of the exhibition, ranging from painting and drawing to the characteristic painted furniture of 18th century Venice, and including a sampling of Venetian mirrors, decorative glass, and lace, is designed to illustrate the unity of style and spirit that marked Venetian civilization in its last flowering, before the Revolution, Napoleon, and Austrian occupation put an end to the independence of the city and to its culture.

A manuscript page, in Mozart's hand, of a passage from *The Marriage of Figaro* is a reminder of the rich musical life of Venice and of the fact that the opera's librettist, Lorenzo da Ponte, was a Venetian.

The Art Gallery and Museum are open Tuesday through Friday from 10 a.m. to 5 p.m.; Saturday and Sunday from 1 to 5 p.m.; closed on Mondays.

Translators to meet at Stanford

The American Literary Translators Association will hold its fifth annual meeting Friday through Sunday, Oct. 29-31, at Stanford University.

Registration will be held from 5-7 p.m. Friday, Oct. 29, at Tresidder Union, followed by a poetry reading by Robert Duncan. Further readings will be given at 2 p.m. Sunday by Nobel Laureate Czeslaw Milosz, Robert Hass, and Robert Pinsky.

Panels and informal discussions have been scheduled on reviewing, translation as interpretation, creating an audience for translation, translation theory and practice, sound in poetry, translating for the theater, a women's roundtable, and workshops in Spanish, German, French, Swedish, Hebrew, and Yiddish, and bridging in Chicano literature.

The various programs will be free and open to the public. Consult the posters around the campus for the detailed schedule.

The Pocket Opera of San Francisco, directed by Donald Pippin, will perform at 9 p.m. Saturday, Oct. 30.

Prof. John Felstiner of the Stanford English Department is host for the meeting. Other sponsors and organizers are Prof. Gabriel Berns of UC-Santa Cruz and Joanna Bankier of UC-Berkeley.

For further information call Joanna Bankier, Department of Comparative Literature, UC-Berkeley, 526-8662.

Frankel to speak on world crises

Glenn Frankel, assistant foreign news editor for the *Washington Post* and a professional journalism fellow at Stanford, will speak on "How the Media Treat World Crises" during the Oct. 26 Tuesday luncheon-lecture at the International Center.

Frankel joined the *Washington Post* in 1979 after working on the staffs of various newspapers on the East Coast. .Until recently Frankel has been the *Post's* correspondent in Richmond, Virginia.

Frankel moved to the assistant editorship during a period of intense media scrutiny of major world events, such as the war in Lebanon and the Falkland Islands crisis. He will discuss the role of media in world events by examining press treatment of those two recent events.

The Tuesday luncheon-lecture series is a weekly program designed to bring speakers from various backgrounds and of wide expertise into contact with interested listeners. Tickets for the luncheon, limited to 40, are $2.50 each. Admission to the talk is free, and brown baggers are more than welcome.

For more information, call the I-Center, 497-1831.

HIP aims to help with stress and other problems

The Health Improvement Program (HIP) is offering four health improvement courses this fall for Stanford faculty/staff and their families.

The courses, listed as Classes for Healthy Living, focus on increased awareness of individual health habits and methods of changing those habits to maximize personal health and well-being.

Funded by the Office of Benefits and Records and administered by the Stanford Heart Disease Prevention Program, HIP offers a unique opportunity for SU faculty and staff to participate in activities on campus which allow and encourage individuals to take control of their health. Learning the kinds of changes we can make in lifestyle can help us look and feel healthier.

In addition to the classes listed below, HIP offers an extensive exercise program suitable for the nonexerciser and experienced exerciser alike. For more information, call 497-7940.

Stress management: A variety of methods for eliminating or coping with stress; Mondays at 5:15-7:15 p.m., starting Nov. 8, at the Stanford Heart Disease Prevention Program, 730 Welch Rd., Suite B. Fee, $25.

Hypertension self-management: Skills for self-management of high blood pressure; 5:15-7:15 p.m. Thursdays, beginning Nov. 4, at Medical Center Room A-126. Fee, $25.

Weight management: Individualized strategies modifying eating habits; 5:15-7:15 p.m. Thursdays, beginning Nov. 4, in Roble Gym, Room 33. Fee, $25.

Q.U.I.T. smoking: Strategies for resisting the urge to smoke; 5:15-6:45 p.m. Tuesdays and Thursdays, beginning Nov. 9 at 730 Welch Rd., Suite B. Fee $30.

To register send the following information along with a check payable to Stanford University through interdepartmental mail to HIP, 730 Welch Road, Suite B: your name, department, campus mailing address, campus extension, and the name of the class in which you wish to be enrolled.

Bronzes, pastels by Harris on view

An exhibition of small bronze sculptures and pastel drawings of still-lifes by Bay Area artist Paul Harris may be seen at the Stanford Museum through Jan. 2, 1983.

Harris's work has been included in many group exhibitions, among them exhibitions at the Museum of Modern Art, New York, and the Kunsthalle, Dusseldorf.

In 1967 his cloth sculptures were a feature of the exhibition Sculpture of the Sixties, held at the Los Angeles County Museum of Art, and in 1977 he was a contributor to the exhibition The Object as Poet in the Renwich Gallery of the National Collection of Fine Arts, Washington, D.C. A one-man show of his work was presented at the San Francisco Museum of Art in 1972. Harris was awarded a Guggenheim Fellowship in 1979.

Boaz Sharon

Koechlin subject of talk, recital

Boaz Sharon will be the guest of Stanford's Music Department in a free lecture-recital at 8 p.m. Tuesday, Oct. 26, in the Large Lounge of Tresidder Union.

Sharon, an associate professor and chairman of the Piano Department at the University of Tulsa, will speak on rediscovering a unique, forgotton French composer—Charles Koechlin. The lecture will be illustrated at the piano with selections from Koechlin's works.

Charles Koechlin was a French composer whose life span of eighty-three years began in the age of Impressionism and ended in the dawn of the electronic era in 1950.

A pupil of Faure and teacher of Poulenc, Koechlin produced on opus of over 220 works, largely unpublished and unperformed today. In addition to composing music in every genre he was also a distinguished music critic, aesthetic journalist, theorist, and teacher.

Koechlin was a close friend and biographer for Satie and Debussy and taught such other composers as Milhaud and Cole Porter.

Sharon, a native of Israel, was educated at Boston University, the University of Texas, and the Royal Conservatory of Mons, Belgium. He also taught at Duke. He has concertized and lectured widely throughout the United States, Britain, and Belgium.

World cities on film

"Cities of the World" will be the featured program at tomorrow night's (Thursday, Oct. 21) showing of the International Center's Other Cultures film series, beginning at 7:30 p.m. at the I-Center.

Greek actress Melina Mercouri narrates "Melina Mercouri's Athens." The film is a moving picture-post card of the beauty and chaos of the city of Athens, spiced with Mercouri's comments about modern social problems in the ancient city.

"Peter Ustinov's Leningrad" features the British actor and author narrating the story of the city of Peter, the city of Lenin and the birthplace of the Russian revolution.

The Other Cultures film series is an ongoing program which shows informative and entertaining films about all parts of the globe. Admission to the films is free, however a 75 cent donation is requested at the door.

William Eddelman to speak on scene design for Brecht

The first lecture in the Drama Department's drama forum series will be "Contemporary Brechtian Design: Productions in East and West Germany," by William S. Eddelman at 4:30 p.m. Thursday, Oct. 28 in the Forum Room of Meyer Library.

Eddelman is a scenic designer and theater historian. Admission is free.

The lecture is given in connection with the Drama Department's upcoming production of Bertolt Brecht's *The Good Soul of Setzuan*; performing Nov. 9-13 in Little Theater.

Eddelman, a member of the Drama Department faculty at Stanford, is a scenic designer and theater historian. He has been a participant in the Warsaw International Scenographic Congress, and a recipient of a Fulbright Award for a study on 17th and 18th century Italian scenography.

He has travelled extensively in Europe investigating aspects of theater design and experiments in theatrical spatial arrangements. His lecture will include a slide presentation featuring outstanding examples of experimental and innovative scenic design collected during his 1978-79 stay in East and West Germany, and will compare the contemporary trends in Brechtian productions with the earlier classic work of the Berliner Ensemble in the 1950s and 1960s.

Eddelman is a prolific and prizewinning designer for theaters throughout the Bay Area. He received the Bay Area Critics Award in 1981 for his set for *Three Acts of Recognition* at the Julian Theatre in San Francisco. Other local credits include designs for the Berkeley Stage Company, the Magic Theatre in San Francisco, West Bay Opera and Scholar Opera on the Peninsula.

Eddelman has designed the setting for *The Good Soul of Setzuan* using a textured fabric collage of bamboo, burlap, erosion netting and other natural materials to create a drab, colorless environment of a Chinese industrial city. His study of German productions has been an influence on his designs.

Free bubbly at Tresidder Monday

Tresidder Union Catering wants the faculty and staff to come over for champagne and canapes (on the house) from 4-6:30 p.m. Monday, Oct. 25, in Room 281.

The open house will help celebrate the new academic year, and at the same time give faculty and staff an opportunity to sample the kinds of goodies that are available all year long for department functions.

So, Catering suggests, forego the rush hour traffic and come to Tresidder for good food and drink *and* good company.

Do your laps at SCRA

Stanford Campus Recreation Association, 875 Bowdoin, plans to offer a five-month winter lap swim from Nov. 1 to the end of March 1983.

Daily swim hours are anytime between 7 a.m. and dusk. There is a fee.

Members of the Stanford community may call 857-0414 for more information.

Beverly Hoch

Daniel Phillips

Varied program of voice, violin by three young artists this Sunday

Soprano Beverly Hoch and violinist Daniel Phillips will be presented by the Lively Arts at Stanford at 2:30 p.m., Sunday, Oct. 24, in Dinkelspiel Auditorium. They will be accompanied by pianist Margo Garrett.

The program will include: Handel's "Meine Seele hoert," "Venere Bella" from "Guillio Cesare"; Bach's "Sonata in C minor, S. 1001 for the unaccompanied violin"; Biggs' "Soliloqui" from "Planet Earth"; and Bellini's "Come per me sereno" from "La Sonnambula."

Also Ravel's "Tzigane"; Alabiev's "The Russian Nightingale"; Rachmaninoff-Kreisler's "O Cease Thy Singing" and two pieces by Kreisler, "Caprice Viennois" and "Tambourin Chinois."

In addition, the following pieces, by Brahms will be sung: "Geheimnis," "Standchen," "Es traumte mir," "Das Madchen Spricht," and "Meine Liebe ist grun."

Hoch made her Carnegie Hall debut with Pinchas Zukerman and the Saint Paul Chamber Orchestra in three appearances at the Bartok/Schubert Festival in June 1981. She has also appeared with Zukerman and the Saint Paul Orchestra at the Kennedy Center.

In September, 1982, Hoch was a featured guest artist at the Chamber Music Society of Lincoln Center's Haydn/Stravinsky Festival.

Daniel Phillips, violin, was the winner of the prestigious Michaels Award of Young Concert Artists in 1978. He is recognized as one of the extraordinary violinists of his generation.

Phillips has appeared with many orchestras throughout the United States, including Pittsburgh, Hartford, St. Louis, the Florida West Coast and the Yakima Symphonies, and the Boston Philharmonic.

For more information about the Hoch/Phillips recital, call Tresidder Ticket Office, 497-4317.

Latest Miller film benefits ski team

While much of the Stanford campus reluctantly approaches winter, the Stanford Ski Team is eagerly fundraising for the upcoming racing session with the Warren Miller ski film, "Snowonder."

The 90-minute film, to be shown at 8 p.m. Saturday, Oct. 23 in Memorial Auditorium, is Miller's newest, and reputedly his "greatest." Ski bums will recognize his name, synonymous in the ski world with daredevil stunts, flashy freestyle footage, and generous coverage of remote, yet glamorous ski resorts.

"Snowonder" features fresh photos from the Squaw Valley 1982 speed trials, cross-country skiing in Yosemite, and Portillo, Chile—the course where Jean-Claude Killy won the 1966 World Alpine Championships with an average speed of 74 miles per hour.

The film recaptures the familiar gaiety of the annual Steamboat Springs, Colorado, Carnival and the luster of Sun Valley, Idaho.

For pros and novices alike, the movie is an enjoyable way to support a Stanford club sport. The 50-member, non-profit team competes winter quarter against teams from Northern California and Nevada in the National Collegiate Ski Association.

Tickets are $5 in advance and $6 at the door. General admission tickets for Stanford students are $4 in advance and $6 at the door. They are available at Oshman's Sporting Goods store on University Avenue in Palo Alto, and in White Plaza from 10 a.m. to 3 p.m. Mon.-Fri.

Help Center offers aid for disabled

"Being Disabled—Learning to Cope," a one-and-a-half-hour seminar presented by Help Center counselor John Preston, Jr., will be given from 12 noon to 1:30 p.m. Thursday, Nov. 11, at the Help Center in Galvez House (use the rear entrance).

Calls to 497-4577 should be made to reserve a place in the workshop before Thursday, Nov. 4.

Preston will speak candidly on what it is like to become disabled at the age of 16 and the strategies he uses to cope.

His discussion will focus on initial reaction, impact on family and friends, sexuality and self-image, and attitudinal and architectural barriers.

Parking is available near Angell Field.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Oct. 20 to cover the events of Mon., Nov. 1 through Sun., Nov. 7.

LATE ANNOUNCEMENTS

Wed., Oct. 20. Latin American Studies Bag Lunch: "The Mexican Economic Crisis of 1982" with Jaime Serra-Puche, vis. prof., Dept. of Economics, and recent adviser to the Secretary of the Treasury, Mexico. Noon. Bolivar House, 582 Alvarado Row.

Thurs., Oct. 21. AIESEC Seminar: "U.S. Business in an International Environment." Exploring questions on the survival and profitability of the country's business in today's integrated economies. Informed speakers from SRI, Stanford GSB, and Bank of America. 1-5 p.m. Rickey's Hyatt House, P.A. Open to all.

Condensed Matter Physics Seminar: "Chaos in Nonlinear Circuits" with Carsen Jeffries, UC-Berkely. Applied Physics 200.

Sun., Oct. 24. The Lively Arts at Stanford: Music by Three. Beverly Hoch, soprano; Daniel Phillips, violin; with Margo Garrett, piano. Works by Mozart, Brahms, Biggs, Bach, Bellini, Kreisler, Rimsky-Korsakov, Alabiev, and Ravel. 2:30 p.m. Dinkelspiel Aud. $7.50, $6.50; students $3 off these prices.

MONDAY, OCTOBER 25

Tresidder Union Catering Service Open House: Featuring free champagne and canapes. 4-6:30 p.m. Tresidder, Room 281. All faculty and staff welcome.

Biological Sciences Dept. Seminar: "Darwin's Botany" with Dr. Robert Ornduff, UC-Berkeley. 4 p.m. Herrin Lab, T-175. Open to the public.

Radioscience Seminars: "Observations of Electron Beams in Space" with Peter Banks, S.U. 4:15 p.m. McCullough Bldg., Room 127.

Numerical Analysis Seminars: "Numerical Methods for Singular Perturbation Problems" with David Brown, Caltech. 4:15 p.m. Math 380C.

English/History Depts. Lecture: "Oscar Wilde and Lord Alfred Douglas" by H. Montgomery Hyde, legal historian and former member of Parliament. 4:15 p.m. Room 51A, Bldg. 50.

Roble Political Action Committee Talk: By Dan Dougherty, Libertarian candidate for governor. 6:30 p.m. Roble Lounge. Open to all.

Stanford Film Society: "Duck Soup" with the Marx Brothers. 7 p.m. Kresge Aud. $1.50.

The Jean and Bill Lane Lecture Series: Grace Paley will read from her work. 8 p.m. Annenberg Aud. Public cordially invited. Further information at the Stanford Writing Program, 497-2637.

TUESDAY, OCTOBER 26

I-Center Tuesday Lecture/Lunch Series: "How the Media Treats World Crises, e.g., the Middle East and the Falklands" by Glenn Frankel, asst. foreign news editor, *Washington Post*. Noon. I-Center. Lunch tickets for $2.50 available the week before. Brown baggers also welcome.

Stanford Museum Art Tours: "The Artist Chooses Paper." A lunch hour tour beginning at 12:15 p.m. Stanford Museum. Open to all. (Tour repeated tomorrow, same details.)

Professional Opportunity Program for Ph.D.'s: "The Curriculum Vitae and Cover Letter." 3:15-5 p.m. CERAS, Room 204. For further information or to arrange an advising session, phone 497-2009.

Fluid Mechanics Seminar: "Numerical Simulation of Two-Dimensional Separated Flow" with Phillippe Spalart, NASA-Ames and S.U. 4:15 p.m. Skilling Aud.

Communications Design Seminar: "An International Data Network" with Enrique Melrose of Intergov. Bureau of Informatics. 4:15 p.m. McCullough Bldg., Room 128.

Roble Political Action Committee Talk: On election and post election problems, by Tom Lantos, Congressional representative from District 11. 4:30 p.m. Roble Lounge. Open to all.

Music Dept. Lecture/Recital: By Boaz Sharon, pianist, visiting from the Univ. of Tulsa. "Rediscovering a unique, forgotten French composer, Charles Koechlin." 8 p.m. Tresidder Lounge. Free.

WEDNESDAY, OCTOBER 27

Ecumenical Ministries Wednesday Lunch Discussion: "Workers' Rights for Men and Women and Corporate Responsibility" by Sydney Brown. Noon. Casa Zapata (Stern Hall) dining room. Bring bag lunch or arrange to eat at Zapata.

Latin American Studies Bag Lunch Series: "Chile from Democracy to Dictatorship: A Writer's Perspective" with Poli Delano, Chilean novelist and regent's lecturer, UC-Irvine. Noon. Bolivar House, 582 Alvarado Row.

Physics Dept. Colloquium: "Laser Spectroscopy in Helium Rydberg States" with Dr. Harald Gerhardt, Free Univ. of Berlin and S.U. 4:15 p.m. Physics Lecture Hall, Room 101.

Electronics in Medicine Seminar: "Spectral Analysis of Doppler Ultrasound" with Dr. Frank Ingle, Medasonics, Inc. 4:15 p.m. McCullough 134.

EE380 Computer Systems Laboratory Seminar: Topic TBA. Tom Rolander, Digital Research, Inc., Pacific Grove, is the speaker. 4:15 p.m. Terman Aud.

THURSDAY, OCTOBER 28

Solid Mechanics Seminar: "Optimum Structural Design in Dynamics Systems" with Prof. Hiroshi Yamakawa, Waseda Univ., Japan. 4:15 p.m. Skilling Aud.

Condensed Matter Physics Seminar: "Deep Level Transient Spectroscopy" with Prof. Max Schulz, Univ. of Erlangen. 4:15 p.m. Applied Physics 200.

Drama Dept. Forum Lecture Series: "Contemporary Brechtian Design: Productions in East and West Germany" by Prof. William S. Eddelman, scenic designer and theater historian. 4:30 p.m. Meyer Library Forum Room. Free. (Given in connection with the upcoming production of Brecht's *The Good Soul of Setzuan*, Nov. 9-13.)

I-Center Other Cultures Film Series: "Amish: A People of Preservation" examines their religious beliefs, sense of community and closeness to nature; and "Spend it All"—the colorful lives, romantic spirit and boistrous folk music of the Cajun people of southwest Louisiana. 7:30 p.m. I-Center. 75 cent donation at the door.

The Friends of Psychiatry & Behavioral Sciences Special Program: "Psychobiology—New Approaches to Mental Illness" by Jack D. Barchas, M.D., Nancy Friend Pritzker professor of psychiatry. Moderator, Thomas A. Gonda, M.D. 8 p.m. Fairchild Aud. Public cordially invited.

FRIDAY, OCTOBER 29

Latin American Studies Bag Lunch Series: "On Translating Infante's *Inferno*" with Asst. Prof. Jill Levine, Dept. of Romance Languages, Tufts Univ. Noon. Bolivar House, 582 Alvarado Row.

Applied Mathematics Lectures: "A stochastic upper bound for the Jackson network" by Dr. William A. Massey, Bell Laboratories, NJ. 3:15 p.m. Room 380C (Math Corner Basement).

Materials Science & Engineering Dept. Colloquium: "Materials for Generator Retaining Rings" with Dr. R. Viswanathan, EPRI. 3:30 p.m. Peterson Laboratory, Room 550A.

Women's Volleyball: Vs. Fullerton. 7:30 p.m. Maples Pavilion.

Music Dept. Concert: Stanford Jazz Band. The Big Band Era. An evening of your favorite melodies from the bands of Count Basie, Duke Ellington, Woody Herman, Les Brown, and Glenn Miller. Jose Bowen, student director. 8 p.m. Dinkelspiel Aud. $4/$2.

STARTS Great Directors Film Series: "La Religieuse" (The Nun) 1965, dir. by Jacques Rivette. Rivette explores the problem of individual liberty in this adaptation of a Diderot novel about the claustrophobia imposed by religious order. 8 p.m. Geology Corner, Room 320. $3.75 general, $2.75 students.

SATURDAY, OCTOBER 30

Field Hockey: Vs. UOP. 11 a.m. Varsity; 12:30 p.m. Jr. Varsity. Roble Field.

Varsity Football: VS. Univ. of Washington. 1:30 p.m. Stanford Stadium. $12.50 reserved, $7/$5 endzone. Ticket Office, 497-1021.

Chaparral Film Series: "Alien." Space-fiction. "No One Can Hear You Scream." 7 & 9:30 p.m. Kresge Aud. $1.50.

Women's Volleyball: Vs. San Jose State. 7:30 p.m. Maples Pavilion.

The Lively Arts at Stanford: "The Golden Age of Jazz." Ellington, Goodman, and other favorites presented by The Newport Jazz Festival All-Stars. Jazz impresario/pianist with Slam Stewart, bass; Ruby Braff, cornet; Oliver Jackson, drums; Phil Bodner, saxophone; and Eddie Hubbel, trombone. 8 p.m. Memorial Aud. $10.50, $9.50, $8.50, $7.50 general; students $3 off these prices.

SUNDAY, OCTOBER 31

University Public Worship: Student Worship Service, 8:30 p.m.; Canon Bryan Green, England, 11 a.m.; Catholic Mass, 4:30 p.m.; Evening Communion in Memorial Church Round Room, 6 p.m.

Varsity Soccer: Vs. USF. 11 a.m. Maloney Field.

Committee for Art Lecture: "Animals in Ancient Art from the Leo Mildenberg Collection" by Prof. Emeritus Antony Raubitschek, Classics Dept. A slide presentation. 3 p.m. Annenberg Aud. Public cordially invited.

ASSU Sunday Flicks: "Poltergeist." It knows what scares you. 7 & 9:30 p.m. Memorial Aud. $1.50.

EXHIBITS

Paul Harris—Still Life. Stanford Museum. Through January 2.

Venice in the 18th Century. Paintings, drawings, prints and decorative arts. Stanford Art Gallery. Through December 19.

The Map as Landscape. Familiar and new aspects of Western landscapes by Donna Van Dijk. Bechtel International Center. Month of October.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through November.

Wood Construction and Process Sculpture E. David Camardo. For library environment. The Jonsson Library of Government Documents, Green Library. Through December.

Thirty Miles from Stanford. Photographs by Paul Berger. Tresidder 2nd floor gallery. Month of October.

Paintings on Canvas by David Cusic. Coffee House Gallery. Month of October.

Photographs by Marianne Skogh. Gold Lounge, both entries, and other locations. Stanford Faculty Club.

Grace Paley to open Lane lecture series

As the first of three readings in the 1981-82 Jean and Bill Lane Lecture Series, author Grace Paley will read from her work at 8 p.m., Monday, Oct. 25, in Annenberg Auditorium.

Paley has long been recognized for her sophisticated and compassionate wit. Her short stories, which first appeared in *Atlantic*, *Esquire*, *Fiction* and the *New American Review* have been collected into two volumes: *The Little Disturbances of Man* (1959), and *Enormous Changes at the Last Minute* (1975).

Her stories, set most often in New York, have been said to "capture the itch of the city, love between parents and children, the cutting edge of combat."

Paley has taught at Columbia University, Syracuse University and Sarah Lawrence College. Her awards for writing including grants from the Guggenheim Foundation (1960), the National Endowment for the Arts (1966) and the National Institute of Arts and Letters (1970).

The Lane Lecture Series, sponsored by the Creative Writing Program, will host two other lectures during the year: Wallace Stegner in February, and E. L. Doctorow in April. For further information, call the Stanford writing Program at 497-2637.

Siguan to discuss bilingual education

"Bilingualism and Bilingual Education in Spain" is the topic of a talk by Prof. Miguel Siguan at 12 noon Friday, Oct. 22, in Cubberley 334.

Siguan is associated with the Institute of Sciences of Education, University of Barcelona. The session is sponsored by the Stanford Second Language Association.

CAMPUS REPORT

Volume XV, Number 6 | A publication for Stanford University faculty & staff | October 27, 1982

Slow research growth leads to belt-tightening

Stanford faces a new four-year belt-tightening effort due mainly to slower than expected growth in research volume.

Provost Albert Hastorf says the University will have to take "extraordinary measures" to offset a projected $3 million shortfall in the current year and to restore balance to the Operating Budget by 1985.

Anticipating some of the present problems, the University last spring trimmed one percent of its budget base for the current 1982-83 fiscal year. But now the problem "clearly exceeds our ability to correct it quickly or with a small number of measures," Hastorf told a joint meeting of the Administrative Council and Dean's Council Oct. 20.

Speaking at the same meeting, Budget Director Raymond F. Bacchetti suggested the projected 1982-83 deficit would be eased somewhat through a targeted $1 million in "expenditure holdbacks," deliberate underspending by University departments this year. Decisions already made will reduce the University's facilities reserve, which helps fund renovations, remodeling, and construction of some new buildings.

Budget cuts will "likely bear the largest burden in the long-term strategy for rebalancing the operating budget," Bacchetti told the vice-presidents and deans. A one percent cutback previously targeted only for 1983-84 will need to be increased, and extended into 1984-85 and 1985-86," he added.

Stanford's operating budget currently totals $207 million.

Since the late 1960s, through the early identification of changes in its fiscal outlook and open discussion of remedial actions, Stanford has gained the time and consensus needed to make appropriate adjustments with minimum disruption of its basic academic programs. In the early 1970s, it made adjustments totaling $16 million in its operating budget, which has been in balance since 1977.

In the budget as proved in March 1982, Stanford projections assumed research volume would grow around eight percent annually. A year earlier, the growth estimate was 11 percent. Both figures

Health care cost limits hurt teaching hospitals—Kennedy

Federal attempts to limit health care cost reimbursement are having "disastrous consequences" on the nation's major teaching hospitals, Stanford University President Donald Kennedy warned Friday, Oct. 22, in Cambridge, Mass.

He spoke at ceremonies marking the 50th anniversary of the Harvard Biological Laboratories, where he studied as a student. *(See text, page 14.)*

"If government paid the full cost of care for Medicare and Medicaid patients, it would be possible to reduce overall patient charges by 14 percent tomorrow" at Stanford University Hospital, he declared.

"We are now rapidly returning to a two-tiered system, one for privately-supported and one for publicly supported patients. It will not take much of this to end the notion of health care democracy in this country. Nor will it take much of it to put the teaching hospitals out of business and to make enormously more difficult the doing of biomedical research. . . .

"The total financial threat to research activity now looks larger from this source than from all others combined."

Former commissioner of the Food and Drug Administration, Kennedy was a national leader in opposing small business "set-asides" from research funding adopted by Congress this year. He and several major university presidents have strongly opposed proposals to cut indirect cost reimbursement by the National Institutes of Health by 10 percent across-the-board.

Federal limitation on health care cost reimbursement "shifts the burden of caring for the medically indigent from society as a whole—that is, the taxpayers—to those. . .who happen to be sick and their insurers.

"It is a scheme so bizarre that it is hard to believe that it could have been invented by a civilized nation," he said.

While competitive contracting for hospital care has a "certain appealing, free-enterprise" ring to it, he added, "in any straightforward price competition, the routine—and, it turns out, profitable—business will go away from the academic health centers to county hospitals or even to proprietary institutions. . . .

"A number of recent studies—notably one at Johns Hopkins—have shown clearly that the added costs associated with health

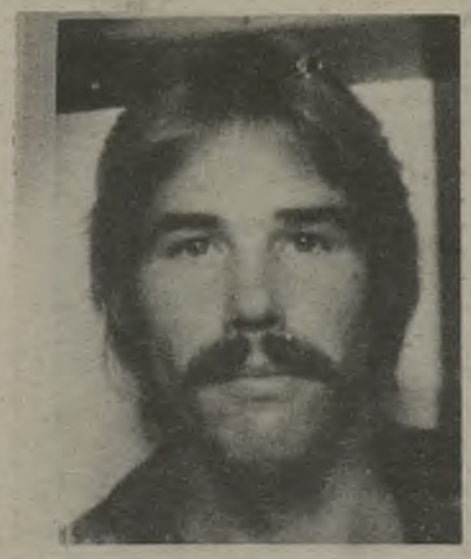
Kennedy urges self-regulation of scientists

Unless scholars become more outspoken in regulating their own activities, the public may soon view "scientific objectivity" with the same skepticism attached to such terms as "express mail" or "easy credit," Stanford University President Donald Kennedy warned Wednesday, Oct. 20, at Yale University in New Haven, Conn.

A biologist who formerly was chairman of the Food and Drug Administration, Kennedy criticized the "appalling lack of restraint" by "some biomedical scientists" in responding to commercial opportunities based on their research.

Without naming individuals or institutions, Kennedy said that the following incidents have occurred "at major universities within the past three years:"

1) University facilities have housed "the back-contracted spillover from an outside commercial venutre;"



2) A university position and laboratory "have been used to promote corporate commercial claims for a new venture;" and

3) There has been "coercive inducement of graduate students to 'join in' on an outside operation."

"Surprisingly, there has been little criticism of the researchers involved from within the scientific community," Kennedy said. "I find that shocking, given the willingness of scientists to engage in

San Jose deliveryman sought with no bail murder warrant

Donald John Amos

Santa Clara County Municipal Court Judge Miriam Wolfe Tuesday, Oct. 26, issued a no-bail murder warrant for the arrest of Donald John Amos, 29, wanted in the killing of Stanford student Angela Dee Arvidson on campus Friday, Oct. 22, Stanford University has offered a $10,000 reward for information leading to the arrest and conviction of her killer.

Santa Clara County Sheriff Robert Winter Monday described Amos as a male Caucasian, six feet three, 210 pounds, with dirty blond hair, and green eyes.

He is believed to be with his wife, Gwendolyn, and three children, ranging from infancy to age four.

Winter described Amos' car as a 1976 Mercury Monarch coupe with a dark blue top, a lighter body color, California license 304 NEO with a missing grill and missing front license plate. The left tail

Admiral and Mrs. James Stockdale with the new bust

Bronze bust of Stockdale presented

Secretary of the Navy John F. Lehman, Jr., participated in the presentation of a Felix de Weldon bronze bust of Senior Research Fellow James Bond Stockdale to the Hoover Institution, Friday, Oct. 22.

De Weldon, a prolific sculptor known particularly for his large heroic figures such as the Iwo Jima Memorial in Washington, has produced works of art for many countries throughout the world over the past 40 years.

Stockdale posed for the bust in the sculptor's Newport, Rhode Island studio in 1979.

At the Hoover Institution, Stockdale is co-authoring a book of memoirs of the 10-year Vietnam era with his wife Sybil, founder of the National League of Families of American Prisoners and Missing in Southeast Asia.

He is also writing monographs on leadership, terrorism, and modern history. He will teach Stanford undergraduate seminars in the winter and spring quarters of the 1982-83 academic year.

People

Patricia Brandt has been selected as the new director of Escondido Village and assistant dean of students and will begin her appointment on January 3, 1983.

Escondido Village consists of approximately 1,300 apartments housing more than 3,000 graduate students, spouses, and children. The community is international in character, with about 40 percent of the residents from foreign countries.

As director of the Village, Brandt will supervise residence programming and housing assignments and will act as a liaison with various other offices, including the Bechtel International Center, Counseling and Psychological Services, and Escondido Village Maintenance.

Working closely with the Office of Residential Education, she will be responsible for developing and implementing housing policies affecting the Village and for communicating these policies to residents. She will also be responsible for the development of programs which support and enhance the quality of life in the Village.

For the past four years, she has worked in the Office of Student Activities. As assistant dean of student affairs and assistant director of the Office of Student Activities, Brandt was responsible for the general health of the more than 250 registered student organizations, the hiring and supervision of staff, budgets, policy formulation, funding and space review, and the Student Directory.

Responding to the needs of students, she has also presented several panel discussions for graduate students, served as chair for the Committee on the Status of Graduate Women and for the Dean of Student Affairs Committee on Women's Affairs, and worked with the Rape Education Project, which sponsored Working Against Rape Week last fall.

The Exploratorium in San Francisco will honor **Prof. Carl Djerassi**, chemistry, at the Sixth Annual Awards Dinner, to be hosted at the museum at 7:30 p.m., Monday, November 15.

The tribute to Djerassi is in recognition of his groundbreaking scientific research in the fields of organic chemistry, pharmacology and medicine. He is best known for his contributions to the development of oral contraceptives, antibiotics, antihistamines and steroidal anti-inflammatory agents and biorational pest control.

Guest speaker at the Awards Dinner will be Dr. Lewis Thomas, chancellor of the Memorial Sloan-Kettering Cancer Center and the noted author of best sellers, *The Lives of a Cell* and *The Medusa and the Snail*. His topic will be "Medicine: the Youngest Science."

For information on attending, call 563-7337.

Sequoia Travel Center at Tresidder Union announces the appointment of **Jane D. Barrett** as director of marketing.

Barrett comes to Sequoia with 26 years experience in the travel industry. Her background includes airlines sales and ticketing, tours and group travel, in addition to management and marketing.

Stanford offers $10,000 reward in search for killer

continued from page 1

light is clear plastic, painted red.

Lt. Ron Conway of the Sheriff's Department said Tuesday, Oct. 26, "numerous phone calls" have been received since news media were informed Amos was wanted for questioning in the case. "We're fairly certain his family is with him," Conway said. "As far as we know, he acted independently."

Individuals with information should call the Sheriff's Department at (408) 299-2211 (days) or 299-2622 (nights).

Funeral services for Arvidson are planned at 1 p.m. Thursday, Oct. 28, at St. Andrews Presbyterian Church, 3228 S.W. Sunset Blvd. in Portland with Charles Brown and John Nastari officiating. Her close friend, Stanford student Danny Child, will play piano.

The killing occurred at the residence of Prof. and Mrs. Laurence Kedes at 856 Allardice Way, where Arvidson did housecleaning work.

Winter said he had no reason to think Amos knew the victim.

Winter said: "Amos had reason to be there. He is a delivery man." The sheriff did not disclose the company for which Amos works. Stanford Police Chief Marvin Herrington said that so far as Stanford police know, "he had not been there before." Winter said the killing "appears to be a crime of violence with possible sexual assault." The coroner's office reported Saturday that an autopsy showed no obvious evidence of sexual assault. "We're clearing that up," Winter said.

"The evidence includes clothing with possible blood stains. We don't have a weapon yet." Winter said he was sure Amos' wife knows her husband is wanted, but may not be aware of the magnitude of the case.

Arvidson, a junior in humanities special programs, was last seen alive when Mrs. Kedes went shopping at 2:15 p.m. Her son, Todd, 16, discovered the body an hour later when he returned home from school.

Stanford Chief Herrington said there was no evidence of forced entry and nothing appeared to have been taken from the home. Police immediately cordoned off the area and searched for the weapon, but found none.

The Santa Clara County Coroner's Office said an autopsy Saturday showed Arvidson had cut wounds of the neck and stab wounds in her chest and abdomen.

Herrington said Saturday police were conducting an extensive check of service workers—telephone installers, gardeners, roofers, and others who might have been in the area.

Police also checked license plate information on 50 to 75 cars parked in surrounding streets when the homicide was reported. They also interviewed Arvidson's wide range of acquaintances, he said.

Angela Arvidson

Saturday afternoon, Herrington gave a detailed, private review of the case to the victim's parents at their request. The group included her father, Donald Arvidson, her mother, Mrs. Marlene Torrey, and her step-father, Michael Torrey, all of Portland, Oregon. Her brother, Randall, a Stanford senior in economics and varsity golfer, joined several close friends, University officials, and faculty at the campus home of Student Affairs Dean James Lyons late Saturday afternoon.

Lyons said "students were shocked when they heard about the killing" late Friday. "She had a lot of close friends."

Carol Burmaster, who had shared a College Terrace house with Arvidson since September, described her as "sweet, intelligent, and hardworking." Besides housecleaning, she worked at the Tresidder coffee house to help pay her way through college. She wanted to become a speech therapist.

A 1980 graduate of Woodrow Wilson High School in Portland, she played piano, violin, and viola and compiled "an absolutely . outstanding record of achievement" there, Lyons said.

Other survivors, all from Portland, include two grandmothers, Mrs. Mildred Arvidson and Mrs. Audrey Perkins; a half-brother, Anthony Arvidson; a step-sister, Monica Torrey; and a step-brother, Scott Torrey.

No memorial service is planned at Stanford, but a fund has been established in her name. Contributions may be sent to Angela Dee Arvidson memorial fund, 301 Encina Hall, Stanford, Calif. 94305.

CAMPUS REPORT
(ISSN:0049-2108)

Published by the Stanford University News Service, Patricia J. Black, editor; Karen Marman, design assistant; Charles Painter and Ed Souza, photographers; Medicals news editor, Lisa Ames, ext. 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

How to train your intuition so as to make your decisions much sounder

BY DONALD STOKES

The best way to make major decisions is to train your intuition.

So says David M. Kreps, professor of decision sciences at Stanford's Graduate School of Business.

Actually, Kreps would prefer to be known—only half jokingly—as professor of decision arts and crafts. "There is no discipline of decision sciences," he says. "No science is involved in what I teach.

"What I think decision sciences is good for, what modeling in general is good for, is trying to understand little bits and pieces of a very complex situation, actually a complex mosaic.

"You use a model to study a little bit here, another model to study a little bit there, and it's like mental gymnastics. You figure out how this piece works, and where that piece fits in, but then you have to put all the pieces together, and you do that intuitively.

"It is both an art and a craft to know which pieces you should isolate and think about, and then how to put the pieces back together."

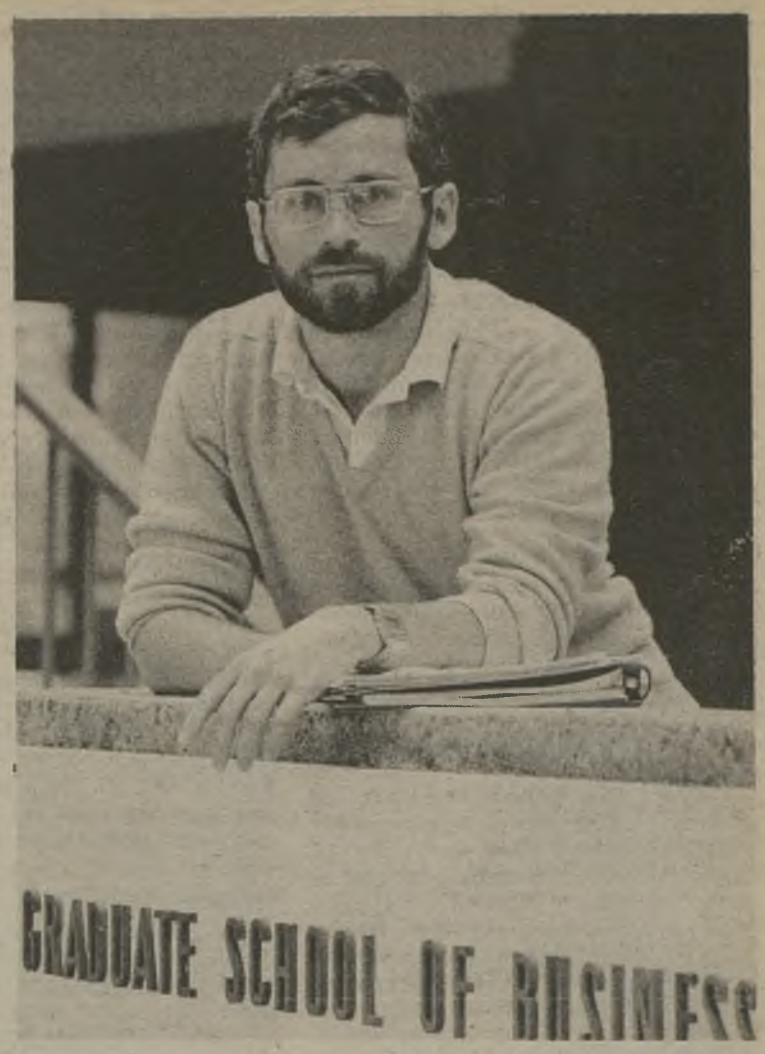
Kreps shows his students how this can be done.

Although he is only 32, Kreps is an outstanding scholar in the area of individual choice behavior. He has written works that establish him as an eminent mathematical economist. His path-breaking research probes the foundations of dynamic optimization theory, axiomatic dynamic choice theory, and choice theory in the context of sequential markets.

These sound formidable, but Kreps breaks the art (or craft) of decision-making into four steps.

"The first thing to do when you have a decision to make," says Kreps, "is to try to get a picture of what strategic options you have, and what are each of their possible consequences. Often the act of simply enumerating your options will allow you to discover very attractive options that you hadn't originally thought of.

"The next step is to look at the sources of uncertainty, the things you don't know about, and try to qu ntify how likely the various eventualities are. The.e is a lot of technique involved in trying to get probabilistic, quantitative statements about respective likelihoods.



"The third step is to try to get some feel for how you view the various consequences. It is not enough to judge them separately—you should rate them roughly in the relative ways you feel about each consequence and its relation to the others. In other words 'A would be preferable to B because. . . .' This step includes the quantification of how you feel about the risks involved.

"The fourth step is a mechanical procedure—take the judgments you made in the first three steps and put them together to get the 'answer.' And then comes the fifth and hardest step—reexamine all the judgments that you made, to see why you got the 'answer' that you did. Ask yourself what important factors have you omitted or glossed over. In other words, try to reconcile what you have put down on paper with reality."

Research in this area is roughly of two types—research into the way that people should act (the normative), and research into the way that they do act and interact (the descriptive).

"Both normative and descriptive research is used as part of the decision-making process. How you carry out the first four steps—the procedures you employ, and the framework that you use—is guided by normative theory. What judgments you make, especially in the second and third steps, is influenced by descriptive theory.

For example, if you are trying to decide how likely it is that another individual will do A or B, theory that tells you how people act and interact will give you some guidance.

Although there are certain types of mistakes that tend to be made, the main function of a model is to try to engage your intuition, so that you can make better intuitive judgments.

—David M. Kreps

What sort of mistakes are typically made by presidents or managers, in the absence of using decision science?

"Often it is easy to build a model of a particular decision, to analyze it and come up with a different answer to that which had been reached by a political or managerial process. That doesn't necessarily mean that a wrong decision was made.

"The models we are capable of building for decision-making never do justice to reality, which is always much more complex, involving so many factors it had not been possible to build into the model.

"Therefore, although there are certain types of mistakes that tend to be made, the main function of a model is to try to engage your intuition, so that you can make better intuitive judgments."

Kreps finds that first-year MBAs, when confronted with these ideas, tend to fall into three camps. "For one group, analytic techniques never become quite clear. Students will learn the rudimentary mechanics, but the idea behind their application never makes sense. These students will depart the course more or less unaffected."

This is not necessarily a bad thing, Kreps believes, as some people are naturally intuitive and using analysis to sharpen their intuition dulls it instead.

"The second group consists of those who become enraptured by the techniques," says Kreps. "They leave the course as zealots; when they have to make a decision, they follow the procedure through the fourth step and then completely abdicate all responsibility for the decision; they simply do whatever the model tells them to. Happily, we don't get too many of those.

"The third group consists of those who construct the model, observe what it says, and consider how it varies from their own gut feeling. They try to figure out why the model comes up with its own particular decision.

"These sort of people—Lord love 'em!—realize that if model and intuition vary, then intuition is more likely to be right. They take a sharper look at the model and see if the results can be sharpened so that the model becomes more intuitive.

"Once you get a good feel for what you can model and what you can't, you don't trust models very far. Instead, you use them to help build and sharpen your intuition."

As an example, Kreps told of a study which had been made into the possibility of a major disaster in nuclear power plants.

"The chances of being able to predict the possibility of such a disaster hinge on whether you can specify all of the various ways in which such a disaster might occur. Clearly this is not practical. Who could have factored in, beforehand, the sequence of events that triggered Three Mile Island?

"So what do you do? You learn from the analysis. The model will tell you much about the various types of accidents, how to build in more safety and reliability. But it cannot put in everything, so that in the end you will have to rely to some extent on your intuition."

Was the result of Kreps' methods a strengthening of a student's intuition?

"That is the whole point of what we are trying to do. You cannot build a model that gives all the necessary information. What you can do is to put in all the information that you do have, and then hone your intuition on that, without losing track of the things you can't quantify."

Kreps said that the worst applications of analysis were those when a person put in all the available information, and understood each little piece, but had no feel about how they fitted together nor why the model produced the answer it did; nevertheless the person would go along with the conclusion of the model.

"The model might be terribly flawed," Kreps pointed out. "Unless you can understand why the model says what it does, and how it relates to the larger picture, you should not pay any attention to it."

Intuition is often thought of as a capability found usually in women. Does this mean that women are able to make better judgments than men?

"That's easy to duck. If it were true, it would still be hard to verify, and it wouldn't matter," Kreps said. "The variation in intuitive and judgmental skills within a gender would completely overwhelm any average differences between genders.

Four-year belt-tightening effort follows slower growth of research volume

continued from page 1

were tied to expected inflation rates.

Reflecting changes in Washington, actual research volume has turned flat, especially in nonmedical areas. "We're not talking about drastic research cuts. The problem is that we're not keeping up with inflation," Vice-Provost Gerald Lieberman, dean of graduate studies and research, said in an interview.

While medical and defense-related research funding has been fairly strong, such agencies as the Department of Energy and the Environmental Protection Agency have not fared as well. Stanford has been particularly hard hit in psychology, economics, and other social sciences, Lieberman says.

Lower research volume

Lower than projected research volume left Stanford $3.75 million short of expected income from indirect cost reimbursements during 1981-82. These indirect costs, such as administering research, and sharing in fixed costs are reimbursed as part of the total cost of performing research.

Lower than expected growth in research volume does not immediately become apparent in these overhead costs, Lieberman noted. "Certain costs, such as energy, have risen faster than inflation. Small reductions in research do not free up lots of building space, and space needs are a very large component" of indirect costs.

"Some costs may be declining, but overall our costs are still up," he added. This phenomenon needs further study to be better understood.

Recently revised projections of research volume show $6 million less will be recovered in indirect costs than was previously expected in the current year 1982-83. The "outlook for 1983-84 is even grimmer," Hastorf said. About half the shortfall, or $3 million, affects the operating budget.

Although smaller-than-expected research volume is the major cause of Stanford's financial problems, the University also is affected by the high cost of living in the San Francisco Bay Area and "relentless" utility rate hikes, Bacchetti said in an interview.

The increase in utilities next year will be approximately double the inflation rate. "We would have had difficulties even without the research problem, and the evidence is the previously planned one percent cut this year," he said.

Discussion at the joint meeting of the Administration and Dean's councils was the first of several meetings that will be devoted to the budget. The issue was again discussed by the Dean's Council Monday, Oct. 25. The Faculty Senate will hear a presentation by Hastorf on the long-range financial forecast Thursday, Nov. 11.

Budget adjustments

"It's clear we have to begin the examination of what we can do without," Bacchetti said. "We want people to think about Stanford's welfare and what's optimum for the institution by reviewing their own areas and looking at the services they receive from others. We don't want finger pointing, but we do want a solid, critical look at what we can eliminate or reduce. People will need to think hard about what's really most important for us all."

"Budget adjustments at Stanford run in cycles close to 10 years apart," Lieberman said. "We came out of the previous two in good shape, and there's no reason to assume it will be any different this time."

Alternatives outlined

According to Bacchetti, the Budget Adjustment and Budget Equilibrium programs of 1969-77 left the University "repositioned in ways that were financially more sound. That's probably one reason we have had six years of balanced budgets since." A key element of that repositioning was decreasing the amount of endowment being spent from more than six percent to slightly under five percent.

"That doesn't sound like much, but it compounds to a lot of money. We realized then that we were spending the endowment at a rate that favored the present at the expense of the future," Bacchetti explained.

Many factors will be considered during the next several months as strategies are developed to reduce and eliminate forecast deficits:

* Budget cuts. These will probably be the cornerstone of the budget balancing effort. Identification of alternatives for 1983-84 and 1984-85 will begin in November. Each percent of reductions produces $1.5 to $2.0 million.

* Restricted funds cost-sharing. Stanford is unusual among comparable universities in not requiring restricted gifts to bear a share of the administrative and facility costs associated with the principal objectives of gift expenditures. A change of 10 percent could produce $1.7 million toward closing the budget gap.

* Program and service growth. Stanford's financial philosophy calls for providing a fraction of each year's increment for funding new ideas and new needs. Substantial cutbacks from the 1.5 percent of the base normally provided would, many believe, impair institutional vitality. Each half percent reduction would save $800,000, and some reductions will be considered.

* Facilities. Building projects not funded through restricted gifts must be funded by the facilities reserve, which is entirely funded by money transferred from the operating budget annually and by additional funds when there is income beyond budget requirements. Current projections call for a reduction of 30 percent in the size of that reserve over the next three years. This will require substantial cutbacks in planned projects.

* Other major income and expense factors. A few major items exert the predominant influence on the operating budget. Among these are tuition income, salary expense, and indirect cost recovery. Each of these as well as other items will be carefully examined to determine and compare the consequences of changes in these factors relative to present forecasts.

David Kreps...

continued from page 3

But there is an important point to be made here—intuitive skills should not be denigrated; they are very important to good decision-making. Probably we overvalue and overemphasize the hardheaded, so-called 'masculine' model of decision-making."

When asked to say what defined decision sciences, Kreps hemmed and hawed. "I guess I don't think of decision sciences as a legitimate field," he said finally. "Fields are defined either by a particular paradigmatic approach to a set of questions, or by a set of questions that are contextually related.

"Decision sciences is instead a meeting-point for several methodologies-economics, applied mathematics, industrial engineering, and so on, and a number of application areas in management—production, strategic planning, etc.

"From economics we get some feel for how individuals interact in markets. From applied mathematics we draw means of quantifying uncertainties, using probability theory, and means for solving large but simple problems. On occasions we draw from psychology and sociology, although this doesn't happen nearly enough.

"Decision sciences takes these sciences, and tries to apply them in particular contexts. Inside the decision sciences group you find almost anarchy—people held together by the courses they teach, rather than by any single world view. It is a great place for an intellectual dilettante like myself.!"

The course Kreps teaches in the fall is called "Decision Making Under Uncertainty." In the winter he will teach "Analysis of Productive Systems," Each is a core course, which all first-year MBAs are required to take.

He will also teach an elective course called "Competitive Strategy." Kreps' dilettantish mind is shown by the notice he has fixed to his door concerning this course. One paragraph reads: "You should be forewarned that my motivation for teaching this course. . .is that I would like to learn this material better, and the most effective way for me to learn it is to teach it."

The topics that Kreps tells students he will explore in the course sound like notes for a novel on modern business. They include Implicit Collusion; Signaling and Bluffing; Biological Competition. . . .

Biological Competition? Does this mean competition between various types of people?

"In a manner of speaking. The term is supposed to connote the sort of competition you see between biological species, where one type competes until all opportunities for expansion are exhausted. This will typically be competition far more intense than competition between profit-maximizing firms."

The meaning of "collusion" as used in his list of aspects to be discussed, is implicit collusion where the firms in an industry compete in restrained fashion.

"There are many ways in which such collusion can be attained. You can have peaceful coexistence because each firm is capable of making life miserable for the others, or because the firms cede to one another fairly impregnable fiefdoms.

"Each way of maintaining the implicitly collusive scheme has its strengths and weaknesses, and we try to see what those are in the cases of particular industries."

Signalling and Bluffing? "Corporations send signals all the time about their objectives and capabilities. How do you read these signals, and how should you send them?

"For example, Pratt and Whitney recently sent a very strong signal about their technical capabilities in the form of a guarantee they offered on one of their engines.

"Was that signal 'honest,' or was it a bluff. . .an action which would only pay off if it induced a particular response from their competitor, Rolls Royce?"

Reminded of his posted notice that he was giving one course in order to learn more about the subject, Kreps was asked whether the best teachers are those who try to learn along with their students.

"In any academic discipline the teacher should be growing all the time," said Kreps. "Not only that, he or she should keep changing the field of inquiry, even if only slightly, because if ever you stop, if your mind is not learning something new, it is not working.

"One way to keep your brain engaged is to keep changing what you teach, and how you teach it."

What is his recipe for successful teaching in the MBA program?

"You have to put a great deal of work and research into a course, but at the same time try for a relaxed feeling among the class. A teacher should not make the learning process too confrontational.

"But this generalization is probably incorrect. In the Business School, effective teachers range from those who are friends of their students—and I think I come in that category—to what you might call the Prussian drill sergeants.

"We have some very good, and very effective, teachers here who are Prussian drill sergeants. They make it clear at the outset that they won't stand any nonsense, that they are in charge and things will be done their way, or else. If anybody gets out of line they will be stepped on. Very often the students accept this and enjoy it.

"The lesson is that if a particular method works for a teacher, then that is the one to use."

Kreps is the son of a professor and was reared in New Jersey. Very early on he was drawn to math, and was greatly helped from the age of 15 on by the summer camps which the National Science Foundation used to run for high school students interested in math.

"We did easy number theory, and some basic abstract algebra. The idea was to expose us to real mathematics. In high school one never really gets a feel for how math really works."

After three semesters at Wesleyan, Kreps transferred to Dartmouth, which became one of the great loves of his life ("I still love it") and from there to Stanford, where he gained his M.A. and doctorate. He did operations research at the School of Engineering Research, and in 1975 became an assistant professor of decision sciences.

He spent a year at the University of Cambridge, and managed to see much of Europe before coming back to Stanford in 1979 as associate professor. The following year he was made a full professor, with tenure.

He was still under 30.

Brody, Lipset differ sharply in their election forecasts

Two Stanford political scientists offer sharply diverging forecasts for the November Congressional elections.

Using a computer model and challenging most prognosticators, Prof. Richard Brody says the Republicans probably will lose less than 20 seats in the House of Representatives and will maintain a majority in the Senate.

His reason, in brief: public approval of President Reagan's performance dropped only five percent between November, 1981 and last March, when most candidates decided whether they would run.

It's the change in ratings, not their absolute level, that counts, Brody says. His conclusion is based on analysis of past mid-term elections since 1945.

Paradoxically, "beginning with the lowest level of approval of any president may turn out to work for the advantage of Reagan and the Republicans in Congress," he says. "The 1982 elections are not likely to be the ringing repudiation of Ronald Reagan that some observers would lead us to expect."

Prof. Seymour Martin Lipset, senior fellow at the Hoover Institution and president of the American Political Science Association, personally forecasts a Republican loss of 25 to 30 Congressional seats.

Around the world, whether left or right, ruling governments "take a shellacking" whenever the combined total of inflation and unemployment—the so-called "misery index"—tops 10 percent, he notes.

In an article which will be published in the November issue of *Public Opinion* magazine, Lipset says both the 1980 and 1982 U.S. elections fit a world-wide pattern that "economics dominates politics."

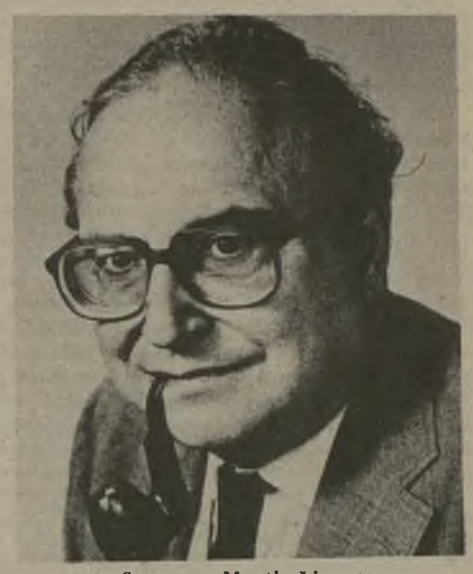
"Governing parties are punished for the performance of the economy," he declares. Among 17 democratic countries in the industrialized world where elections change ruling parties or coalitions, "since 1979 conservatives have replaced more liberal or socialist government in six countries, while left-oriented parties have upset incumbent conservative regimes in five others," he notes.

"These findings challenge the interpretation that various elections produce mandates for the victors' policies, whether conservative or socialist. . . .

"Democratic electorates seemingly expect a quick fix from governments elected during a period of economic malaise."

Paradoxically, "policy reversals which followed on shifts to the left or right. . .have contributed to economic malaise, at least in the short run. Efforts to change the economic climate and hence the expectations under which business operates are, mopre often than not, initially disruptive.

"Though the advocates of laissez-faire or the welfare state may have good reason. . .to believe their policies will have anticipated effects, such results usually only come about over the period of time that stretches beyond the next election."



Since the overriding objectives of governing parties is to be reelected, Lipset says, they may respond to continuing, world-wide economic difficulties "By falling back on a centrist position, muddling through, and hoping for the best."

Faced with a more powerful Congressional opposition, "the Reagan Administration will behave similarly," he predicts. "Even before the election, it supported increases in taxes and in the money supply.

"Ideologists will be frustrated, here as in Europe, but fortunately or unfortunately, democratic politics and efforts to implement major economic changes do not go together."

Richard Brody

Student involvement in campaign grows

If college students are supposed to be politically apathetic, apparently some students at Stanford do not know it. Several student political organizations are busy this week with activities related to the Nov. 2 state elections.

The Stanford Democrats, the Stanford Republicans, the Tom Lantos Group all will set up tables in White Plaza with information about the candidates they support.

The Lantos Group is trying to arrange for a debate on campus between Lantos and his Republican opponent, Bill Royer.

Both the Stanford Democrats and the Tom Lantos Group are also trying to encourage a large voter turnout. Junior Brian McDonald, one of the coordinators of the Stanford Democrats, said the organization, which has about 30 active members, will canvass strongly Democratic precincts in the area by phone and door-to-door this week, encouraging people to vote.

Zaroff said the 50 students active in the Tom Lantos Group will phone voters to urge them to go to the polls.

Other student organizations are trying to supply students with information about the candidates and the issues.

The Stanford Conservative Political Alliance, an organization of about 15 students, has distributed a four-page newsletter, *The Stanford Review*, that "discussed the issues, campaign trends, and the positions of some of the candidates on certain issues," according to Tim Hannigan, a member of the alliance.

Hannigan said the Alliance will not endorse any candidates. Its main purpose is to "widen the range of political discussion on campus."

"We feel the political spectrum on campus is too narrow, basically liberal, so we attempt to bring a wider variety of political viewpoints to the campus," Hannigan said.

Stanford in Government is "Now in the process of compiling information about the propositions and the candidates," according to Joel Treisman, the organization's director of new programs. Treisman said the organization will distribute information on election issues and candidates, as well as flyers urging students to vote, around the campus this week.

Apathy is not a problem in the Tom Lantos Group, Zaroff said. "The feeling is getting more and more exciting as election day approaches," she said.

"It's fast, it's intense, and it's a lot of fun. I think most of the students involved in the Lantos group feel that working on a campaign is the best thing they have ever done at Stanford."—**Phil Taylor**

All-volunteer force working extremely well, Weinberger says in Hoover book

"At the moment, the all-volunteer concept is working extraordinarily well," Defense Secretary Caspar W. Weinberger declares in the forward to *The Military Draft*, a new book published by the Hoover Institution Press at Stanford (669 pp., cloth, $19.95).

A selection of readings on conscription, the book was edited by Martin Anderson, senior fellow at the Hoover Institution and former assistant to President Reagan for policy development. Barbara Honegger served as Anderson's research assistant.

Maintaining a large peacetime standing force wholly through volunteers "may be the most critical challenge facing the Department of Defense for the next decade," Weinberger says.

The "neglect of the late 1970s" ended with Congressional approval of a 25 percent pay increase during fiscal 1981 and 1982 and President Reagan's leadership in securing increased public appreciation for those in uniform, Weinberger adds.

"All the services met their recruiting goals in fiscal 1981; test scores improved dramatically; and recruits included the highest proportion of high school graduates ever—even greater than during the draft years.

"In fact, the median test scores and high school graduate rates for enlistees were higher than those in the general youth population.

"There were also dramatic increases in the reenlistment programs of the services. The first-term reenlistment rates were among the highest ever experienced, and career reenlistment rates are on an upward trend after several years of decline.

"These excellent. . .results have continued through the first half of fiscal 1982. . . .

"Although evidence about recruits is difficult to develop, surveys show that those in the very highest and lowest economic brackets are somewhat underrepresented on a strict percentage basis. But the force is otherwise balanced.

"In addition, if we look at regional- or state-level distributions, our surveys show that we are obtaining a proportionate share of enlistees from each state."

A recent study conducted by the Departments of Labor and Defense showed that first-term enlistees were generally comparable in their backgrounds and abilities with their counterparts working full-time in the civilian sector. In fact, the IQ scores of those volunteering for the services were higher than the national average.

"The Department of Defense is optimistic about the underlying patriotism of our youth in the face of national crisis," Weinberger says. "We do not see any logic in the argument that holds that conscription or coercive national service during peacetime would encourage patriotism.

"Rather than increasing patriotism, a peacetime draft that is not perceived as necessary may result in a backlash by the youth against their government, just as happened in the late 1960s. . . .

"The all-volunteer force will continue to receive our highest priority. The real issues are whether in peacetime the nation can man its forces-with the numbers and kinds of people needed to perform their missions and whether those forces can be increased quickly enough in an emergency. We believe that the all-volunteer force is the most appropriate way during peacetime to meet military manpower requirements.

"The final and key element of success for the volunteer force is the American public's attitude toward it. Happily, the American people. . .appreciate more than ever the part they have in keeping the U.S. at peace. That continued encouragement, that respect. . .will ultimately be the strongest factor in making the all-volunteer force work."

Anderson served as a member of President Reagan's Military Manpower Task Force when it was established in 1981. While serving as a special assistant and special consultant to President Nixon, he headed the interagency task force that evaluated the report of the President's Commission on an All-Volunteer Armed Force. He also helped to develop the legislation that abolished the draft in 1971.

Letters to the editor

Many Taiwanese students here feared surveillance in 1978, Giraud says

Editor, *Campus Report*:

The letter (*Campus Report*, Oct. 13) from a Stanford faculty member who recalled a Taiwanese student's account of surveillance by other Taiwanese students and nationals has reminded me of a similar incident which also supports the findings reported by Prof. Goheen on Oct. 6 (and Carl Johnston in the *Stanford Independent* last year).

In May 1978, I was approached by several Taiwanese students who described a very disturbing situation in a student group known as the "Chinese Students Association."

It was alleged that officers of that group were not only Kuomintang supporters, but engaged in surveillance and intimidation of other students on behalf of the Taiwanese government, inviting them to report on their fellow students' political activities. The students not only resented this, but were fearful of the possible consequences of refusing to cooperate (which could include interrogation and arrest when they got back home and also reprisal taken against their families).

My calendar records a meeting at my house on May 24 of a group of Taiwanese students (my wife and I recall that there were at least eight or 10 of them), all of whom wished to be associated with a letter to the Stanford administration requesting that the University investigate their charges, refuse admission to the University of agents of foreign governments and discourage surveillance, intimidation and coercion of foreign nationals at Stanford.

Because of their reluctance to identify themselves by name in this letter, they had decided to ask a Stanford faculty member—myself—to meet with them, examine their student cards and certify that they were in fact who they claimed to be, truly registered Stanford students, in the event that the authenticity of a letter signed by "A group of Chinese students" should be questioned.

Several people in that group had also been witnesses to a physical confrontation that had taken place in San Francisco on May 20, 1978, in which unarmed demonstrators, marching in protest against the recent election of Chiang Ching-Kuo (Chiang Kai-shek's son) as Taiwan's president were attacked by a group of Kuomintang supporters who emerged from KMT headquarters and assaulted them with long wooden poles.

The incident was covered by a local newspaper, the *San Francisco Journal*, and subsequently, both an account and a photograph appeared in the *Stanford Daily* (June 6). One of the armed assailants in the picture was identified by marchers as Yeh Bing-hui, a Stanford graduate student and an officer of the Chinese Students Association here. When the *Daily* sought to interview him they found his phone had been disconnected.

It may well be that, locally at least, the situation is less fraught with physical violence than it was a few years ago, when several incidents comparable to the one mentioned above were reported. One notes that the person called "Wong" in the *Independent* story, a leader of the Chinese Cultural Association at Stanford who refused to reply to questioning about his connection with the KMT, considered himself "more liberal than our predecessors on campus," an assertion that in itself seems curiously revelatory.

There can, however, be no question that Mr. Liu Sheng-chi's characterization of the Taiwan government as "quite politically tolerant" is belied by a long history of violations of human rights, going back 35 years (the very period of Liu's residence in Taiwan) to the massacre of 1947, well documented in our own State Department's *White Paper on United States Relations with China*, published in 1949.

Those unfamiliar with the history of KMT rule on Taiwan might profitably consult Amnesty International's *Briefing Paper No. 6* of Oct. 1976, covering the arrest and detention of suspected political opponents, the abrogation of civil rights provisions of the constitution of 1946, the inadequacy of basic legal safeguards in trials by military tribunals, the use of torture in interrogation and the use of the death penalty as punishment for political offenses.

Learning what Mr. Liu calls the "ABC's" of his country includes recognizing that Taiwanese law has rested on the assumption that the country is still at war with mainland China and that a state of siege was proclaimed in 1949, putting the country under martial law. Among proscribed subversive activities are the circulation of rumors, propaganda beneficial to "rebels," the "destruction" of national policy, strikes by workers, failure to denounce persons suspected of these and many other offenses, as well as planning or preparing for any of these acts.

One might well argue that it has been the arrest, interrogation and imprisonment of hundreds of Taiwanese, legitimized by the Draconian measures adopted under martial law, that has estranged some Chinese students from their government and, in Mr. Liu's words, "tarnished the image of the Republic of China," rather than plots "engineered" by radical saboteurs.

Raymond Giraud

Cohn backs semesters for humanists

Editor, *Campus Report*:

Prof. Edward Good, speaking for the committee considering a change of the quarter system to semester (or whatever), has given a preliminary opinion that there will probably be no change, since they have examined the options and find virtues in many or most.

That is hardly surprising, but the real question should be "What is the best system for the majority of professors and students at Stanford?" Twenty years ago, when the *Faculty Forum* took a poll, semester won rather handily (as it has recently at Berkeley). But clearly some voices were "more equal," and in the end, the issue was decided by sheer administrative power: the scientists and some allies preferred the quarter and got it.

Nothing unusual in an institution which, when it considered revamping the entire educational fabric, appointed not a single humanist to the (SES) committee in charge.

Now, rhythms of work are far from being an indifferent matter. At best they come down organically from the rhythms of nature: these are "bigger than us" and part of a complex Gestalt that, like the free market, we tamper with at our peril.

The academic calendar tends to reflect old seasonal cycles, of production and harvest. Then we spiral down to our traditional week cycle, the daily schedule, and so on. In our composition (for example, of verse) the forms, it is known, reflect the patterns of biology and psychology, such as breathing attention span, and so on.

The scientists who dominate our administration—the top four administrators are scientists—would no doubt favor each sector having the rhythm it prefers. But of course, given the advantage in efficiency of a single universal calendar plus the power structure and the continuing decline of the humanities, what can one expect?

What I am suggesting, however, is that we speak of this with a maximum of lucidity and a minimum of dishonesty. The result of the committee's washing its hands will be further deterioration in the quality of work in the humanities, vis-a-vis our great sister schools such as Berkeley, Harvard, Yale, Princeton, and I see no point in hiding that.

Quarter after quarter we get these half-written and unthought-through term papers, with typing mistakes uncorrected. The students knock them off, goodness knows in the rush, and often do not bother to pick them up. The faculty who scrupulously read and grade each of these papers are getting an education, the students aren't.

Last week I had dinner with an interesting couple whose child had recently graduated from Stanford. The mother, noting that her daughter's failures were not registered, and knowing her weaknesses couldn't get over her having received honors distinction. The father said succinctly about her four years: "I feel cheated."

This may not be absolutely typical—those parents seem unusually candid—but it is worrisome, tied in with the rest of our experience. We have seen quality decline here in so many ways! Somehow it didn't help to be told by Derrida at the Ecole Normale Superieure "Our standards have dropped, too." They can afford it more. . . .

Is it folly to compare ourselves in that way and want to compete with them or Harvard, etc.? The hope that we could so compete buoyed some of us in the past. I hate to just let it go.

I think the semester would be worth fighting for, as we did in the Sterling and Lyman eras. But I sense too that the old fighting spirit has diminished along with the rest. In a sense, the humanists are asking to be dominated and to have alien rhythms imposed on them.

A kindred matter is the tendency to use computers for humanistic work. Except for routine and rather pedantic material I would strongly disadvise that. The "metonymic" and plodding machine goes on grinding out data, typically, when for a good imaginative mind two or three examples will ring a bell, tell it that it is time to go on and round out (metaphorically) one's knowledge and understanding of a complex topic. I see this distinct tendency in even my best students these days.

It is the same in the realms of music and art: one heard Arthur Rubinstein say to the beaming Rostropovich the other day on Channel 9 "There are so many today who play the notes exactly as the score tells them and so few real musicians!" I have heard our great Adolph Baller say the same thing.

Even a "word processor" (gulf) has a chilling effect on true composition. Save time? What kind of time? Does anyone seriously believe Balzac could have done *better* if he had had a word processor (or even a typewriter)? He knocked out some hundred books anyway; would more have been better?

In the realm of the liberal arts, our best thinking is done through a sort of "negative capability" (Keats) which is very different from the way business men or, I suppose, many scientists work. Speed reading is anathema to reading in depth and so is speed writing apt to be deleterious to composing in depth. It is the very resistance of the mechanism for expressing oneself that often allows the mind to wander in innovative ways. Similarly, an overly smooth organization of class time easily becomes glibness. At such a metronomic pace, there is no room for genuine insight or discovery.

But it is certain that the great teachers of the past got many of their deepest creative penetrations through instants of fiery confrontation (inward or not) with dazzingly fresh young minds, in a way that had little to do with prepared texts. And when the teaching machines take over, forget all that.

I see students of the near future numbly staggering away with the glazed look of Atari addicts. Fiery confrontations my footie: rather an electronic shortcircuiting of life. . . .

Robert Greer Cohn
Professor of French

Counseling institute seeks clients with depression, relationship woes

The Stanford Counseling Institute, which offers general counseling services to the community for a wide variety of problems, wants especially to find clients suffering from depression or relationship problems.

The counselors are all Ph.D. students in counseling psychology and are supervised by faculty members. Their services are available to the general public as well as the campus community. A sliding scale tailors fees to what the client can afford.

Depression is often experienced by the individual as sadness, dissatisfaction with present circumstances, or pessimism about the future. People who are depressed often become very critical of themselves and may feel less energetic and less interested in people and activities than they would like.

Treatment for depressed people at Stanford Counseling Institute is tailored to the individual and therefore varies from person to person. The client also learns and applies skills for changing negative situations.

Another group of counselors provides services to couples who are experiencing relationship problems. These may take the form of poor communication, excessive arguing, sexual problems, difficulties expressing affection, conflicts over child-rearing issues, or dual-career problems.

Here again, treatment is generally short-term and tailored to the individual couple. It often involves teaching couples specific skills to help them more effectively solve the problems they face.

The Stanford Counseling Institute also offers help for handling anxieties, fears and phobias, stress, social skills, communication difficulties, and family problems.

Anyone interested in obtaining counseling service through the Stanford Counseling Institute should call 497-2113.

Marchaj to talk on sailing theory, practice

C. A. Marchaj, author of *Sailing Theory and Practice* and *The Aero-Hydrodynamics of Sailing* and a visiting research fellow at the Department of Aeronautics and Astronautics at the University of Southampton (England), will speak on "The Aero-Hydrodynamics of Sailing" at 4:15 p.m., Monday, Nov. 1, in Skilling Room 191.

Marchaj is in the Bay Area to participate in The Ancient Interface, a technical symposium on sailing cosponsored by Stanford's Department of Aeronautics and Astronautics.

For more information about these events, contact Alan Adler, mechanical engineering, 493-5231.

Law Dean Ely takes cautious view of judicial activism

In a democracy, "no elite's definition of what is right and good is entitled to any special deference," according to Dean John Hart Ely of the Stanford Law School.

The author of a major book entitled *Democracy and Distrust*,he argues strongly against the judicial activism favored by many of his academic colleagues nationally:

"We are a democracy precisely because we do not as a society believe that any of us has a greater right than any other of us to dictate what is ultimately important. . . .

"Thus I say to the courts: Enforce those rights respecting which there has at some period in our constitutional history been sufficient popular consensus to secure for them a place in the document.

"Enforce those rights that are needed to let us all freely and equally register our preferences.

"Enforce for minorities those rights that the majority has seen fit to guarantee for itself.

"Enforce all those rights with all the vigor you can muster.

"But beyond that, you simply have no right in a democracy—no more than philosophers or law professors or anyone else has—to tell the rest of us that we have made a mistake and that you know better."

Courts "sit primarily to safeguard democracy, to make sure that political incumbents do not manipulate things so as to deny others an effective right to participate in either the democratic process or its outcomes."

Such rights of access and of equality "are those with whose protection we should least trust elected officials," he explains.

"Such officials have every incentive to bar the access of various insurgent and dissent groups to the process. . . . And they have similar incentive to cooperate with some dominant majority of their constituency—enough to return them to office—so as to tyrannize, or at least to discriminate against, certain minorities whose continued support they do not need.

"To be contrasted in this regard is judicial protection of 'society's fundamental values,' the favored recipe of the academic theorists. For if it is truly the 'values of the people' that the theorists want enforced, elected officials have strong incentives to define them correctly—and thereby to insure their return to office—and thus the intervention of the judiciary cannot be justified. . . .

"Democracy increases the range of significant decisions for which the citizen has responsibility and thus increases her opportunities to behave in a moral manner. To the extent this rationale is valid, it should lead to a form of judicial review that increases the opportunity of the citizenry to participate in politics and political decisions and, having done that, leaves the product of their decisions alone."

Earlier examples

Early in this century, Ely notes, "something called 'liberty of contract'—which translated into the right not to pay your employees the minimum wage or to work them more than the maximum hours—was vigorously protected by the Supreme Court, even though it is nowhere mentioned in the constitutional document.

"The Burger Court has created a modern counterpart of liberty of contract by constitutionally enshrining the right to have an abortion, although, of course, that right, too, is nowhere mentioned in the document."

Both are properly left to elected officials, Ely says. He personally agrees that women should have the right to an abortion.

Ely's views were developed in the Rocco J. Tresolini lecture in law at Lehigh University this spring and reprinted in the current issue of *The Stanford Lawyer* a publication for alumni of the School.

Lawyers settle Brody Lockard suit

Attorneys for Stanford University and Brodie Lockard, a varsity gymnast injured during practice on Dec. 6, 1979, have reached an out-of-court settlement of their legal dispute which was being heard in Santa Clara County Superior Court in San Jose. The terms were not disclosed.

In a joint statement, the attorneys said:

"The case of Brodie Lockard vs. Stanford University has been dismissed. Stanford University has agreed to provide for Mr. Lockard's basic future medical care, even though it has no legal obligation to do so. No finding or decision has been made which in any way attributes fault to Stanford University or any of its employees for the happening of Mr. Lockard's accident.

"Pursuant to the agreement between Mr. Lockard, his family and representatives and Stanford University, all court records have been ordered sealed, and there will be no statement issued other than the dismissal of the case."

Mel Toff, of Mountain View, represented the University and its insurance companies, while Mel Belli of San Francisco represented Lockard.

At the outset of the trial five weeks ago, Belli asked the jury for an $18 million verdict. The University has been aiding Lockard and his family since the accident occurred.

Federal Express explains routing

In order to clear up some confusion regarding sending packages via Federal Express, members of the Stanford community may note the following information:

- If you do not have an account number with Federal Express you can still ship your package through the traffic department at 330 Bonair Siding, if you bring along an SU-10 form.
- If you do not have an account number with Federal Express and would like one, you can be billed separately and get separate pick-ups at your own location. To open an account with Federal Express and to call for pick-ups simply call 800-238-5355. Volume discounts are applied by account number.
- Federal Express has provided a drop-off box in Tresidder Union which will accept packages of any size up to 70 pounds until 4 p.m. every business day. The validator on the machine imprints the date of your shipment on all copies of the airbill.
- Federal Express provides preprinted airbills to all account holders. If you have run out of them and would like more, or if you've never had any please call the toll free number and order some.

CONTEXT extended

Associate Provost Edward E. Shaw, director of the Center for Information Technology, has extended the date for closing down the DEC2060-based Context system to no earlier than Dec. 31, 1982.

A seminar to discuss substitutes for Context is scheduled for 4 p.m. Monday, Oct. 25, in Polya Hall, room 111.

Ultrasonic occupancy sensors help Business School trim utility costs

"Our electricity use went down so much, Utilities called to see if our meters had broken."

Speaking is Barbara Taddeo, building manager at the Stanford Graduate School of Business, where major lighting modifications have recently been completed by Stanford's Facilities and Services Office.

Similar projects have been finished since the summer of 1981 in Meyer Library, the Herrin Biology building, the Art Library, and in a group of about 80 classrooms.

Because over 30 percent of the electricity used by the University is for lighting, many opportunities for improvement remain. The task of evaluating these opportunities, and of proposing other cost-effective energy conservation projects, falls to the Energy Program Office.

Probably the most interesting form of lighting control that Stanford is experimenting with is the ultrasonic occupancy sensor for classrooms.

Surveys indicate that 50 percent of the time classroom lights are on, the rooms are vacant. An occupancy sensor emits an inaudible high-frequency tone, which is reflected back differently from an empty room than from one containing a person. A few minutes after the last person leaves, the lights go out, even if that person has carelessly left them on.

Three rooms in the GSB have been equipped with these sensors.

GSB modifications

The modifications in the GSB and the other buildings represent the $200,000 first phase of a two-part, three-year lighting program.

This phase has emphasized meticulous surveys of existing lighting conditions, and low-cost improvements such as delamping fluorescent fixtures where light levels were found to be excessive or replacing incandescent lights with more efficient fluorescents.

Yearly energy savings from work already completed are expected to total over $100,000, at a cost of $136,000. The remaining $64,000 is being used for similar measures.

In a typical delamping project, one out of every four to eight fluorescent lamps are removed. Also typically, few people in the office really notice the change.

"We go through very thoroughly and make sure the lighting level will be appropriate after the delamping," says Karl Johnson, who heads the lighting program.

Conversions from incandescent to fluorescent lighting also make good dollar sense for Stanford. A fluorescent light is three to four times more efficient than an incandescent bulb.

In addition, because PG&E is currently sponsoring a conservation incentive program encouraging changes to more efficient sources of light, the University is expecting a $14,000 refund check to help defray the costs of over 1,000 conversions made last winter.

The Energy Program Office is now entering the second phase of its lighting program, which focuses on controlling when and where illumination is actually needed. Planned projects involve various kinds of timers and switches as well as extensive additional fixture conversions.

The total costs are estimated to be $419,000, with yearly energy savings of over $100,000, and another $9,000 refund from PG&E for the fixture conversions.

Common sense works

Some approaches to controlling lighting use the kind of high-technology wizardry normally reserved for "Star Wars"—but many problems can be solved in a simple, common-sense way.

"In the Art Library basement stacks, there is a large, locked-off area which is rarely used," Johnson said. "But one light switch controlled the entire basement. The locked-off area was rarely occupied and usually lit. We simply installed another switch for the locked-off part. It will save us about $1,200 a year—with just one switch."

Other switches will be installed where better control of lighting is possible. Library stacks, where only a small portion so a lit area is actually in use at one time, are a good example.

Taking advantage of natural daylight is another excellent approach to reducing electricity consumption. Many buildings at Stanford were designed with this in mind. To compensate for natural variations, light-sensitive photoelectric cells can turn lights on and off, maintaining the correct light level the way a thermostat regulates temperature.

Despite all the fixture conversions, photoelectric controls and ultrasonic occupancy sensors, there is no substitute for one thing in energy conservation: if you're not using it, turn it off.

—**Lyle B. Zimmerman**

Congress may impose more controls if scientists don't regulate themselves

continued from page 1

frank criticism of institutional practice in the same areas.

"Unless there is firm rejection of such behavior, the public will be perfectly entitled to conclude that the scientists are more interested in profits than results."

Limits on universities

Kennedy said there are "sharp limitations" on what universities can accomplish in this field: "Standards of the profession, publication policies, criteria for the acceptance of work, and peer review are functions that the professoriate rather than the academy must regulate."

Failure to do so "may invite unwelcome attention from others," he added. "Congress is now making concerned gestures about matters ranging from the treatment of animals to scientific fraud, and one hears proposals for government auditing of research to insure proper practice."

Self-regulation should include "firm protection. . .to the open character of scientific work," Kennedy added. "Journals should not publish any articles from which proprietary information has been held back so as to make the new work more difficult to replicate, and (professional) societies should refuse to allow papers to be presented at meetings if they are subject to similar restraints."

Scientific communication should include enough information about how an experiment was done that a competent investigator in the same field can do it the same way. "This is an exacting requirement," Kennedy said. "It compels the release of all relevant information about methods and techniques.

"Secret ingredients, magic sauces, and your own special glassware are fine in cookery or in product development, but in fundamental science they are *out*."

Several forces have combined to compress the normal pattern of innovation, blurring the clear separation between fundamental research, publicly supported and characterized by open communication, and applied work, financed by private venture capital with proprietary protection of information, Kennedy said.

These include:

1) The apparent readiness of several disciplines, such as immunology and genetic engineering, for accelerated application of knowledge;

2) Growing social awareness of the importance of scientific discovery to national productivity and "a consequent impatience" with the traditional pattern of technology diffusion;

3) A reduction of federal funding of basic, non-defense research by more than one-third (in resale terms) since 1968, with the resulting search for alternative sources of support; and

4) "The style of venture capitalization, which places new premiums on the early capture of intellectual property." Because of changes in tax law, the funds available have risen from an estimated $70 million in the mid-1970s to about $1.5 billion this year, he said.

"It is easy to forget, amidst the present excitement, that the universities have sponsored many more millionaire textbook writers than millionaire computerists or cloners," Kennedy observed.

"The university does not assert copyright to books written by the faculty—scholarly, text, or trade—nor does it try to attach other creative works. Reflected glory, and that alone, is the traditional institutional reward for such faculty (works)."

Curbing outside involvement

While there is no single, highly consistent framework governing outside involvement by university faculty or the ownership of intellectual property, Kennedy said universities should continue to make its primary claim on the time and energy of faculty "but permit limited outside involvement when that clearly offers benefits both to the faculty member's professional development and to the university-based research and training programs.

"Disclosure of these relationships should, as now, be required on demand (by the university)—and, if it proves necessary, as a matter of routine.

"Management responsibilities (held by faculty members) outside the university should generally be viewed as inconsistent with the primacy of university commitment—including significant personal responsibility for any regular laboratory operation off campus.

"Such roles not only become compelling time commitments; they may lead, as we have learned, to awkward mixtures of proprietary and non-proprietary work. They also encourage the introduction of secrecy to university-based programs and impose troublesome conflicts on graduate students.

"On the other hand, I think that intellectual proprietary rights should be vested primarily in the faculty member. After all, one of the attributes of university research that distinguishes it from that done in corporate settings is its independent, individual character.

"If we are to assert primary claims to faculty time and energy, it would seem appropriate to reward that loyalty by assigning the proprietorship of intellectual accomplishment to the innovator. It is up to us to structure incentives that will encourage inventors to assign rights to the university and to share the returned value with the entire enterprise. . . .

"No valuable invention should be delayed in its progress toward human service by the institution's own need for financial return. In most cases, that principle will lead to a first preference for non-exclusive licensing (of patents) and a fee structure designed to encourage broad participation by commercial developers.

"Second, there should be care to avoid pressure on faculty and students to concentrate unduly upon 'developable' ideas, or to keep secrets in the course of developing them.

"Finally, the university as licensor must take careful note of its other roles as investor and research proprietor, and maintain a strictly neutral policy with respect to licensing ventures that may be partly owned by the university or its faculty members."

Institutional policies

Institutional policies regarding acceptance of research grants have been "heavily conditioned" by post-war federal support, he noted. "There are no restrictions on publications and the federal patrons of research have not usually claimed patent rights.

"By contrast, a number of private research sponsors have asserted such rights in advance, through requirements that they hold exclusive licenses on any patentable discoveries made under their support.

"Where the institution claims no such rights, the acceptability of such conditions becomes a matter for the faculty member to determine. But where the institution retains rights to the intellectual property, the decision becomes more complex and difficult.

"If a faculty member were to assert that a line of important work could only be supported if a private sponsor were granted exclusivity in advance, I think the university would agree to take the project.

"What if the institution were deciding the matter on its own? I confess I would have difficulty. The situation offers too many temptations for *a priori* restraints on communication, too much emphasis on investment return, to leave me comfortable.

"I expect this to become one of the main policy issues in this area, the more so because large grants of this type have been made to several institutions."

So far as openness is concerned, "most universities refuse any but the briefest delays in publications time and reject restrictions upon access to programs," he noted.

"They have also had to cope with the increasing threats to informal communications posed by the actions of commercial firms, especially in biotechnology. Several active or prospective litigations concern the patenting of DNA sequences by companies who obtained required material through informal exchanges with academic scientists. And for each lawsuit, there are a dozen horror stories.

"Whatever the merits of these, the perception is that people are prepared to take advantage of naive informality on the part of academic researchers. The latter, predictably, are reacting by becoming more cautious.

"Meanwhile, the universities are trying to provide them with increasingly aggressive legal protection, and evolving policies for the distribution of research-derived materials that will prevent their commercial appropriation while encouraging academic circulation."

Peterson heads earthquake group

Associate Vice-President for Business and Finance Kent Peterson has accepted responsibility for developing and implementing a program of earthquake preparedness at Stanford University.

Assisting him in the assignment are Director of Public Safety Marvin Herrington, Director of Health and Safety Alain DeCleve, and Assistant Director of Facilities and Services Gary Cavazos.

They will work on contingency plans, earthquake preparedness for offices, laboratories, and dormitories, and earthquake-resistant building design and maintenance.

The group, which also will include representatives from the Hospital, SLAC, the student residence system, Risk Management, and the Provost's Office will meet once a month.

Questions on earthquake preparedness should be directed to the Earthquake Information Center at Police Services, ext. 7-9633, for the main campus. At the Medical Center, call Mary Catherine Krawec, 7-6871; at SLAC, Fred Peregoy, ext. 2221.

Big quality spread in medicine...

continued from page 1

care in academic centers has to do with the severity and technical complexity of the caseloads handled there.

"As smaller hospitals 'compete' successfully for routine care, there will be further concentration of the difficult cases in academic centers, followed by further increases in charges to cover the inadequacy of reimbursement. The shortfall will widen, and the teaching hospitals will be driven to further distress.

"That will, of course, be bad for research. . .(and) bad for patients."

As a teacher of medical students, chairman of a hospital board, and head of three different national committees on health policy, as well as FDA, Kennedy has been "impressed by the enormous quality spread in American medicine.

"There is a mythology to the contrary, much of it generated by then-professional organizations of medicine. They are conspicuously devoted to the proposition that there shall be no second-*class*doctors; but it does not follow that there are no second-*rate* doctors.

"The cases that wind up at Stanford or Massachusetts General Hospital or Peter Bent Brigham are in substantial part there because of quality. These institutions get the difficult cases because they are good.

"Indeed, sometimes they get them because others are not: the second hip replacement is a more complex procedure than when the first is bungled. So a particularly disastrous social consequence of inadequate reimbursement and 'competition' is that the effect falls selectively on the institutions of highest quality."

Kennedy noted that the array of scientific laboratories built on the nation's campuses in the late 1950s and 1960s now are "decaying slowly," and it's getting "harder and harder to find (private) support for bricks and mortar."

Since 1967, the federal nondefense budget for scientific research has shrunk by about 37 percent in real terms, with half of that reduction taking place in first two years of the current decade.

About two-thirds of all basic research now is done in universities. Of the total of all university research budgets, only three or four percent now comes from industry. "Thus, to make up for a one percent drop in federal support, we would have to increase industry's support by 25 percent," Kennedy said.

"It is perfectly plain that a vigorous and creative research establishment in biology and in the other basic sciences is a social obligation of the most serious kind, and that only the public sector is capable of meeting that obligation. . . .

"We need to examine the policies that govern our institutional arrangements for doing biological sciences. They have been revised in haste, even desperation, to meet current economic exigencies. As a result, their convergent effects are haphazard and often unexpectedly damaging, as in the example of academic health centers."

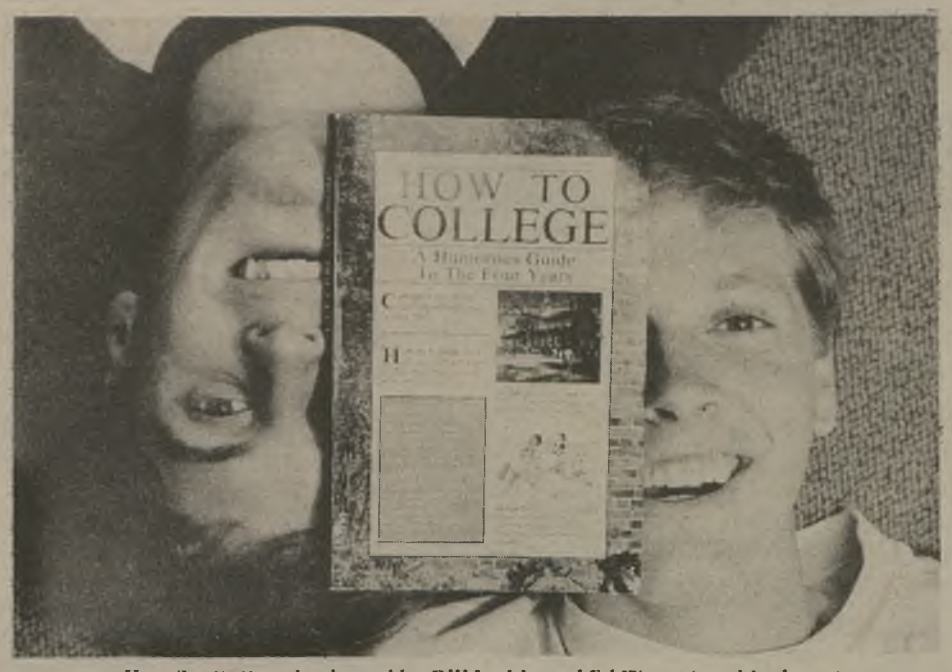
Increased funding of fundamental research and efforts to reduce the "rolling liability" for buildings and equipment should be accompanied by the complex task of "policy renovation" within Congress and the Executive Branch, he said.

Get hep, preps—read Stanford experts on *How To College*

With their tongues in their cheeks and hands on their wallets, three liberal arts students who graduated from Stanford last June have published "How to College: A Humorous Guide to the Four Years" (208 pp., paper, $4.95 from Primer Press, P.O. Box 3710, Stanford, Calif. 94305).

Making no apologies to editors of *The New York Times* and other college raters, Bill Jeakle, Eugene Reardon, and Ed Wyatt offer a quick list of "50 of the best state schools in the country," ranging from "1) University of Alabama" and "2) University of Alaska" right through "50) University of Wyoming," in alphabetical order.

"When choosing a college, you must take all the factors into account: reputation, number of the opposite sex, libraries, number of the opposite sex, post-graduate placement record, and number of the opposite sex," they suggest.



"If you picked at random, you'd probably be happy, so don't take the decision too seriously."

For those who persist, they offer these descriptions from a Southern gas station operator:

Princeton: "This place is nothing but a place where a bunch of rich snobs go to live with other rich snobs and learn how to be richer snobs."

Notre Dame: "Great school. . .but they're pretty Catholic."

Berkeley: "They'll take any low-life off the street. . .the only thing they have to pay for is drugs."

***How To College* is viewed by Bill Jeakle and Ed Wyatt (upside down).**

Arkadelphia A&M: "Cost me a couple hundred, but it was worth it. Best education money can buy."

Among the daring things a student can do before going to college, they suggest using a number three pencil on the SAT, including a nude photo on your college application, writing a bad check to cover the application fee or turning down a full tuition scholarship to an Ivy League school.

For those high school seniors now faced with the terrifying thought that one set of parties and pep rallies may be replaced by another, they counsel: "In no time at all, you will have decided what college you will attend, and that decision will affect your every resume, date, and cocktail party for the rest of your life.

"Be careful, there's nothing worse than a boring cocktail party."

"Having your parents visit you at school is a little like winning an all-expense paid trip to Akron: it probably won't be harmful, but what's the point of it?" they advise. "You'll have to miss a night or two of partying to go out to dinner with them," clean up your room, forego swearing, and go through the motions of "dating" your boyfriend or girlfriend "lest your parents think there is anything more to the relationship." The five best things about your parents visiting are that "they'll bring you money." Period.

When money and other real world needs became rather pressing in their junior year, Jeakle said, "We saw that four years of studying and a lot of tuition money had taught us one thing: how to college. So the most logical thing was to write a book about it."

"We spent four years researching," added Wyatt. "We're trying to make all of those all-nighters and frat parties pay off."

Jeakle and Wyatt both majored in English. As freshmen, they combined talent to produce a dormitory newspaper, *The Weekly Obscenity*. Reardon, an economics major, handled the business side, while Phil Chalk, a *Stanford Daily* cartoonist, provided illustrations.

After raising money from friends and family, they launched The Primer Press to produce and market their college guide.

FBI established files on Bay Area student homosexuals, GLAS discovers

The San Francisco office of the Federal Bureau of Investigation established files on homosexual student groups at Stanford, College of San Mateo, Cal State-Hayward, and UC-Berkeley in the early 1970s, according to documents obtained under the Freedom of Information Act by the Gay and Lesbian Alliance at Stanford (GLAS).

Ray Koskovich, GLAS archivist, obtained 19 pages of material from the FBI dating from 1971 to 1975 in response to his request.

These included a copy of the San Mateo Gay People's Union constitution, found in a folder atop a garbage can there, together with an internal memo recommending no investigation of the group; clippings from *The Daily Pioneer* at Hayward in 1971 and 1972; a 1971 *Stanford Daily* story headlined "Gay Students Drop Straight Roles"; and a heavily censored 1974-75 student activities directory forwarded to San Francisco by the resident agency in Berkeley.

Six additional pages of information were denied GLAS "in the interest of the national defense or foreign policy," to protect the personal privacy of others, or to protect confidential sources and internal roles and practices of the FBI.

The Gay Law Student Association at Stanford is preparing an appeal to obtain this information as well, Koskovich said.

He was "not at all surprised" that the Stanford group was of interest to the FBI, since it was organized in 1970 as one of the earliest student groups of its kind nationally. "Now the FBI couldn't possibly keep up with all of us," since so many campuses have gay groups, he added.

In replying to his request, the FBI "accidentally let us know they were gathering information about most gay student organizations in the Bay Area, not just us," Koskovich said.

"Most of the other groups were quite surprised" to learn this had been done, and now may plan FBI requests of their own, he added.

In the late 1970s, the FBI reportedly curtailed its domestic intelligence activities, compiling information on organizations only in the course of actual criminal investigations. In recent months, however, many federal officials have repeatedly expressed concern over possible loss of technological secrets from Silicon Valley to foreign countries, particularly the Soviet Union.

Koskovich became interested in possible FBI campus surveillance following an extensive story in *The Advocate*, a gay newspaper, which concluded there has been "a concerted nationwide surveillance and investigation program by the FBI into the lives of wealthy, prominent, closeted homosexual men as well as into gay civil rights groups" for nearly 30 years. But surveillance of gay groups "slowed" by the late 1960s and early 1970s, *The Advocate* added. It did not mention student surveillance.

"The FBI's national headquarters said they had nothing on us."

But there's "some reason to suspect" Stanford might still be a target for surveillance, since the FBI has acknowledged covering gay bars in Silicon Valley, he observed. While there's no evidence this actually is happening at Stanford, "we're open to the community and a fair number of our members work in Silicon Valley."

Historic Serra House faces two-mile move near Law School

Serra House, built in 1924 as Stanford President David Starr Jordan's retirement home, will be moved to a new location near the Law School this fall at a cost of about $696,000.

Now located near the intersection of Campus Drive and Jordan Way, Serra House will continue to be occupied by the Center for Research on Women (CROW), the feminist studies program, and *Signs*, a journal of women in culture and society.

Its present site will be used for a new cooling tower and for a proposed $25 to $35 million cogeneration plant, producing both electricity and steam from a single fuel. Costs of the move will be charged against these projects.

Planned for late October, the two-mile move on Campus Drive will permit occupancy at the new site by late February 1983.

The new location will be south of the Law School, adjacent to Mariposa House, near the intersection of Salvatierra St. It will require the replacement of 22 parking spaces.

Designed by Birge Clark, Serra House will be close to two other buildings of similar vintage, Rogers and Owen Houses. Previous campus plans called for this area to eventually become a parking facility.

"With space so scarce, there is little likelihood of moving the other three buildings in the foreseeable future," according to a report considered by the Board of Trustees, who approved the Serra House relocation Oct. 12.

The move is estimated to cost $96,000 more than an equivalent amount of new building space, but this would have taken 15 months to complete and resulted in the destruction of a historic building.

In the past, the University has decided to pay a comparable premium in rebuilding and renovating existing buildings on the Main Quadrangle.

Earlier this year, Ventura Hall, which adjoined Serra House, was cut in half and moved to a new location at the intersection of Campus Drive and Panama St.

CROW, feminist studies, and *Signs* will be temporarily located in the Old Chemistry Building during the transition. Phone numbers will remain unchanged.

卍卍 **Medical Center MEMO**

'Super donors': a special group of blood givers

BY DEBORAH FRANKLIN

Les Chibana arrived at work three and a half hours late one day last month so he could help keep a leukemia patient alive for a week or more.

Chibana's commute from San Mateo to Palo Alto included a stopover at the Stanford University Blood Bank where he became one of a small but special group of "super donors."

The life-supporting blood removed from his arm was less than the usual one-pint donation, but through a procedure called "platelet apheresis" he was able to give, with no danger to himself, between six and ten times the number of platelets usually found in a pint of whole blood.

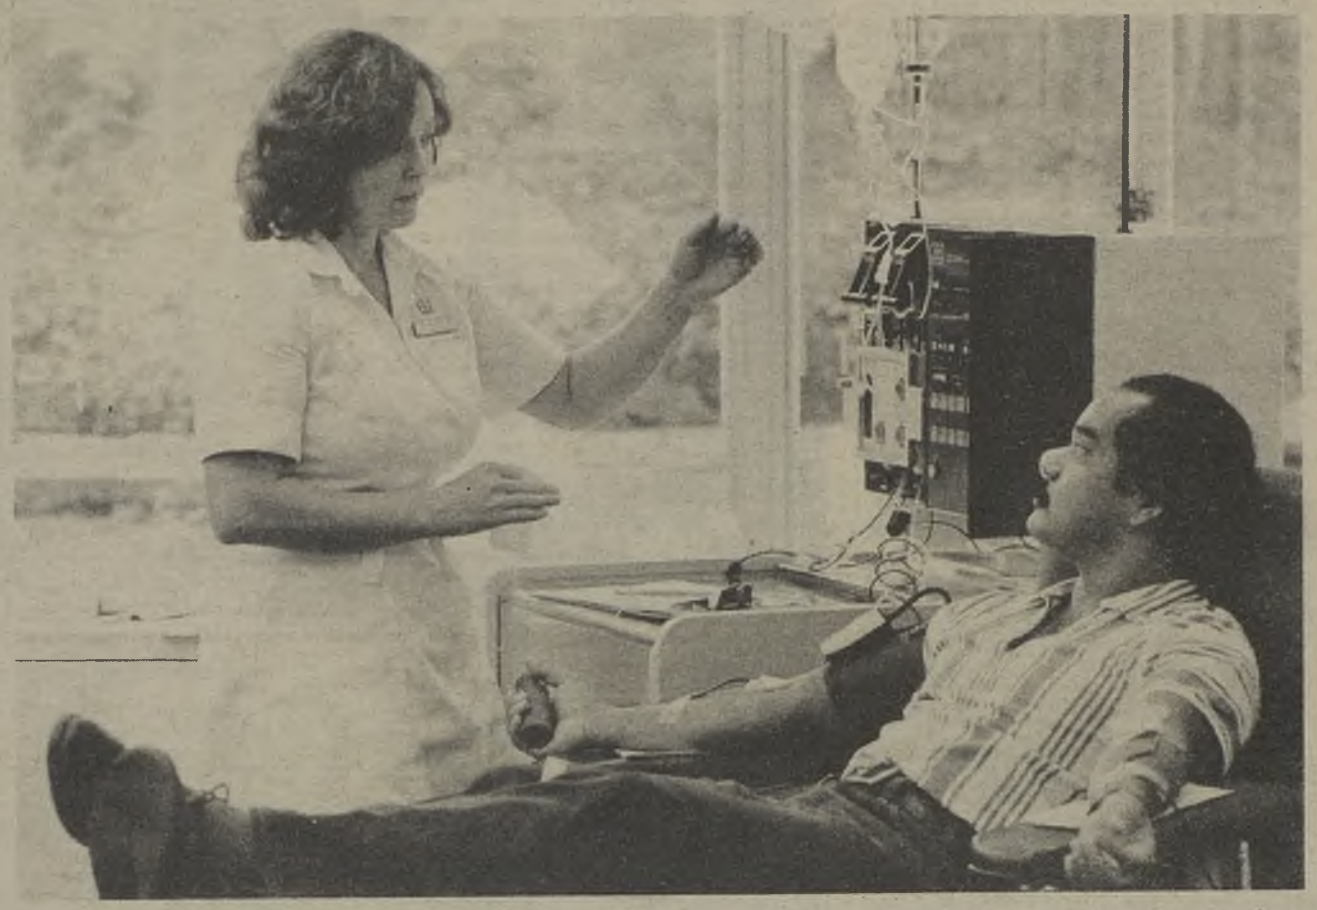
"Knowing that there's a specific patient who needs my platelets makes a big difference to me," said Chibana, a graphic designer. Even before donation, Chibana's platelets were earmarked for a specific patient whose needs were made known to him by an urgent phone call.

Through apheresis, donors can be custom-matched to recipients, reducing the risk of rejection and decreasing the adverse reactions that can occur when patients receive blood from many unmatched sources.

In the same way that a cream separator skims rich froth and leaves milk, the apheresis machine pipes blood into a centrifuge from one arm of the donor, separates the blood components by weight, and returns the majority of the blood—"rehomogenized"—to the donor. Only the component needed most—usually platelets or white cells—is removed.

Less than a pint of the volunteer's blood is out of his body at any one time, enclosed within the sterile, disposable plastic tubing of the machine. The platelets taken—about eight tablespoons—will be replaced by fresh cells from his bone marrow within 24 hours.

Because a smaller quantity of blood is drawn, a super donor can give blood components more frequently than a whole blood donor, who is advised to allow eight-week intervals to pass between donations.



Leukemia patients use most of the platelets and white cells gathered through apheresis at Stanford's blood bank, said Pauline Burn, apheresis coordinator. Last year 64 patients received components garnered through 439 apheresis procedures, she said.

Most patients who need blood only require that it be matched to their ABO and Rh type. But for patients who receive multiple transfusions (such as leukemic patients who can require up to ten units of platelets daily during a crisis period), the two-way matching is not enough.

Each time a person receives blood from someone else, he risks developing antibodies that can attack foreign antigens (such as those from a blood donor) and destroy the transfused platelets. After multiple transfusions with blood from different donors, the patient can become completely unresponsive to the new platelets, destroying them almost as fast as they are introduced.

The troublemakers in these cases appear to be human leukocyte (called HLA) antigens—protein complexes that stud the membranes of platelets and other cells. Vital to the immune system in helping the body distinguish between itself and foreign matter, such antigens can cause problems for patients receiving needed transplanted tissue such as a heart, a kidney, or multiple transfusions of blood.

As specific to each individual as his fingerprint, the pattern of genes that code for antigens could never be matched exactly between any two individuals except identical twins. Fortunately, a mismatch of most antigens appears relatively harmless to patients. By carefully matching for the HLA antigens, which are known to cause trouble, physicians can avert the patient's "seek and destroy" response to the transfused cells.

Fran Bliven, R.N., monitors the procedure as Les Chibana becomes a "super donor" for the first time at Stanford.

Siblings often provide the best HLA match, but when a patient's need outstrips a family's ability to give, their only resort is to seek help from volunteer donors.

Stanford maintains a computerized list of 640 volunteers who have been HLA typed and have agreed to donate a component of their blood if and when it matches a patient's tissue type.

Burn encourages all those who donate whole blood to consider becoming apheresis super donors. Restrictions on who can donate are the same for both kinds of volunteers, except that super donors are requested to refrain from taking aspirin for three days prior to undergoing apheresis. (Aspirin interferes with the clotting action of the platelets.)

The number of times a volunteer will be requested to donate varies, but a typical super donor will be called to give once a week for two or three weeks in a year, Burn said. The larger the super donor pool, the greater the likelihood that several matches can be found, and the smaller the burden on any single donor.

Additional apheresis products are sometimes available through exchanges with other blood centers, Burn said, but because of the problems involved in shipping these fragile products, it is important to have as many local donors as possible.

"With a base of 2,000 super donors we could meet well over 90 percent of Stanford patients' needs," said Carl Grumet, associate professor of pathology and director of the Stanford Transfusion Service. "However, there's a complicating factor.

"In the Bay Area, we could have 2,000 Caucasian donors, but if a Chinese patient came in who had a type that was extremely rare or nonexistent among Caucasians, we'd have trouble finding a good match. We really need more non-Caucasian donors." (HLA types are not strictly tied to race, but a few types appear more commonly in some ethnic groups than in others.)

The need for apheresis blood products is growing all the time, Grumet said. An even more urgent need for both platelets and white cells will develop within a few years once Stanford's bone marrow transplant program is established.

Often apheresis matching takes on the character of an intensely personal drama.

In late September the Blood Bank began selectively harvesting young red cells for Brian Pavon, a Bay Area six-year-old who has beta-thalassemia major.

In this rare disease, the oxygen-carrying component of the red cell is defective, withering and misshaping the cell structure and speeding its destruction long before its normal 120-day lifespan.

Because his body can't adequately replace the

Some staff to vote in union election

An election has been scheduled Nov. 5-6 on the issue of whether about 1,200 service and maintenance workers at Stanford University Hospital wish union representation.

The election was ordered earlier this month by the National Labor Relations Board following a petition by Local 715 of the Service Employees International Union AFL-CIO.

Eligible to vote are a variety of job categories, including nursing assistants, unit service assistants, housekeeping and dietary workers, and maintenance employees.

No employees are now represented by Local 715 at the Hospital, a wholly-owned non-profit subsidiary corporation of Stanford University.

The only union bargaining unit now at the Hospital is the Committee for the Recognition of Nursing Achievement (CRONA), which represents about 1,250 registered nurses.

At the University, a Local 715 contract covers a bargaining unit covering 1,350 workers.

SUPER DONOR . . .

continued from page 10

cells he needs to meet his body's oxygen needs, Brian must rely on monthly transfusions of packed red blood cells.

But the gift of life carries a nasty chaser: frequent transfusions poison the body with more iron than it can handle. While the short-term effects are few, monthly transfusions year after year take their toll on a growing body, and thalassemic adolescents and young adults often die of congestive heart failure associated with the accumulated iron overload.

Because red cells normally live up to four months, by giving Brian only the youngest red cells (neocytes) via apheresis, his transfusion frequency may be reduced by as much as a third, thus cutting down his risk of iron overload. If the procedure is successful, it will used for other thalassemic patients, Burn said.

The future of apheresis may be bright in further honing medical treatment, but its success depends ultimately on volunteer blood donors, she added.

"The key thing is having a larger donor base," said Fran Bliven, an apheresis nurse at the Blood Bank. "We can have all the expertise and technical ability to get a good HLA match, to get each patient the blood product he needs. But all that expertise is wasted if we can't get enough donors."

One typical recipient, a man in his early 50's, was treated with chemotherapy for a month at Stanford for his acute myelocytic leukemia. He needed platelets four or five times each week for three weeks last spring. Keenly aware of his family's debt to several strangers, the patient's son wrote the following open letter to volunteers who were donating platelets:

TO A BEAUTIFUL PERSON:

I am the son of the man you are donating platelets for. I and my whole family think you are a wonderful, wonderful person and with your help and the Lord's we have come a long way with this disease.

You know our family is very close, and I can't imagine living a day without my father being there with us. With your help it looks like he is going to be here for a long, long time. The doctors have got this disease under complete remission. In about ten days from today he will be coming home.

Thanks again. We love you!

Award commends mortuary's generosity

Stanford University Hospital's first community service award has been presented to Charles and Rose Jones of East Palo Alto for what was termed "a lesson in lived compassion."

Mr. and Mrs. Jones, owners of the Jones Mortuary in East Palo Alto, were commended for their distinguished service to the Hospital and community. They were presented with a plaque in grateful recognition of their unique contributions.

Over the past six years, the Jones Mortuary has provided burial services, free of charge, for more than 100 SUH babies and stillborns less than 30 days old—a service many insurance companies do not cover. Director Charles Jones has made special arrangements and allowed discounts on his services in many adult cases as well.

Dean Robert Hamerton-Kelly of the Stanford Chapel remarked at the ceremony, "When I hear about people like the Joneses, I have two responses: humility, and exhaltation at an instance of such humanity, which makes us all feel better about the human race."

He added that what the Joneses do "lies beyond our ability to honor," and thanked them fot a "lesson in lived compassion."

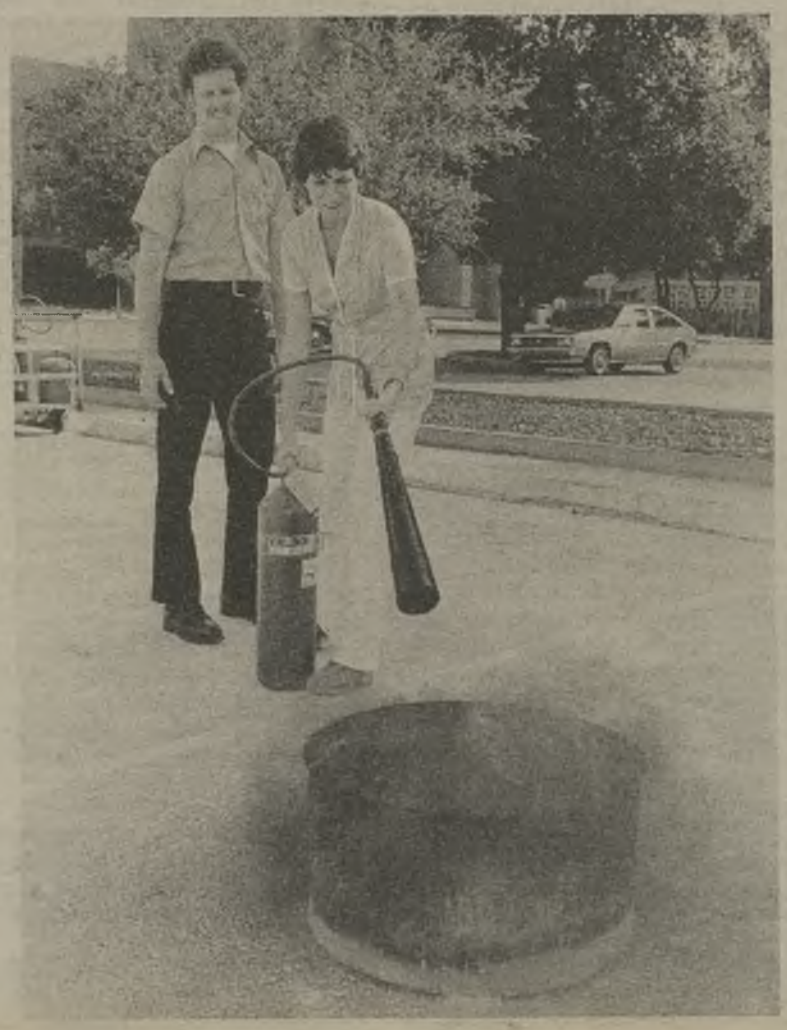
Presenting the award, SUH director Sheldon King said, "The Jones' generosity respresents devotion to the community beyond that which most of us are capable."

Dr. Lawrence G. Crowley, vice president for medical affairs, said that the Jones' reception is expected to be the "first of many occasions like this, for presenting community service awards." He added, "Without the help of volunteers, our tasks would be impossible. This type of service improves the overall quality of the Hospital's mission."

Present at the event along with other special guests were Mayor Fred Eyerly of Palo Alto, and Mayor Barbara Mouton of East Palo Alto.

The Joneses chat with SUH director Sheldon King (left) after the plaque presentation.

Director of Community Relations Jeanne Kennedy explained how her office, in conjunction with the Chaplains Office and Social Services, had worked to bring about the award. A brass plaque, said King, will hang prominently in the Hospital to honor the award and list present and future recipients.



The Jones Mortuary's generosity is largely due to Rose's childhood memory of a baby brother's death, when her family could not pay for the burial right away. She hoped never to see another family go through what hers had.

"It was important to me to provide this service free of charge, because people don't always have the money," she said.

Charles Jones dedicated half of the award to his mother, who died last month. "I would have wanted her to see this," he said.

Last January, the Jones Mortuary was a victim of criminal arson. The destruction caused by the fire resulted in an estimated $250,000 worth of property damage. The Joneses said they hope their building will be ready for use again by November.

SUMC staff taught to put out flames during safety week

The Palo Alto Fire Department last week paid a visit to Stanford as part of the Hospital's annual health and safety faire. Members of the Department demonstrated, in a controlled environment, the practical use of portable extinguishers on actual fires. Here, employee Julie Silveira of the diagnostic radiology clinic practices what she's just learned, as instructor Ken Cardinale of the Fire Department looks on. Other activities that day included indoor booths, with discussions centering on home lock systems, whistles, smoke alarms, residential fire safety, crime prevention, and more.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Johnson (left) confers with her supervisor, Alexandra Lampert.

SUMC, Bobby Sox team share a leader

Ann Johnson, administrative assistant in the Department of Pediatrics, remembers when she was doing the flip side of her present job.

"I worked with Rosemary Hornby's human resources group from 1976 till about a year ago, and everything I learned there really helps me a lot now," she said, explaining that her main "turf" in Pediatrics is personnel matters within the department.

"I know what the School is dealing with, personnel-wise, what they expect of me, and therefore what I can expect from them," she said.

Johnson feels at home at Stanford in other ways, having started in the Psychiatry Department from 1969-72. Her mother, a lab technician, has been here since 1961. "We're a Stanford family," said Johnson, listing her other connections here: a sister, her daughter's boyfriend, her father's girlfriend.

In her capacity as administrative assistant, Johnson said employees come in to see her for policy information, with problems regarding supervisors or staff, and questions about taking classes.

Johnson handles another special program in the department, involving a fund established by the California-Hawaii Elks organization to aid child patients.

"We use the money to help families of children and infants who are hospitalized or outpatients here," Johnson said. "The fund generally helps with such expenses as motels, transportation, food, and sometimes funerals.

"Many families are from far away and don't have enough outside resources. We like to be able to help with extra little things as needed." Johnson explained that the pediatric social workers make contact with her when they feel a particular case warrants aid from the fund, which the Elks contribute to on an ongoing basis.

Her work is only one part of Johnson's busy life. The daughter she's raised alone, Sonja, is now 16, so Johnson has lots of time for herself. Lately she's been modeling in the fashion shows, weekends and evenings, of a designer friend.

She likes to roller skate, bike ride, and go camping too, but the most fun Johnson has is with the girls of the Bobby Sox team she manages. "We laugh a lot, but they also know I'm an authority figure."

Johnson first got involved with the Bobby Sox when Sonja, now an umpire, joined at age 10. Every girl aged 9-15 who signs up for Bobby Sox softball gets to play, said Johnson. "Intensive practices often turn into farces."

As a manager, said Johnson, "I walk the sidelines, bite my fingernails, pull out my hair, and jump up and down screaming, 'Why did she do *that?!*' "

Johnson likes to play softball herself. "But I'm not too proficient at it, and I'm certainly not the coach. At practices the kids usually tell me to sit down and watch!"

Johnson, who lives in Mountain View, recalls a period of three years when she served simultaneously as a girl scout leader and Bobby Sox manager. "And one of those years I also headed a parents' group at Sonja's junior high school."

As a single mother Johnson says her life is easier now that Sonja's older. "My life was always centered around her and my job, and that took lots of energy. I liked to keep Sonja involved in lots of activities."

And the same seems to hold true for herself. "I'm just not the kind of person who likes to go home after work and sit. I like to do things," she said, confirming the obvious.

—Lisa Ames

Medical Center Calendar

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservation required. Call 497-6389.

PUBLIC EVENTS

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

WEDNESDAY, OCTOBER 27

Div. of Hematology Conference: "Expression of Oncogene in Normal and Transformed Lymphoid Cells"—Dr. William Schubach (Fred Hutchinson Cancer Research Center, Seattle). Noon, S102d.

Dept. of Neurology Grand Rounds: "Reaction of the Substantia Nigra to Massive Basal Ganglia Infarction"—Dr. Lysia Forno. 5 p.m., Palo Alto Veterans Administration Medical Center, room B108, bldg. 7.

Dept. of Medicine/Infectious Diseases Basic Science Research Colloquium: "Mechanisms of Interferon's Actions"—Dr. Thomas Merigan. 5 p.m., Fairchild Auditorium.

Puberty Education Course: "What's Happening to Me—Learn About Your Changing Body." For boys and girls ages 10-12 and their parents. 7:30 till 8:30 p.m., Children's Hospital at Stanford. Series also offered starting **Nov. 3.** For further information, call Dr. Paula Duke at 327-4800, ext. 538.

Div. of Orthopedic Surgery Grand Rounds: "Traction Techniques"—Dr. Norman Kane, 7:30 a.m., M114; and "Mini Total Hip Replacement"—Dr. Steven Woolson. 8:30 a.m., M114.

THURSDAY, OCTOBER 28

Dept. of Medicine Grand Rounds: "Neurobiology of Ganglioside Storage Disease (or 'When Neurons Get Bent Out of Shape')"—Dr. Dominick Purpura. 8:30 a.m., Fairchild Auditorium.

Dept. of Pharmacology Seminar: "Combinatorial Splicing as a Mechanism for Increasing Peptide Diversity in the Neuroendocrine System"—Dr. Ronald Evans (Salk Institute). 4:15 p.m., Pharmacology Library, R358.

Friends of Psychiatry and Behavioral Sciences: "Psychobiology, New Approaches to Mental Illness"—Drs. Thomas Gonda, moderator, and Jack Barchas, speaker. 8 p.m., Fairchild Auditorium. For further information, call 497-6376.

FRIDAY, OCTOBER 29

Dept. of Pediatrics Grand Rounds: "Bulimia"—Dr. Iris Litt. 8 a.m., M106.

Dept. of Biochemistry Seminar: "Viroida and Virusoids: How are they Related in Structure and Function?"—Bob Symons (Univ. of Adelaide, Australia). Noon, M316.

Child Psychiatry Grand Rounds: "Termination of Psychotherapy"—Dr. Jack Edelstein. 11 a.m. till 12:15 p.m., Children's Hospital at Stanford, Faber Auditorium.

Surgical Pathology Conference: "Interesting Derm Cases"—Dr. David Deneau. 8 a.m., L201.

MONDAY, NOVEMBER 1

Stanford Help Center: "Stress and the Housestaff Family"—Sharon Levin, L.C.S.W. 7 till 8:30 p.m., administrative conference room, Children's Hospital at Stanford. To register call 497-4577.

NOVEMBER 1 THROUGH 6

Postgraduate Medical Education Course: "Intensive Care." 7 a.m. till 5 p.m., Fairchild Auditorium.

WEDNESDAY, NOVEMBER 3

Div. of Orthopedic Surgery Grand Rounds: "Anatomy—Elbow, Forearm, Wrist"—Dr. John Kofoed. 7:30 a.m., M114.

Dept. of Dermatology: "The Inflammatory Process in Human Skin"—Dr. L. Dubertret (Heri Mondor Hospital, France). 8 a.m., Dermatology Library, R136.

Dept. of Structural Biology: "The Genetics of Myosin Assembly"—Dr. Henry Epstein (Baylor College of Medicine). Noon, Fairchild Bldg., D102.

Puberty Education Course: See **Oct. 27** description above.

Calendar items must be received in the Office of Public Events, 800 Welch Road, Suite 221, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

...News Notes...

Dr. William Dement, director of the Stanford Sleep Disorders Center, has been awarded the Nathaniel Kleitman Prize for distinguished service in the sleep disorders field.

The award was presented to Dement at the annual meeting of the Association of Sleep Disorders Centers Oct. 23 in St. Louis, Illinois. It is intended to honor contributions in the field, particularly "for those persons who have given generous and selfless efforts in the areas of administration, public relations and legislation."

* * * *

The Department of Cardiovascular Surgery has moved from its former offices in A206 to room A309. The phone number, 497-5771, will remain the same.

* * * *

The Auxiliary this month purchased two fetal heart monitors for the Hospital, at a total cost of about $21,000.

While Marion O'Brien-Adineh is on maternity leave (until January), Pat Toomey will be in charge of the Medical Records Department, announced Carole Price, SUH associate director.

Toomey has served as manager of Transcription Services. In the coming months, she will handle daily operational issues for the entire department in addition to her other responsibilities. She can be reached at 497-5617.

In addition, Patricia Stone from the Department of Health Services Planning will serve as consultant to the Medical Records Department. She will be in charge of such projects as department renovation, and development of a policy and procedure to comply with the new patient access to medical records legislation that becomes effective January 1. She is available at 497-7969.

Price can be reached at 497-5737 if any unforeseen problems arise.

Medical Center security officer tells how to help prevent thefts from offices

With the coming of the fall and winter seasons, an increase in attempted thefts can be expected at the Medical Center, warned Hilary Ryniewicz, director of Safety/Security Services.

All employees are requested to follow the same precautionary measures relating to their personal items within SUMC buildings and grounds as they would in public parking areas, theaters, restaurants, hotels and other public places.

Ryniewicz listed several specific steps departments and individuals should take:

• All purchased equipment should contain the manufacturer serial or identification number. A department record of numbers should be kept and filed for theft reporting. The Engineering Department will loan, on request, an etching tool to allow departments to mark equipment with appropriate identification numbers. Personal items should be marked with the owner's California Drivers License number.

• Typewriters, computer equipment, and other office equipment should be secured to the desks. For office, clinic, Hospital, and lab equipment, specialized locks are available through the Master Locksmith's Office. Engineering work orders should be submitted for hardware and installation. "It is economical to invest $30 for a typewriter lock versus the loss of an $800 piece of equipment," Ryniewicz pointed out.

• Purses, wallets, and other personal items should not be left unattended. "Placing purses and valuables in unlocked desks and cabinets is no assurance they will not be stolen," said Ryniewicz. Valuables should be kept in locked cabinets or desks. "The best protection is to carry your valuables at all times."

• Sums of money should not be kept in locked desks overnight, since locked desks are easily pried open. All petty cash funds should be turned in to the Cashier's Office. Any department dealing with large sums of money should make more frequent deposits, thereby lessening the potential amount of the loss.

• Unrecognized or unauthorized persons in any area should be asked, "May I help you?" or "Are you looking for someone?" This, said Ryniewicz, will normally cause some hesitancy on the part of the individual if a theft is intended.

• Security officers can be reached at the Facilities Protection Office, 497-7222 or 497-7223. These numbers or Communications "86" should be called for assistance and to report any suspicious activity or persons.

• An escort service at the main center is available from 10 p.m. till 12:30 a.m. A motorized vehicle patrols the north, west and south SUMC parking lots, offering rides to incoming personnel for delivery to the main Hospital entrance after a complete tour of the lots has been completed. The vehicle passes the main Hospital entrance every 10 minutes to pick up outgoing personnel for delivery to indicated parking lots.

• An escort service at the Hoover Pavilion is available from 10:30 p.m. till 12:30 a.m. A patrol is stationed at the Hoover west entrance to provide escort for incoming and outgoing personnel. A motorized vehicle patrols the Hoover lot "Q" and east SUMC parking lots, for the protection of all incoming and outgoing personnel.

• Anyone desiring escort service at other than the indicated times should contact Communications at 497-5931, which, in turn, will radio Facilities Protection personnel to arrange for a convenient meeting place and time.

'Tranquillity,' a painting by Win Belton

I-Center shows acrylics by Win Belton

Acrylic paintings by Win Belton, an art teacher at Palo Alto High School, will be shown at Stanford's International Center Nov. 3-30.

A reception honoring the artist will be held from 5 to 7 p.m. Friday, Nov. 5, at the Center.

Born in Louisiana in 1939, Belton moved to Arizona with his family when he was four. Throughout his childhood and teenage years he spent long hours drawing and painting in the desert, growing to love the rich earthy colors, the vast expanse of uninterrupted space, and the beauty of rock formations and mountains.

"The desert taught me that there is beauty in simplicity," says Belton. "This affects my art even today."

While much of his earlier work used the desert and nature as subject matter, he worked in a large abstract manner in a later period, still influenced by the desert and Hopi and Navajo Indian cultures.

The paintings in the International Center exhibition are from subject matter and impressions gathered during recent trips through Europe and this country—"For the most part I have attempted to maintain simplicity, but clarity, in form and color," says Belton.

Belton has a bachelor's degree in education with a major in art from Arizona State University and a master's degree in art education from Northern Arizona University in Flagstaff. He has been on the faculty of Palo Alto High School since 1969.

Japanese films directed by Kurosawa featured in new series at Annenberg

Ms. Audie Bock, an authority on Japanese film, will speak before the opening film of a series by the great Japanese director Akira Kurosawa at 7 p.m. Thursday, Nov. 4, in Annenberg Auditorium on the Stanford campus. A reception will follow.

The series will present three of Kurosawa's greatest films, under the sponsorship of the Committee for Art at Stanford and the Japan Society of Northern California.

Bock spent four years in Japan as a teacher and editor after earning a bachelor's degree from Wellesley College. She is the author of *Japanese Film Directors* and the translator of Kurosawa's autobiography *Something Like an Autobiography*, published by Alfred Knopf last spring.

Bock, currently a Ph.D. candidate at Harvard, also served as assistant producer of the international version of *Kagemusha* under George Lucas.

The films, all except the first at 7:30 p.m., are:

Nov. 4: *Throne of Blood*, Kurosawa's astonishing translation of Shakespeare's *Macbeth*. ($4, $3 for students, including lecture and reception);

Nov. 11: *Ikiru*, the story of a dying man who makes a passionate effort to find out what it is to really live. ($3, $1 for students);

Nov. 18: *Seven Samurai*, Kurosawa's best-known movie, in which a village hires a small band of masterless samurai to save them from marauding bandits. ($3, $1 for students).

Savoyards seek early memorabilia

The Stanford Savoyards will celebrate their 10th anniversary as the resident Gilbert and Sullivan company with a G & S gala in April, 1983.

Performances will be held in Dinkelspiel Auditorium on April 15-17 and April 22-24. Social events for returning Savoyards' alumni will take place the second weekend.

Copies of early programs, cast lists and pictures are needed, and may be sent to Stanford Savoyards, ASSU, Tresidder Union, Stanford, Calif. 94305.

Some faculty and staff decide to accept $5,000!

Don't let your beneficiaries down—put their names on the $5,000 life insurance policy Stanford has provided for each faculty and staff member.

The open enrollment period for the new life insurance plan will end Nov. 10. Many faculty and staff have named beneficiaries, but more have not.

The money could be crucial to a family in the event of an employee's death. If a family member is named as beneficiary, he or she will get it immediately—if not, the money will go into the employee's estate and be unavailable for a period of time.

So return the enrollment form as soon as possible to the Benefits Office. If you have questions, call or visit the special life insurance office in the Old Pavilion, ext. 7-0757, between 9 a.m. and 4:30 p.m., including the lunch hour.

Health care cost limits threaten academic hospitals

Following is an address by Stanford President Donald Kennedy given Oct. 22, on the occasion of the Harvard Biological Laboratories' 50th anniversary:

Old friends and colleagues: it is a great pleasure to be with you on this occasion — at least it is mostly a pleasure. I do find it a little hard to face the fact that I completed my own eight-year term in and around this building during the first half of *its* life, not to mention the first half of *mine*.

Like all of you, it has aged gracefully. Indeed, in some ways it seems to have grown younger. For example, it would not appear necessary today to resort to the Welsh elevator algorithm.

Some of you may recall that the balky elevator at the back corner of the more zoological side of the building could never make up its mirid where to go when two people on different floors pressed the call button at approximately the same time — so it simply stayed where it was. Because the residents of all floors appeared to be equally stubborn about not releasing the button to end the deadlock, the Welsh algorithm was developed. It permitted one to keep the button depressed one second for each year of one's age. That would appear no longer to be necessary.

The remarkable thing about this young/old building though, is how it was built; and that brings me to my subject, which is: how we are going to do biology in the next fifty years?

The Harvard Biological Laboratories, in contrast with almost all other places in which modern biological research is done in this country, were built in the Depression, with private money. Now, the Depression was not a bad time to build something; it had what we now call, in facilities buzz-language, "an excellent bidding climate." But it is awfully hard to find much foundation-financed construction around these days. I doubt that more than two or three private foundations are sinking serious money into buildings of any kind, and especially into research buildings.

Instead, the array of science laboratories now decaying slowly on our nation's campuses were nearly all built by federal programs in the late 1950s and 1960s. But in 1968 the last Federal budget line for health research facilities construction died. In the fourteen subsequent years, not a single significant addition to plant, save a few special cancer facilities, has been financed primarily with federal dollars.

Bricks and mortar

And as for private money of the kind Harvard and Stanford are practiced at raising, it is getting harder and harder to find support for bricks and mortar. A recent Cambridge Associates survey of capital campaigns recently concluded by leading private universities shows that whereas these campaigns in the aggragate, exceeded their goals by 4%, they undershot their capital facilities goals by 35%. Three campaigns under way now, including Harvard's, have raised 68% of their total goal, but only 31% of their combined physical plant goal. So fine research facilities like this one are to be treasured like the slowly maturing clarets of the 50s, and for the same reason — There Aren't Going To Be Any More!

Of course, research can go on despite certain handicaps. Here in the Biological Laboratories we regularly overcame hordes of ants, the aforementioned balky elevators, and escaped flies from the insectary that were, in Fred Hisaw's words, homozygous for impertinence.

But surely we will someday have to do some replacement. And our national problem with aging research facilities accurately represents a much larger challenge that faces biological research in the next half-century — a challenge to which I want to turn in the rest of this talk.

Since 1967, the Federal non-defense budget for scientific research has shrunk by about 37%, and half of that reduction has taken place in the first two years of the decade of the 1980s. That trend is likely to get worse over the next few years, and it may be exacerbated by peculiar events. We live in a time of mysterious, suddenly-appearing government initiatives. Two examples are the NIH's almost- successful effort this year to make off with 10% of the indirect cost reimbursements they owed to the universities in which the work was taking place, and the passage of a Small Business Innovation Act that will set aside more than 1% of the government's basic research money for product innovation in the profit sector.

That's not all. Coupled with the problems of non- replacement of facilities, and of dwindling direct support of research, there is a chronic liability: the deterioration of major research equipment in university laboratories. A recent AAU study documents how rapid changes in instrumentation technology, coupled with the difficulty of financing large pieces of equipment, has resulted in an increasing gap between the very best equipment and that available in most universities. Both Congress and the Administration sources became fully convinced on this point three years ago, and the last Carter budget contained a $100 million line for capital equipment outlays in the universities — a down-payment on what was estimated to be a billion-dollar shortfall. That supplement to the National Science Foundation budget was eliminated when the new Administration came into office, and any hope for special support for equipment has since been abandoned.

To complete this brief but dreary chronicle, I want to spend an extra few minutes on what may turn out to be the most serious matter of all — the threat to the academic medical centers, where much of the biological research in this country is actually done. Their health — both fiscal and intellectual — depends upon their ability to maintain teaching hospitals of first quality. But current government policies are now making that difficult, and soon may make it impossible. Though that issue may seem a little distant to this group, I assure you that it is of overwhelming importance to the overall success of biological research.

The problem, in a nutshell, is the high cost of hospital care. Two approaches to that problem are being taken by federal and state governments: The first is to control costs by limiting reimbursement, and the second is to provide what is called "competition" in the hospital sector. Both approaches sound perfectly reasonable, and yet both are having disastrous consequences. The first effect of reimbursement limitation is, of course, that it raises hospital charges to private patients; hospitals have fixed expenses, and must cover these with revenues. At Stanford University Hospital, for example, if the government paid the full cost of care for Medicare and Medicaid patients, *it would be possible to reduce overall patient charges by 14% tomorrow*

The vulnerability of academic health centers to reimbursement limitation is, furthermore, especially serious because of the severity of their caseloads. Half a dozen Medi-Cal infants in our Neonatal Intensive Care Unit who significantly exceed the average length of stay can have a significant impact on a year's budget because reimbursement is limited by admission and the additional costs of those severe cases fall entirely on the hospital.

The worse thing about reimbursement limitation is that it is such bad policy. What it does, in effect, is to shift the burden of caring for the medically indigent from society as a whole—that is, the taxpayers—to those members of society who happen to be sick, and their insurers. It is a scheme so bizarre that it is hard to believe that it could have been invented by a civilized nation.

The other cost-control strategy involves competitive contracting for hospital services provided to State or Federally supported patients. There is a certain appealing, free-enterprise ring to the word "competitive," but on careful examination that turns out to be just about all this policy has going for it. In any straightforward price competition, the routine (and, it turns out profitable) business will go away from the academic health centers to county hospitals or even to proprietary institutions.

What's wrong with that? After all, people have been arguing for some time that teaching hospitals are more expensive because they load costs properly attributed to research and to training onto the patient's bill. But in fact that is wrong. A number of recent studies — notably a recent one done at Johns Hopkins — have shown clearly that the added costs associated with care in academic health centers has to do with the severity and technical complexity of the caseloads handled there. As smaller hospitals "compete" successfully for routine care, there will be further concentration of the difficult cases in academic centers, followed by further increases in charges to cover the inadequacy of reimbursement. The shortfall will widen, and the teaching hospitals will be driven to further distress.

That will, of course, be bad for research. Although it is not germane to my main point here, I would also emphasize that it is bad for patients. I am no practitioner of medicine, but I have been a teacher of medical students in two institutions, the chairman of a hospital board and of three different national committees on health policy, and the head of a Federal health regulatory agency. (I have also, I might add, been a patient.) From each of these vantage points, I have been impressed by the enormous quality spread in American medicine. There is a mythology to the contrary, much of it generated by the professional organizations of medicine. They are conspicuously devoted to the proposition that there shall be no second-*class* doctors; but it does not follow that there are no second-*rate* doctors.

Difficult cases

The cases that wind up at Stanford or MGH or Peter Bent Brigham are in substantial part there because of quality. These institutions get the difficult cases because they are good. Indeed, sometimes they get them because others are not: the second hip replacement is a more complex procedure when the first is bungled. So a particularly disastrous social consequence of inadequate reimbursement and "competition" is that the effect falls selectively on the institutions of highest quality.

Worse still, these policies are turning us away from an important national commitment to a single system of health care for rich and poor. We are now rapidly returning to a two-tiered system, one for privately-supported and one for publicly-supported patients. It will not take much of this to end the notion of health-care democracy in this country.

Nor, to return to the main point, will it take much of it to put the teaching hospitals out of business, and to make enormously more difficult the doing of biomedical research. To many of you, it may seem a little perplexing that I've spent so much time of this problem when the cuts in research support or the state of facilities and equipment seem to impact our work more directly. But my view of the budget situation is now a little different, and I can tell you that, from here, the total financial threat to research activity now looks larger from this source than from all the others combined.

What I have said so far is that the future of biological research is seriously threatened if we look only at its traditional sources of support: that is, government policies designed to encourage scientific work in general, and those framed specifically to support the health mission. Are there other social purposes to which we might turn for some sign of hope?

The first one we might think of is agriculture. After all, the Rockefeller monies that built this building came from a set of social concerns that combined agriculture and health; and agriculture is the other major outlet, in addition to health for the application of new findings about living systems.

The difficulty here is, of course, that we have developed a unique system of funding research related to agriculture. It involves a special set of institutions, the land grant universities and state agricultural experiment stations, and federal formulas that govern the distribution of funds among them. From time to time, it is suggested that the way in which we support basic research related to health would work better; within the past ten years no less than three major national committees have criticized the formula-funding system and the state of agricultural research in this country, and have suggested alternatives more like the health model.

In 1976-77, when I was serving as senior consultant to the new Office of Science and Technolgy Policy, several of us worked very hard to establish an investigator-initiated program of competitive basic research grants in the Department of Agriculture. Against rather long political odds, we succeeded; but each year the program has been under heavy threat in the appropriations process, and it has barely hung on at an annual level of a few million dollars. The political leverage generated by the regional character of agricultural research funding is very difficult to overcome; the smell of pork hangs heavily in the air. For that reason I foresee little help from this source.

Private funding

The other prospect, now discussed with enthusiasm wherever one goes, is that private industry is suddenly interested in basic research and will step in to support it. A few large programs in a few institutions make this prospect seem the more real, especially since the dollar amounts are reported in terms of endowment rather than operating income.

Even the handful of institutions which have been successful in getting these large projects know that they support work of a rather limited and special character, and that in terms of the total financial needs of the research enterprise they represent a drop in the bucket.

The real situation is better reflected by the total figures. About two-thirds of all the basic research done in the United States is done in the research universities. Of the *total* of all university research budgets, between three and four percent are now met from industry sources. Thus to make up for a one percent drop in federal support, we would have to increase industry's support by 25% That seems to me a very difficult equation, without even reaching the question of whether most of the money would be available on terms acceptable to most of us.

Well, since I don't believe that foundations are likely to return suddenly to the support of research facilities and equipment, since individual donors are not inclined to support such things either, and since I see little hope of rescue from the other applied sector of biology or from private industry, what can I possibly offer by way of a solution?

My conclusion is simple, and it won't surprise you. I think it is perfectly plain that a vigorous and creative research establishment in biology and in the other basic sciences is a social obligation of the most serious kind; and that only the public sector is capable of meeting that obligation. It follows that appropriate policies should be put in place to get it done.

The underlying rationale is that our national productivity, as well as our national health, depends upon a continuing stream of innovation; and that a vigorous research establishment is a fundamental requirement for innovation.

In the case of biology, the relationship of fundamental research to the two great areas of application — agriculture and medicine — should be explicitly recognized, in a way that provides the best possible linkage between high-quality application and the full spectrum of institutions in which basic research is done. To accomplish these objectives, we will need to support basic research, the capital facilities for doing it, and the affiliated institutions in which applications can take place.

Well, doesn't that simply run up against the reality that in this day of expanding budget deficits, everyone must share in the cuts? I think we simply must declare that investments like this one, which involves the future intellectual capital for our society, *have* to be preserved—even at the expense of compellingly attractive alternatives. We need to develop a more fiduciary attitude about programs on which our more distant future is likely to depend.

Not only do we need a new set of budget priorities; we need to examine the policies that govern our institutional arrangements for doing biological sciences. They have been revised in haste, even desperation, to meet current economic exigencies, and as a result their convergent effects are haphazard and often unexpectedly damaging, as in the example of the academic health centers.

So although we must start by recognizing that budgets for the direct support of fundamental research must be maintained and increased, and that our rolling liability in capital equipment and

Libraries committee revises description of visiting scholars

Following is a report of the Academic Council Committee on Libraries for 1981-82:

RLIN

A major concern of the committee this year has been the problems of the Stanford-based computer system called the Research Libraries Information Network (RLIN). Through the director of the libraries, David C. Weber, and the associate director for Technical Service, James N. Myers, we were kept informed of the problems as they affected the working of our own libraries.

The chairman of the committee and David Weber spoke to the Senate in November of 1981, on the occasion of the Senate's discussing the previous annual report, about the serious backlog in cataloging. We invited Edward E. Shaw, then president of RLG, the interuniversity corporation responsible for RLIN, to talk to us on December 7th. The discussion proved to be very general and theoretical and left the committee rather disturbed and far from confident about the administration of RLIN at the time. The committee was probably not sufficiently aware of the particular problems of RLIN to ask useful questions.

We did advise the Associate Director for Public Services, Dale B. Canelas, in the drafting of a report on the problems the libraries were having as a result of RLIN's troubles, and this appeared in the *Stanford Daily* and *Campus Report*. The committee also encouraged Technical Services to set up a means of ascertaining the receipt of new books via Stanford's own CIT.

It would be helpful for the committee to have regular communication with the President of RLG or a very well-informed assistant and this is recommended as an item for the committee's agenda each year. It should be added, however, that the committee has expressed no doubts but that the implementation of a network such as RLIN is necessary and desirable and it hopes that growing pains will soon be overcome.

Branch Libraries

C-Lib continued and completed its discussions with the libraries of all the branch libraries and their committees. This has been a useful process, reassuring us in general of the highly successful operation of the branches but also bringing to our attention problems that do not arise in Green and Meyer.

Space problems have proved to be almost universal. There have been delays in receiving current periodicals; studies conducted by the central library staff seem likely to have reduced this to a bearable level. Some branches, such as engineering, have heavy non-Stanford use, and this involves greater than usual problems of security. Engineering, it should be ofted, also conducted a review of the periodicals it receives and made sizable savings in its budget by eliminating those not regarded as necessary.

Branch libraries are designed to serve a specific campus community. But there are times when unique holdings in one library are essential to the work of people not based in that library and who are hindered by its rules.

We examined such a case, that of the Latin American Studies Committee whose constituency needs to have greater access to materials held in the noncirculating art library, which, furthermore, does not normally give undergraduates access to its stacks. (Limited circulation is available to faculty members only).

The solution apparently lies on one hand in the branch library making accommodations for these special needs, and on the other for the relocation of books by agreement from the branch library to Green. The faculty may not be sufficiently aware of this possibility and, although it is a time-consuming process, costs are seldom a major barrier. A related problem is that of auxiliary storage, which may contain groups of books or periodicals for which browsing is still felt to be important. Here too considerable flexibility on the part of the libraries is possible.

Services

Review of the process of annually renewing or recalling faculty overdues has shown that many books have in effect been recovered for the library system, a fact that both enriches the libraries and prevents the need for costly replacements. The process, however, is in itself expensive and the committee has recommended the elimination of certain steps which should save time and money.

We have had considerable discussion of the privileges accorded to visiting scholars. The numbers involved have increased strikingly in recent years as a result, it is believed, of a certain lack of care in granting this status by departments and also because of the larger category of academically unemployed recent Ph.Ds.

On the other hand, such courtesy by Stanford to visitors (as opposed to faculty and graduate students regularly located in the Bay Area) constitutes very large if often intangible benefits to Stanford faculty and students.

The cost is now estimated to be about $1,000 per visitor each year. Stanford's fees of $200 for visiting academics who are not designated visiting scholars by a particular department compares with $750 for Harvard, $600 for Columbia and $500 for Yale. A revision of these fees to $500 seemed reasonable to the committee, and a revised description of the criteria for visiting scholars has been prepared. **(See accompanying text.)** This will be forwarded to the C-AAA for their discussion.

Meanwhile the University's desire to be helpful to visitors is seen in the provision of a room for up to 18 visiting scholars within the stacks, to be accessible by key, and in arrangements made with San Jose State University this past winter to help faculty while that university's library was temporarily closed.

A continuing subject of discussion has been the feasibility of instituting an automated circulation system for Meyer Library and Green Library, already in operation in a number of major libraries elsewhere. Against the considerable cost for the installation of such a system is the incalculable benefit to users in obtaining information quickly on the whereabouts of an item that is needed. Recent brushes with computer-generated disaster may have induced a degree of caution about embarking on this venture but it seems only a matter of time before automation comes about.

A minor but positive means of lessening the time required for getting a book in hand is the box labeled "borrower's name may be disclosed" on charge slips. But at present only 35 percent of users check this box. When the present charge slip is reprinted the form will be redesigned to make this box more prominent. Until that happens all library users should be aware of this option and the convenience it offers, e.g., letting a colleague get the information needed from the book quickly and returning it to the original borrower quickly.

Collection Evaluation

Attention to the constant problems of processing and circulating books and information may lead us to overlook the less conspicuous but even more fundamental task of collection development and evaluation. This is the only way in which we can hope to maintain the quality and utility of the library and it requires unflagging alertness and the close collaboration of a well-informed library staff with faculty and graduate students.

The committee has been most impressed with our achievements here, under the leadership of the Associate Director for Collection Development, Paul H. Mosher. To give two examples: eleven separate studies were conducted on our holdings in French and Italian, and 10 in the history of science. But the number of searches does not indicate the excellence of the results—that can be appreciated only by the grateful users.

Future Concerns

The retiring chairman of the committee passes on to his successor and colleagues some questions that have been raised and not yet answered: The operation of the Meyer Reserve System (to be reported on by the head librarian of Meyer); the bibliographic control of documents and the prospects for closer integration of the government documents division with the main catalogue; a similar problem with the cataloging of maps. A very immediate concern for the libraries is that of rising domestic book costs after a brief period of steady prices. It is possible that the increase for domestic acquisitions will rise as much as $250,000 in the coming year.

Finally, the university community should be aware of the unceasing and remarkable efforts of analysis of current operations and projected needs and desiderata which come from the library management, the University Library Council and the Provost's Task Force on Library Planning.

In a brief report such as this even a summary of the broad range of concerns addressed in the documents prepared by these groups is not feasible. Clearly the library staff, its advisory groups and this committee are always open to and eager for suggestions. Individual frustrations while working within a very complex system may reveal curable flaws or the beginnings of major problems of the future. But it must also be said that with a finite budget and staff and an infinitely expanding body of information there are inherent limitations in what any library can do. That too we the users need to realize.

Michael H. Jameson, chairman

VISITING SCHOLARS*

Stanford University has a substantial number of visitors each year working in the University for periods ranging from a single quarter to a calendar year. Stanford is glad to have them, for we frequently profit from their presence among us. As the number of visitors increases, however, it becomes more important to have a standardized method of accommodating them. This statement has been prepared for the purpose of describing to members of Stanford's faculty and staff and to the visitors themselves the privileges available to visiting scholars and the procedures established to identify them as members of the University community.

Definition:

A visiting scholar is ordinarily a holder of a doctor's degree from an accredited institution of higher learning in the U.S., or a person either from this country or from another country who is recommended by a member of the Stanford faculty as having equivalent training.

Categories:

Visiting scholars are at the University for two reasons:

1. Persons who are essentially students attending courses and seminars with a view to improving their professional position.

Qualification: Normally such persons would register on an attendance permit basis (see *Information Bulletin* for fees).

2. Persons engaged in creative research or scholarship in conjunction with a department or program and contributing substantially to the academic pursuits of the University. These persons should ordinarily be on the faculty of universities comparable to Stanford or on the research staff of major institutions. Their involvement with Stanford would consist of activities such as the following: full-time or nearly full-time participation in Stanford-sponsored research; full-time or substantial interchange or collaboration with Stanford faculty in scholarly writing; participation in a substantial advising capacity on doctoral theses or departmental matters; participation as a lecturer or seminar leader for a department or university-sponsored program. In his or her letter to the registrar, the department chairperson recommending the visiting scholar should indicate the way the scholar fits these criteria.

Qualification: When a department chairman writes to the registrar attesting to the nature of the University contribution to creative research or scholarship, the registrar will offer the privileges of the University and provide a courtesy card without charge as designation of this visiting scholarship for a stipulated period of months.

**Revised version proposed by C-Lib, May 1982.*

Miller may join National Science Board

President Reagan intends to nominate SRI International President William F. Miller to become a member of the National Science Board.

Former provost of Stanford, Miller serves part-time as professor of computer science and as professor of public and private management in the Graduate School of Business.

Members of the National Science Board are selected "because of their distinguished service in science, medicine, engineering, agriculture, education, public affairs, research management, or industry," according to the *U.S. Government Manual*, and are "chosen in such a way as to be representative of the scientific leadership in all areas of the Nation." The 24 Board members are appointed by the President with the advice and consent of the Senate, for six-year terms.

The National Science Board, in effect, establishes priorities for the National Science Foundation. According to the *Manual*, the National Science Foundation "assigns policymaking functions to the National Science Board.... The policies of theBoard on support of science and development of scientific personnel are generally implemented throughout the various programs of the Foundation."

Miller's nomination to the National Science Board is now awaiting formal submission to the U.S. Senate for its advice and consent.

Kennedy...

continued from page 14

facilities must be reduced, that will not be enough. These measures alone may fail, unless it is also recognized that other, often quite distant policies can do unexpected damage.

The process of policy *renovation*—and I think we are talking about nothing less — is very difficult and complex. The committee structure of the Congress is not well organized to undertake it, and it is hard to get the agreements in the Executive Branch that are necessary to orchestrate it.

But I reluctantly conclude that it is a requirement if we are to see, over the next 50 years, progress equivalent to what this marvelous building has seen in the last half-century.

When I first approached it as a freshman in 1948 to hear about biochemistry from Jeffries Wyman and his colleagues, it looked imposing and forbidding — rather like a monument. As I spent more time in it and became less awed, I saw in much more organic terms, as a bustling, creative enclave of people doing interesting things. I liked it better that way, and I surely hope that this society will not permit it to turn into a monument again.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

5423-VW (JCC:1996) UNIV MANAGER V: Dir of Stanford Univ Press; directs the editorial, managerial & financial aspect of the Press (approx. 35 staff; publishes approx. 40 titles annually; annual sales in excess of $1 million); sets publishing policy; sets budgets & other boundaries for genl publication & for specific titles; determines/authorizes number of copies to be produced; writes/signs all contracts w/ authors & others; QUALIFICATIONS: demonstrated successful exp in editorial, managerial & financial aspects of publishing in univ presses, or equiv exp elsewhere.; N11; $4166-OPEN.

36538-DS (JCC:2220) FINANCIAL MGR I: Respon for efficiently & effectively managing Univ's expenditure sys; mgmt of expenditure sections for high volume processing (Accts Payable/Payroll) incl existing computer sys; interface w/ mgmt in Procurement & Personnel depts for operation of existing sys & develop't of planned computer sys operating fr interdept'l data bases, incl develop't of on-line operating sys to serv needs of Stanford community; timely control, reconciliation, & updating of expenditure accts; financial analysis & risk assessment for expenditure operations, etc; QUALIFICATIQNS: MBA or equiv exp; 5 or more yrs successful exp managing expenditure or other acctg functions in a large complex organization; demonstrated ability in conceptual design & operation of computerized 1 expenditure sys; superior interpersonal skills, incl verbal & written commu; able to interact w/ all levels of mgmt & operations & w/ partners in interdept'l sys.; C09; $2972-3642.

Bargaining unit

24642-FM (JCC:5638) LIFE SCI TECH I: TMS Unit; simple small animal surgery; care of experimental animal; asst w/ histology (section & stain tissues); asst in experiments; lab organization; ordering of supplies; asst w/ computer analysis of data, dark room work, simple machine shop work; QUALIFICATIONS: familiarity w/ basic biology, esp physiology; willingness to learn surgery tech, histological methods, dark room tech & computer operation; ability to work well w/ other people; ability to handle animals; exp in any of the above areas desirable.; A18; $7.5.

36179-TC (JCC:5638) LIFE SCI TECH I: TMS Unit; Work on a proj studying the effect of age on the hypothalamic-pituitary-adr enal axis in rodents & man; proj involves small vessel cannulation, pituitary dispersion & cell culture, radioimmunoassay of ACTH, corticosterone & cortisol, immune precipitation & two-dimensional gel, electrophoresis; respon for the repetitive performace of these assays & recording of procedures & results for daily discussion w/ principal investigator or his post-doctoral associate; QUALIFICATIONS: Bachelor's degree in biology or endocrine physiology required; prior knowl of cell culture tech, radioimmunoassay theory & small animal surgery desirable.; A18; $7.5.

33569-JB (JCC:8890) MISC TECHNICIAN: Toxic Waste Tech picks up radioactive & chemical wastes fr lab on campus & Med Ctr; inspect, compact, & drum low-level radioactive waste; drum vials containing organic chemical solutions; package toxic chemicals for disposal; prep waste disposal kits & distribute to labs; order & maintain supplies for waste disposal; coord & participate in transfer of packed waste to outside contractors for ultimate disposal; analyze & test samples under the direction of Health Physics, Health & Safety professionals; QUALIFICATIONS: 18 yrs of age or older; a licensed driver; physical strength to handle containers up to 55 gallon drums, manual dexterity required; Jr. college level course in chem & modern physics desirable; accuracy, neatness, atten to detail, self-direction, & maturity.; A26; $9.1.

44517-AW (JCC:6398) SCI & ENGR ASSOC TRNEE: 5am-2pm or 12pm-8pm; working w/in Network Control Ctr to serv users & to support the central network staff; coord vender serv techs at remote sites; maintain & test network diagnostic equip't; follow specific operational & documentation procedures; maintain positive relations w/ users, vender-techs & staff; plan & implement construction & repair of cable & other network hardware; may work 80-100% depending on the availability of funds; approx 6 mos training; QUALIFICATIONS: prev exp in an interactive computer environ; good aptitude for data commu theory & application; effective commu skills, both oral & written; exp w/ proj coordination; prev customer relations exp or related conflict resolution duties; aptitude for procedure & proposal writing; aptitude for electro-mech wiring & troubleshooting.; C06; $1761.30-2196.

SLAC

94628-JM (JCC:8880) Program Planner: Develop annual dept'l expense & capital budgets; develop monthly plans of expenditures & manpower requirements; analyze detailed acctg statements; review & update plans; develop proj schedules (CPN) for work being performed by dept(s) fr developm't stage thru design, fabrication, installation & sys testing; prep written status & progress rprts; carry out studies of proposed new projs; participate in prep of long range plans of depts; QUALIFICATIONS: Industrial or Mgmt Engrg degree or equiv required; understanding of basic concepts of program planning; coursework prov training in budgeting & acctg for proj control, as well as critical path network schedule prep, updating, analysis & rprtg; ability to deal effectively w/ scientists, engrs & administrators; ability to commu effectively both orally & in writing.; C07; $2113-3432. APPLY AT SLAC

Nonexempt

25868-PM (JCC:2596) SECY II-SPEC: Work as fac sec for law profs as assigned to handle all classwork needs corresp, expense repts & travel arrangemts; answer phones, xerox, & at times, cut & paste for pre-pbulication; QUALIFICATIONS: typ 70+; excel typ skills; familiarity w/dictation/transription sys essential (s/h a plus); some prev business exp or law offc exp preferred; able to work under extreme pressure, esp related to publishing deadlines; must be detail-oriented & have shown demonstrated ability for making respon judgmts & setting own work priorities; will train on computer/word processor eqpt as needed; send appl/resume to Dana Landsman, Rm 113, Crown Quad, Law School; B12; $1310-1373

20575-BP (JCC:2454) OFFICE ASST II: 50%, 1-5pm; share job; heavy telephone answering; sort I-D mail; filing; prep basic Immigration forms for students on request; prov sec'l serv to staff members; relieve receptionist at front desk as needed; schedule I-Ctr

Hospital

Submit applications to the Hospital Personnel Department, 770 Welch Road, or call 497-6361.

SR. EMPLOYEE/LABOR RELATIONS SPECIALIST-Employee/Labor Relations—#5136—(R-102): RESPONSIBILITIES: Under the genl supvn of the Asst Director of Perosnnel Mgmt, provides guidance & training to the Employee/Labor Relations Staff; recommends & assists in writing personnel policies & procedures & provides guidance to mgmt in interpreting & enforcing personnel policies & State & Federal laws; reviews & counsels regarding corrective action & progressive discipline, investigates employee grievances & EEO/NLRB complaints; provides guidance to Hosp employees on work-related problems; performs special projects as assigned; QUALIFICATIONS: Bachelors Degree in Labor Relations, Business Administration, or a related field & a minimum of 3 yrs' experience in labor relations preferred; working knowl of State & Federal laws, including unemployment insurance is reqd; experience & demonstrated ability to independently process grievances & investigations; good written & oral communications skills reqd; permanent full time M-F 8-5pm; $11.96-18.20 hrly

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, Nov. 4, in room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Guest Room; prov liaison w/ community volunteers as needed; QUALIFICATIONS: working knowl of geography & foreign countries; an interest in inter'l edu & affairs; good telephone voice & manner—courtesy, accuracy; good typing skills plus knowl of business letter layout & usage; send appl/resume to Mary Clark, 2nd fl. 1 I-Center.; B09; $565-595.

31838-BP (JCC:2454) OFFICE ASST II: Asst to personnel offcr, processing PAF's, PDF's, PDF's, sick leave & vacation rprts; operates word processor/approx 2000 ltrs/yr to applicants; filing of confidential informa; distribute budget statments & bkup mat'l; relief receptionist for breaks; taking care of IBM 3 mos/yr; QUALIFICATIONS: typ 50; execise good judgment; willing to work w/ interruption; familiar w/ processing of payroll helpful; accurate typing skills & exp in answering business phones; send appl/resume to Liz Trujillo, 301 Encina Hall, Stanford, CA 94305.; B09; $1130-1189.

25870-BP (JCC:2462) OFFICE ASST III: Gift Processing Asst in Law Fund Offc; maintain accurate & detailed gift records for production of rprts to volunteers, & for internal use; maintenance of record keeping files; typing acknowledgments fr Dean of Law Sch'l; typing ltrs to volunteers; preparing lists, charts, etc; occasional evening & wkend work may be nec; QUALIFICATIONS: typ 60; familiarity w/ 9-key adding machine & other offc machines & equip't; exp w/ memory typewriter useful; 2 yrs related exp; good command of English grammar; good commu skills; strong typing skills; good interpersonal skills & organizational ability; send appl/resume to Liz Trujillo, 301 Encina Hall, Stanford, CA 94305.; B11; $1246-1310.

15119-BP (JCC:2462) OFFICE ASST III: Vehicle Register Clerk; 7:30-4:30; registers Med Ctr staff & Community Physicians vehicles to park on campus & at Med Ctr; respon for accountability of funds, sales record and processof various transactions; cashiering; posting daily receipts; deposits & submitting payroll deduction records to Med Ctr Payroll Office on 14th of each month; makes deposits & send copies to Dept of Public Safety on a daily basis; issues Clinical Faculty parking cards, temp parking stickers & spec permits as required; daily input on Data Point Terminal to post all permits sold; QUALIFICATIONS: typ 35-50; high sch'l grad or equiv; able to use calculator; basic arithmatical functions w/ speed & accuracy; supv temp employees 8/15 thru 10/31; may be moved to another location during this period of time; send appl/resume to Ramona Kelley, 711 Serra Street.; B11; $1246-1310.

42845-PM (JCC:2462) OFFICE ASST III: 50%, 12-4pm; sec'l coverage for Physicians Assistant Training Program; describe program to interested candidates; mail appl to interested applicants; set up & follow file to completion; organize applicant profile; arrange mtgs; heavy typing; respon to inquiries regarding program content; QUALIFICATIONS: typ 65+; excel typing skills, commu skills, organizational ability (Med exp helpful); send appl/resume to Winifred McCaffrey, 703 Welch F-1, Palo Alto.; B11; $623-655.

30973-PM (JCC:2554) SECRETARY II: Performs duties in Genl Reference Dept; advises in production of, types, photocopies & distributes rprts, schedules, charts, memo, bibliographies & ltrs; performs receptionist duties; miscellaneous clerical duties; maintain records for database search payments & maintains reference & informa desk statistics; maintains dept'l vacation & sick leave records & student payroll; maintain, orders & collects dept supplies; QUALIFICATIONS: prev sec'l exp; prev public serv exp; able to use transcribing equip't; ability to learn Wylbur or other text-editing sys; thorough knowl of English spelling, punctuation, & syntax; good commu skills, both orally & in writing; contact Bob Johnson, Green Lib, Rm 223, 497-3152.; B11; $1246-1310.

23589-BP (JCC:2562) SECRETARY III: Prov complete sec'l serv to 2 faculty & 2 or 3 research staff; prep manuscripts, res proposals & reports, using a computer text editor; initiate appt papers for faculty, res staff & students; prep stores & purchase reqs, interdept'l requests, check requests, expense reports; reconcile expenditure statements for sponsored res accts; prep projs of fund availability monthly; prep draft budgets for res proposals; answer phones; make travel arrangements, etc; QUALIFICATIONS: typ 65; min 3 yrs of sec'l exp; good verbal & written commu skills; good English usage & spelling; able to interface effectively w/ faculty, staff & students; familiarity w/ Univ forms highly desirable; computer text-editing exp or willingness to learn required; send appl/resume to M. Yearwood, Bldg. 460, Room 256.; B14; $1440-1514.

32115-PM (JCC:2596) SECY II-SPEC: Prov sec'l support to 3 Diagnostic Radiology faculty, & coord Div Clerkship; respon for phones & typing of corresp, manuscripts, grants; scheduling appts; travel arrangements, prep expense reports & other Univ forms; maintain faculty files as required, etc; QUALIFICATIONS: typ 65; 2-3 yrs sec'l exp; use of dictaphone & accurate typing; ability to interact w/ med students & med staff; contact: Sally Healey, S078 Med Ctr, 497-7863.; B12; $1310-1373.

30387-PM (JCC:5484) DATA AIDE II: Respon for maintaining control over epidemiological survey & surveillance records fr off-site ctrs; respon for records going thru manual validation procedures; respon of use of computer rprt to make corrections to data; prep of simple statistical tables; phone coverage; clerical support; QUALIFICATIONS: typ 40-50; knowl of large data bases essential; exp w/ data collection & mgmt; familiarity w/ computer processing procedures; exp on Stanford computer helpful (Wylbur, SPIRES, SAS); clerical exp required; send appl/resume to Kay Wilson, SHDPP, 730 Welch Road, Suite E, 497-7822.; B10; $1189-1246.

Carpools

Ride wanted from El Camino Real, next to Emporium in Mountain View—either one way or both. Will pay gas allowance. My hours are 8-5. Call Karen at 7-4847 or 969-3514 (home).

Looking for carpool, Fremont to Stanford, approx. 7 a.m. to 5:30 p.m. Call Steve at 7-9583 or 792-1486.

Established carpool, Oakland to Stanford, Hours 9-6. Non-smokers. George Gianopoulos, 7-6856.

Want to join a carpool from S.F. (22nd Ave. and Balboa area) to Stanford Medical Center 3-4 days a week, 8-5. Call Jackie Bertoletti, ext. 7-5955.

Carpool/rider, nonsmoker. SF to Stanford. 9-5, M-W, F. Call Paul Turner, 497-4275 or 497-3404, or David, 497-2727.

Looking for a ride or shared driving from Santa Cruz, 8-5. Gordon Muir, 497-3380.

Peter Coutts Hill condominiums

Stanford University is accepting applications now for rental of the new Peter Coutts Hill Condominiums.

Rental units will be available in December, 1982. Rental agreements, are month-to-month.

Preference in rentals will be given to members of the Stanford community (faculty, staff, students, etc.) and its affiliates. Families with children are welcome.

Floor plans of the various unit types and rental applications are available from the Peter Coutts Hills rental office, 138 Peter Coutts Circle, Stanford, Calif. 94305; (415) 493-1471.

The unfurnished average rents for the various types are as follows:

A-1	(2br/2ba)	$930
A-2	(2br/2ba/study)	$1,010
A-3	(2br/2ba/study)	$930 (handicapped unit)
B	(2br/2ba/study)	$985
C-1	(3br/3ba)	$1,095
C-2	(3br/3ba/study)	$1,200
D	(3br/3½ba/study)	$1,260

These are average monthly rents. The actual rent on any particular unit may vary slightly according to unit location. Additional rent of $50 per month will be charged for each unrelated adult in excess of one per unit.

Ph.D. oral exams

THURSDAY, OCTOBER 28

Uy-Loi Ly, aeronautics and astronautics, "A Design Algorithm for Robust Optimal Low-Order Controller Using a Finite-Time Performance Index," 4 p.m., Durand, Room 450.

WEDNESDAY, NOVEMBER 3

□ **Jan. to June, '83:** Visit. Prof. & wife from Oxford, no children, seek 2 or 3BR furn hse or apt on or nr campus. Call (415) 857-9263.

□ **Jan. '83 to Aug. '83:** Visit. Prof., wife & 2 children (11, 8) seek 2-3BR furn. hse or apt. nr good public schls. Easy commute to Stanf. WILL SWAP 3BR/2BA hse on 2 acres, 10 min. to U. Mass, Amherst, 1 hr. to Vermont ski slopes, 1½ hr. to Boston. Call COLLECT John Coliura, (413) 253-3287.

□ **Winter Qtr:** Visit. Prof. seeks furn. studio or 1BR apt within 3 mi. of campus. If poss. could hsesit. Call Elissa, 497-4977 (day).

HOUSING AVAILABLE

□ **Jan. '83 for 6-8 mos.:** Furn. campus hse. 2-3BR/2½BA. $950/mo. incl. grdnr & mo. hsecleaning. Call 857-9384 or 497-2065 (day).

□ **Beg. Jan. 1, '83:** College Terr. unfurn. family home, 4BR/2BA, carpets, drapes, AEK, fenced yd., 5 min. bike to campus, W/D nego. Refs. req, nonsmokers. $1250/mo. incl. grdnr. Call 858-0247.

□ **NOW:** Exceptionally lovely campus hse. Unfurn. 3BR/2½BA, study, all appl. Avail. for faculty or staff. $1100/mo. incl. garbage, water. Call Helen Meyer, 497-3453 (day).

□ **NOW:** Fully furn. 2BR/1BA 4-plex in Palo Alto. 4 mi. to campus. Incl. W/D, linens, dishes, carport w/storage. Children welcome. Walk to schls. Call Jane, 968-4957 or Jack, 494-2827.

□ **NOW:** Prof. bus. woman w/fully furn. apt. seeks permanent, mature, neat, clean hsemate to SHARE, who likes cat. Call 329-1225 (day) or (415) 364-3742 (eve).

□ **June 14, '83 to Aug. 29, '83:** Atherton, 5BR/3½BA fully furn. hse. Completely remodelled. Pool. $9000/10 wks. Incl. util., maid serv. twice wkly, gardener. Call (415) 321-4100.

□ **Beg. Nov. 1, '82:** Unfurn. hse, 4BR/2BA, newly redec., W/D. Nr. midtwn in P.A., nice family nghbrhd. 1 yr. lese. $1100/mo. Call (415) 329-0797.

□ **Beg. Nov. 1, '82:** Lge studio, furn. sep. entr. Dinette/ktchn, stor. wall, combo stove, frig, sink. Waterbed, carpet. 20 min. bike to campus. Share W/D & solar heat. Pool. $350/mo. + dep. Call (415) 364-5383, after 5 p.m.

□ **Now thru June, '83:** Sublet, Los Altos, 3BR/2BA, 2 frpl., lrg. priv. yd. $1000/mo. Call (415) 969-0613 (eves).

□ **Now:** Alpine Meadows, Tahoe. Nice cabin, 3BR/1½BA, W/D, phone, frpl, sleeps 10. $200/wknd, $70/wknight. Call 493-4139 (eve).

□ **Regularly available:** 1 & 2BR furn. & unfurn. apts. & twnhses in Palo Alto & Menlo Pk. in good nghbrhds, close to campus. Call Shirley, (415) 493-2321 or Jane, (415) 968-4957.

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

Emanuel Ax to give season's first master class on Nov. 6

Pianist Emanuel Ax, winner of the first Rubinstein International Piano Competition and the Avery Fisher Prize, has donated his master class fee to the Stanford Music Guild's Scholarshp Program.

"We are delighted that Ax has chosen to make such a generous contribution to the fund," said Sally Mentzer, coordinator of the Lively Arts community outreach program.

"Artist's fees for master classes and other activities are negotiated separately from the performance fee with the artist's agent. Usually the extra fees range between $500 to $750. Ax made his donation because of his interest in furthering the careers of other pianists."

Ax will give the first master class in Stanford's 1982-83 Master Class Program from 7 to 10 p.m. on Saturday, Nov. 6 in Kresge Auditorium.

A master class involves pre-auditioned students who play for a master artist-teacher, while an audience observes. Proceeds from the classes go to the Music Guild's scholarship fund.

The master class program was started in 1978 and is cosponsored by the Lively Arts community outreach program, Stanford Music Department and the Music Guild.

A committee made up of representatives from the Lively Arts, the Music Department, students, and the Music Guild selects the artists from the Lively Arts series who will give the master classes.

Current members of the committee include: Wolf Kuhn and Naomi Sparrow from the Music Department; Ginny Reyna, Alice Anne Roberts, Sandra Goodwin, Susan Hoebick and Sally Ellenberger from the Music Guild; and Mentzer and Nan Bentley from the Lively Arts. In addition, Cristina Ruotolo and Heather Bentley, music students, are also members of the committee.

"Once the Lively Arts season is announced, the master class committee meets to review the season and decide which performers would best balance the master class program," Mentzer said. "We also look at artists who have given master classes in the past and try to offer new opportunities to Bay Area music students.

"Some of our past classes have been given by: Janos Starker, cello; Elly Ameling, voice; Barry Tuckwell, French horn; Narcisco Yepes, guitar; and Garrick Ohlsson, piano.

"Occasionally an artist is selected from outside the Lively Arts season because they are already performing in the area.

"Auditions for the master classes are held before the class and are open to residents of the Greater Bay Area. Students are invited to apply and are then asked to audition before a panel of judges. Usually about 12 people audition for about four spaces. The students genrally range in age from 16 to adult, but the auditions are open to any age level," Mentzer said.

Other artists in the 1982-83 Master Class Program include: Michael Tree, violist with the Guarneri String Quartet, who will give a chamber music class from 7 to 10 p.m. Sunday, Nov. 14, in Kresge Auditorium. Auditions will be held from 1 to 5 p.m. Saturday, Oct. 30, in Dinkelspiel Auditorium.

Violinist Donald Weilerstein from the Cleveland Quartet will give a violin master class from 7 to 10 p.m. Tuesday, Feb. 15, in Dinkelspiel Auditorium. Auditions will be from 1 to 5 p.m. Saturday, Feb. 5, in Dinkelspiel Auditorium.

Guitarist Michael Lorimer will give the final master class from 7 to 10 p.m. Friday, Mar. 11, in Annenberg Auditorium. Auditions will be from 1 to 5 p.m. Feb. 26, in Dinkelspiel Rehearsal Hall.

To receive an application and for more information, contact Sally Mentzer, (415) 497-2551

Tickets to the Master Classes are available at the door or in advance at Tresidder Ticket Office, (415) 497-4317. General admission is $5; senior adults and non-Stanford students are $3; and Stanford students are free.—Joan Meister

Black Caucus holds election/reception

The Stanford Black Community Caucus (SBCC), a revitalized organization of faculty, students, and staff, whose main goals are to assure the continued existence, improvement, and advancement of the status of the campus Black community, will have its first annual election-community reception 4:30-7:30 p.m. Friday, Oct. 29, at the International Center. All interested are welcome to attend.

The SBCC membership attempts to work closely with university offices and officers that have a significant impact on the viability, personal or professional, of Stanford's Black community. Since its official reconstitution last fall, it has been addressing issues of concern—for instance, it has called for university-wide observance of Dr. Martin Luther King's birthday (Jan. 15).

The SBCC Staff Affairs Subcommittee has been working to develop a statement on Stanford's personnel policies from a black perspective and has discussed its findings with the University Task Force on Personnel Policies, as that group endeavors to develop its own statements.

The SBCC strives to be supportive and self-sufficient, doing as much as it can for the welfare of the community itself. Last December the SBCC hosted a holiday reception, attended by over 300, to welcome new members of the community. A community development-fundraising roller skating party was successful in raising funds that will assist the group in continuing its efforts.

There are plans this year for a community reception, a tribute for retiring Congresswoman Shirley Chisholm and other fundraising activities.

The SBCC has bi-monthly meetings, in which information about activities and opportunities for the community to take advantage of are shared. The organization's newsletter, *A New Day*, is published twice quarterly. Featured in previous issues have been: Dr. Harold Boyd, director of Medical Funds in the Development office; LaDoris Cordell, former assistant dean in the Law School, recently appointed to the Santa Clara County Municipal Court bench; and Barbara Howard, office assistant in Lagunita.

Rush Rehm (Yang Sun) and Johanna Dickely (Shen Teh) in *The Good Soul of Setzuan*

Brecht's *The Good Soul of Setzuan* has five performances in November

The first production in the Stanford Drama Department's 1982-83 season, Bertolt Brecht's *The Good Soul of Setzuan*, opens at 8 p.m. Tuesday, Nov. 9 with performances continuing through Saturday, Nov. 13 in Little Theater.

The production is directed by Geoffrey Reeves, who last year directed *The Recruiting Officer* and the highly acclaimed Nitery production of *King Lear*.

The cast features Johanna Dickey as Shen Teh/Shui Ta, Rush Rehm as Yang Sun, an unemployed pilot, Fritz Brun as the barber Shu Fu, and Frederick Benz as Wang, the water-seller.

The setting is designed by William S. Eddelman, who has used a texture fabric collage of bamboo, burlap, erosion netting and other natural materials to create the drab, colorless environment of a Chinese industrial city.

Douglas A. Russell's costumes reinforce the dull and dreary atmosphere, combining elements of the 1930 movies' view of Chinese dress with a Western reality. Chinese masks are used to indicate the facelessness of the masses. The lighting is designed by Heather McAvoy.

The Good Soul of Setzuan is a parable play, set in modern China. It is the story of three gods investigating the rumor that it is impossible to be good and survive in a world of poverty and hardship. They find a prostitute, Shen Teh, known locally as the "Angel of the Slums," to whom they give money for a night's lodging.

She buys a tobacco shop to enable her to lead a "life worthy of a human being." When her shop is soon over-run by an army of parasites and creditors, she invents a ruthless cousin, Shui Ta, to deal with the situation. Conditions force her to continue the use of the disguise for her self-preservation, with increasingly tragic results.

Brecht wrote *The Good Soul of Setzuan* in Scandinavia between 1938 and 1941. By the time it was first performed in Zurich in 1943, he had emigrated to the U.S. and was living in Santa Monica. To earn a living he sold scripts to the movies and tried to get a New York production of the play.

Brecht sent a revision of the script to Christopher Isherwood in the hope that he would agree to do a translation. Isherwood was not interested, but Kurt Weill was eager to make a semi-opera from the play. This, too, failed to result in a production.

The American premiere was finally done at Hamline University in St. Paul in March of 1948, some five months after Brecht had returned to Berlin. The script was a shortened version of the Zurich script translated by Eric Bentley. In the Stanford production, director Reeves has used the Santa Monica version as a model, adopting many of the cuts and changes in that revision.

The Good Soul of Setzuan is presented instead of the originally scheduled *Turandot*. Tickets are available at Tresidder Ticket Office and by telephone (497-4317) with major credit cards. General admission is $4; students and seniors are $2.

High mass to celebrate Feast of All Saints

The Feast of All Saints will be celebrated by a High Mass in Latin at 8 p.m. Monday, Nov. 1, at the Stanford Memorial Church.

The *Missa Carminum* by the Renaissance composer Heinrich Isaac (ca. 1450-1517) will be sung by the choir of St. Ann Chapel under the direction of Prof. William Mahrt of the Music Department.

The Mass will be celebrated according to current Roman Catholic norms by Rev. Benignus Barat, O.S.B., of the Woodside Priory.

Half-price offer

Faculty and staff basketball season ticket applications have been sent out. Don't miss out on this special half-price offer which includes not only all Pac-10 and tournament games, but also free admission to seven nonconference games.

Return your applications now for the best available seats or stop by the athletic department to place your order.

Empire Brass Quintet to play Ewald, Albinoni, Schumann

The internationally acclaimed Empire Brass Quintet will be presented by the Lively Arts at Stanford at 8 p.m. Wednesday, Nov. 3, in Dinkelspiel Auditorium.

The program will feature Albinoni's "Suite en Sol," Victor Ewald's "Symphony for Brass" (which they have recorded), and Alvin Etler's "Quintet." In addition, the group will play selections to be announced, including works by Robert Schumann, George Gershwin, and Johann Sebastian Bach.

This ensemble has performed extensively in the U.S. and Europe. They have played for Queen Elizabeth II in Boston, and as part of former President Carter's Inauguration. In March, 1982, the Quintet traveled to Japan for their first tour of that country, where they were met with critical praise.

The current Quintet-in-Residence at Boston University, they have recorded nine albums.

Since its founding, the Quintet has been in the vanguard of performing new music, and has commissioned works from such leading composers as Leonard Bernstein, Peter Maxwell Davies, Brian Fennelly, and Gunther Schuller.

The members of the Empire Brass Quintet were introduced to one another by Leonard Bernstein at Tanglewood in 1971. All five are well known in their own right.

Rolf Smedvig, founding member, has served as principal trumpet of the Boston Symphony, and as a member of the Boston Pops and Boston Symphony Chamber Players. As music director of the Cambridge Chamber Orchestra, he has recorded two albums in which he is featured as conductor and soloist. Smedvig is currently on the faculties of Boston University and the Berkshire Music Center.

Trumpeter Charles A. Lewis, Jr., is on the faculty of both the New England Conservatory and Boston University. A recipient of the C. D. Jackson prize, he has appeared as a soloist with the Concert Orchestra, National Philharmonic Orchestra, and in the American premiere of Boris Blacher's *Concerto for High Trumpet and String Orchestra*.

David Ohanian, French horn, was a member of the Boston Symphony and Boston Pops Orchestras from 1970-1981. He has performed with such diverse musical groups as the American National Opera Company with Sarah Caldwell, the Newport Jazz Festival with Barbra Streisand and Henry Mancini. A founding member of the Empire Brass Quintet, he is currently on the faculty of Boston University and director of the Empire Brass Quintet Symposium at the Boston University Tanglewood Institute.

Trombonist Lawrence Isaacson formerly was principal trombone with the San Francisco Symphony. Earlier, he was principal trombone with the Hamilton Ontario Philharmonic from 1978-81. During that time, he also served as trombonist for the Royal Brass Quintet, the Canadian Broadcasting Company (Palace TV series), and the Grant Park Symphony in Chicago. Isaacson has also played with the Chicago Symphony Orchestra.

Samuel Pilafian, tuba, is an original member of the Quintet. As a free-lance musician, he has performed with the Boston Symphony, Boston Pops, Metropolitan Opera, New York Philharmonic, Duke Ellington Orchestra, and Pink Floyd. He has recorded for every major recording company and television network in the U.S. In recent years, he has been principal tuba of the American Ballet Theater Orchestra, and he is currently on the faculty of Boston University and the Empire Brass Quintet Symposium of the Boston University Tanglewood Institute.

For ticket information, call Tresidder Ticket Office, (415) 497-4317.

Mexican novelist Juan Rulfo speaks on campus Nov. 4

Juan Rulfo, considered Mexico's most important writer today, will speak at 7:30 p.m. Thursday, Nov. 4, in Room 2, History Corner, Stanford University.

Known to Mexican movie-goers for his many film scripts, Rulfo is renowned in literary circles for *El llano en llamas* (The Valley in Flames), a collection of short stories, and *Pedro Páramo*, a novel about a powerful landowner who dominates his town like a feudal lord. His work has been compared to that of American author William Faulkner.

"Rulfo has produced a type of narrative without parallel in contemporary literature," says Stanford Prof. Fernando Alegria, himself a writer and poet.

"Basically, Rulfo works with language that seems primitive, the language of peasants and obscure provincial types. Out of these strange and powerful monologues, or isolated pieces of dialogue, emerge tragic characters of great force and depth which speak a message of universal significance."

Rulfo was born in Jalisco, Mexico, in 1918. His family was victimized during the Cristeros War (militant Catholics against the government, 1926-28), and he ended up in an orphanage in Guadalajara.

Rulfo later moved to Mexico City and attended the National University, but never became a regular student. His first work of fiction was published in 1953. He has been honored by international writers' groups and recently was Regents' Lecturer at Barnard College in New York.

The evening with Rulfo is sponsored by the Department of Spanish and Portuguese and the Center for Latin American Studies.

Tyrannicide topic of Nov. 2 lecture

Prof. Franklin Ford from Harvard University will offer a free public lecture on "Tyrannicide and the 20th Century: Variations on a Classical Theme" at 4:15 p.m. Tuesday, Nov. 2, in History Corner, Room 205 at Stanford.

Ford has been the McLean Professor of Ancient and Modern History at Harvard since 1968, and has authored several books on modern Europe. His most recent publications and research are on the history of political assassination.

The lecture is free, and the public is invited.

Amish and Cajuns featured in films

Two films on unique cultures within the U.S. will be featured at tomorrow night's (Thursday, October 28) program of the International Center's Other Cultures film series, beginning at 7:30 p.m. at the I-Center.

"Amish: A People of Preservation" is an award-winning film which examines the religious beliefs, sense of community, and closeness to nature of the Amish people of Lancaster County, Pennsylvania.

"Spend it All" is a beautifully photographed, deeply revealing document of the culture of the Cajun people of southwest Louisiana, capturing the intense bravado and vitality of their lives as well as the energy of their folk music.

The Other Cultures film series is an ongoing I-Center activity, now in its fifth year of weekly presentations, showing informative and entertaining films about people from all parts of the globe. Admission is free, but a 75 cent donation to help defray costs is requested at the door.

The Newport Jazz Festival All-Stars

On Saturday—Hear the Newport Jazz Festival All-Stars!

The legendary Newport Jazz Festival All-Stars will be presented by the Lively Arts at Stanford at 8 p.m., Saturday. Oct. 30 in Memorial Auditorium.

The sextet's program, "The Golden Age of Popular Jazz," will feature a broad cross section of works by America's greatest jazz and popular song composers, including Louis Armstrong, Duke Ellington, Count Basie, Cole Porter, George Gershwin, and Harold Arlen.

The name Newport has been synonymous with the best that jazz has to offer for almost 30 years. An integral part of the festival's story has always been the Newport Jazz Festival All-Stars. Over the years, groups bearing the All-Stars title have been peopled by a diverse array of outstanding artists.

The All-Stars perform in concert halls from Tokyo to Rome spreading America's indigenous art form. The special, swinging "joie de groove" that characterizes every All-Star get-together is the essential secret of the group's international popularity.

The Newport Festival was originally held in Newport, Rhode Island, in 1955. The festival moved to New York City in 1972, but returned to its "roots" in the summer of 1981.

This edition of the Newport All-Stars is directed by cornetist Ruby Braff, who brings a wealth of experience to the bandstand, having played with such names as Tony Bennett, Benny Goodman, Louis Armstrong and Count Basie.

George Wein, pianist and producer of the Festival All-Stars, has dedicated his life to presenting quality jazz events all over the world. The regular pianist of the All-Stars, Wein also produces the Kool Jazz Festival in New York and major cities throughout the world.

Along with Wein is Slam Stewart on bass. Stewart, whose pioneering trademark has always been humming in a higher octave while he bows his instrument, has played with piano giants Arts Tatum and Errol Garner, among others.

Tenor saxophonist Scott Hamilton, a regular guest at many of the world's jazz festivals, plays in the big style of reedmen Paul Gonsalves, Ben Webster, and Coleman Hawkins. Hamilton has been dubbed the front man of the young swing generation.

On the trombone is Eddie Hubble. He is a versatile musician who has played in a host of notable groups including the Duke of Dixieland and the World's Greatest Jazz Band.

Drummer Oliver Jackson's time-right rhythm has been coupled with a long list of jazz greats including Oscar Peterson, Earl Hines, and Teddy Wilson. Jackson is a featured drummer at festivals the world over.

For ticket information, call Tresidder Ticket Office,(415) 497-4317.

Pete McCloskey to speak at I-Center

The Honorable Paul N. ("Pete") McCloskey, U.S. representative from the 12th Congressional District in California, will discuss "Middle Eastern Crises Negotiation" at the weekly Tuesday luncheon/lecture series beginning at noon, Nov. 2 at the Bechtel International Center.

McCloskey will report on his participation in a recent congressional fact-finding mission to the Middle East, during which he and his colleagues met with leaders from all countries involved in the war in Lebanon.

The Tuesday series, now in its seventh year, is focusing this fall on the backgrounds of major world issues which impede peaceful resolution of political and social conflict.

The talk includes luncheon, limited to 40. Tickets are on sale now for $2.50 at the International Center. Brown-baggers are also welcome at no charge. For more information, phone the I-Center at 497-1831.

'American Pictures'—a Dane's view of social underworld

"American Pictures," a haunting multi-media presentation of America's social underworld, will be shown free of charge Thursday, Oct. 28, in Kresge Auditorium at Stanford.

Part one of the film will begin at 6:30 p.m., part two at 8:45 p.m.

Cosponsored by the Afro-American Studies Program, the Stanford Workshop on Political and Social Issues (SWOPSI) and the Stanford Progressive Alliance (SPA), the movie chronicles Danish vagabond Jacob Holdt's five-year journey through the American underclass.

The movie traverses every layer of American society—from black sharecroppers in the deep south to the Rockefeller dynasty. In doing so, Holdt demonstrates, as film critic Richard Martin says, that "each of us, white or black, leftist or rightist, poor or rich, are limited by specific class ideologies, and subject to narrow mindedness."

"American Pictures" is a strong leftist political statement. Holdt says, "I did it because I felt outrage about the neglect of minorities in America."

Nevertheless, Holdt exposes a pathos in America which cuts across class and racial lines. He shows how the black ghetto family internalizes self-hatred in a frustrated desire to achieve society's myths, individual success and the nuclear family. At the same time he shows how the white majority is as often the victimized as the victimizer, turning to alcoholism and escapism despite possessing all the outward signs of success.

Holdt, 35, was raised in a small village in rural Denmark. Hitchhiking his way around the United States at age 22, he sold his blood twice a week to buy film for his camera.

That he came from a welfare-state society with virtually no poverty, adds to the realism with which American poverty amid plenty is portrayed. Individual photos are often brutally graphic.

"People in this country are so used to seeing artificial violence on TV that they can't confront real violence," says Holdt.

He has donated all profits to the American Pictures Foundation, a non-profit organization created in 1978 because of the film's unexpected financial success. The Foundation helped fund construction of a school in Northern Zimbabwe and is currently buying equipment for a cooperative farm with the Danish government.

Holdt and two assistants will conduct a seminar on racism, from 1 to 3 p.m. Oct. 29, in the Forum Room of Meyer Library. He will be available for interviews about his work both before and after the showing.

Nicaragua topic of I-Center talk

Barbara Ulmer, codirector of Our Developing World will present "Nicaragua Behind the Headlines: An Eyewitness Report," illustrated with slides, on Wednesday, Nov. 3, at 4:15 p.m. in the Bechtel International Center.

Ulmer and her husband Vic have led educational trips to many developing nations in conjunction with programs they have presented on China, Sub-Sahara Africa and Central America. During the summer of 1982 they conducted a group through Nicaragua and met with political and church leaders as well as other people involved in many aspects of development in that country since the fall of Somoza.

The Ulmers are teachers at the Fremont High School District and have led study tours through Cabrillo College to Tanzania, Cuba, and China as well as Nicaragua.

The meeting is open to the public without charge. For more information, call 497-1831.

Recreation update

Encina weight room has added weekend hours so that it now opens at 12 noon seven days a week. Hours are: M-Th noon-2 p.m., 3:30-8:30 p.m.; Fri. noon-8:30 p.m.; SS noon-5 p.m. (except on football Saturdays, when it is closed all day).

Roble Gym hours have changed quite a bit; hours are posted on the front door of the gym.

Roble Pool will be open on the football Saturdays that deGuerre Pools are closed: 1-5 p.m. Oct. 30 and Nov. 6.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Oct. 27 to cover the week of Mon., Nov. 8 through Sun., Nov. 14.

LATE ANNOUNCEMENTS

Thurs., Oct. 28. Stanford Geothermal Program Seminar: "Low-Temperature Geothermometry" with George A. Parks, Applied Earth Sciences Dept. 1:15-2:30 p.m. Room B67, Mitchell Bldg.

Roble Political Action Committee Presentation: By Bill Royer, candidate for the 11th Congressional seat. 6:30 p.m. Roble Hall lounge. Open to all.

Fri., Oct. 29. Stanford Black Community Caucus: Reception and election of officers. 4:30-7:30 p.m. Bechtel International Center.

MONDAY, NOVEMBER 1

CROW Women at the Top Lecture Series: Ruth Bader Ginsburg, Judge, U.S. Court of Appeals, District of Columbia Circuit, will speak. Noon. Terman Aud. Open to all.

Biological Sciences Dept. Seminar: "The Nature of Baculoviruses and Their Use for Insect Pest Control" with Dr. Lois Miller, Univ. of Idaho. 4 p.m. Herrin Lab. Room T-175. Open to the public.

Numerical Analysis Seminar: "Compact as Possible Difference Schemes for Second Order Two Point Boundary Value Problems on Nonuniform Meshes" with Andrew White, Los Alamos National Laboratory. 4:15 p.m. Math 380C.

Radioscience Seminars: "Is Titan Wet or Dry?" with Von Eshelman, S.U. 4:15 p.m. McCullough Bldg., Room 127.

Materials Science and Engineering Dept. Special Seminar: "Overview of Amorphous Semiconductors" with Prof. Dr. Josef Stuke, Univ. of Marburg, West Germany. 4:15 p.m. Peterson 550A.

Stanford Film Society: "Touch of Evil." 7 p.m. Kresge Aud. $1.50.

Memorial Church Service: High Mass in Latin for All Saints Day. The *Missa Carminum* and Gregorian chants for the day sung by the choir of St. Ann Chapel. 8 p.m. Memorial Church. Open to all.

TUESDAY, NOVEMBER 2

I-Center Tuesday Lecture/Lunch Series: "Middle Eastern Crises Negotiation" by the Hon. Paul N. McCloskey, recently returned from a fact finding mission in the M.E. Noon. I-Center. Lunch tickets for $2.50 available a week in advance. Brown baggers welcome.

Stanford Museum Art Tours: "Approaches to Painting." A lunch hour tour beginning at 12:15 p.m. Stanford Museum. Open to all. (Tour repeated tomorrow, same details.)

Professional Opportunity Program for Ph.D.'s: "Successful Academic Interviewing Skills." 3:15-5 p.m. CERAS, Room 204.

Communications Design Seminars: "Satellite Systems and Communications Services" with Dan Miller of Hughes Aircraft. 4:15 p.m. McCullough Bldg., Room 128.

History Dept. Lecture: "Tyrannicide and the 20th Century: Variations on a Classical Theme" by Prof. Franklin Ford, prof. of ancient and modern history, Harvard Univ. 4:15 p.m. History Corner, Bldg. 200, Room 205. Public cordially invited.

Fluid Mechanics Seminar: "Boundary Layer Stability—Recent Developments" with Helen Reed, S.U. 4:15 p.m. Skilling Aud.

Applied Physics Colloquium: "The Surface Science of Heterogeneous Catalysis and Its Application to the Photo-Chemical Disassociation of Water" with Prof. Gabor Somorjai, UC-Berkeley. 4:15 p.m. Applied Physics 200.

Computer Science Colloquium: "Meta-Level Programming" with Prof. Michael Genesereth, S.U. 4:15 p.m. Jordan 040.

Roble Political Action Committee Reception: To watch election results. Professors and others have been invited to comment. 5 p.m. onward. Roble Lounge. Open to all.

WEDNESDAY, NOVEMBER 3

Book Sale: Books and periodicals in many fields. Hardbound $1 and up, paperback 25 cents and up, periodicals 10 cents. 11 a.m.-1:30 p.m. Green Library, West Wing, 1st floor, Room 101.

Ecumenical Ministries Wednesday Lunch Discussion Series: "Social Conflict in the American Political Economy" by John Manley. Noon. Casa Zapata (Stern Hall) dining room. Bring a bag lunch or arrange to eat at Zapata.

Physics Dept. Colloquium: "Micro-Miniature Refrigeration—Small is Better" with Prof. William Little, S.U. 4:15 p.m. Physics Lecture Hall, Room 101.

Electronics in Medicine Seminar: "Medical Nuclear Magnetic Resonance Imaging" with Dr. Joel Blank, Diasonics, Inc. 4:15 p.m. McCullough 134.

EE 380 Computer Systems Laboratory Seminar: Topic TBA. The speaker is John W. Hill, Microbot, Inc., Mt. View. 4:15 p.m. Terman Aud.

Colloquium of the Dept. of Chemical Engineering: "On the Flow of a Dilute Solution of a Long-Chain Polymer Near a Wall" with Prof. Nhan Phan-Thien, Univ. of Sydney, Australia. 4:15 p.m. Chemical Engineering Conference Room.

I-Center Slide/Talk: "Nicaragua Behind the Headlines: An Eye-Witness Report" by Barbara Ulmer, co-director, "Our Developing World." 4:15 p.m. I-Center. Public cordially invited.

Stanford Hillel Chorus: Under the direction of Dan Melamed singing Israeli, Hebrew and English music. Every Wednesday night. 7-9:30 p.m. Memorial Church Rehearsal Hall. Everyone welcome to participate. Information at Hillel, 497-1602.

Stanford Hillel Lecture: "Israel in Lebanon: What Was Media's Role?" by Hirsh Goodman, military correspondent and strategic analyst for the *Jerusalem Post*. 8 p.m. Kresge Aud. Public corddially invited.

The Lively Arts at Stanford: Empire Brass Quintet. Rolf Smedvig, trumpet; Charles A. Lewis, Jr., trumpet; David Ohanian, French horn; Lawrence Isaacson, trombone; Samuel Pilafian, tuba. Works by Albinoni, Ewald, Etler, and selections to be announced from works by Schumann, George Gershwin, and J. S. Bach. 8 p.m. Dinkelspiel Aud. $9.50, $8.50; students $3 off these prices.

School of Education Lecture: "Model Muddling in Science: The Case of Jean Tiaget" by Dr. Sophie Haroutunian, St. Xavier's College, Chicago. Noon-1 p.m. CERAS Bldg., Room 204.

THURSDAY, NOVEMBER 4

Stanford Geothermal Program Seminar: "Radon Transport in Two-Phase Reservoirs" with Lewis Semprini, Civil Engineering Dept. 1:15-2:30 p.m. Room B67, Mitchell Bldg.

Biological Sciences Dept. Special Seminar: "Control of Cell Differentiation and Pattern Formation in *Dictyostelium discoideum*" with Dr. Christopher Town, Case Western Reserve, Cleveland, Ohio. 4 p.m. Herrin Lab, Room T-175. Open to the public.

Solid Mechanics Seminar: "Acoustic-Elastic Effect in Textured Materials" with Prof. George Johnson, UC-Berkeley. 4:15 p.m. Skilling Aud.

Condensed Matter Physics Seminar: "Theory of Silicon Surface Reconstruction" with K. Pandey, IBM, Yorktown Heights. 4:15 p.m. Applied Physics 200.

Japan Society/Committee for Art Film Series: "Kurosawa," a talk by Audie Bock, film scholar and translator of Kurosawa's autobiography at 7 p.m., followed by the film, "Kuomonosujo" (Throne of Blood), Akira Kurosawa's rendition of *Macbeth* at 8 p.m. Reception follows. Annenberg Aud. $4 general, $3 students.

I-Center Other Cultures Film Series: "Hildegard Neff's Berlin"—the actress/author is the guide to the divided but freewheeling city; and "Jonathan Miller's London" with the physician and TV/theater personality as guide. 7:30 p.m. I-Center. 75 cent donation at the door.

STARTS Open Mike: 9 p.m. Coffee House. Sign up at STARTS office.

FRIDAY, NOVEMBER 5

Applied Mathematics Lectures: Modern problems in dislocation theory" by Prof. David M. Barnett, S.U. 3:15 p.m. Room 380-C (Mathematics Corner Basement).

Materials Science and Engineering Dept. Colloquium: "Materials for Coal Gasification Combined Cycle Power Plants" with Mr. W. T. Bakker, EPRI. 3:30 p.m. Peterson Laboratory, Room 550A.

The Lively Arts at Stanford Workshop: Conducted by Anner Bylsma, violoncello, who will coach students of Tom Stauffeur and Irene Sharp. 3:30 p.m. Dinkelspiel Aud. Free and open to the public as observers.

The Lively Arts at Stanford: Anner Bylsma, violoncello. Performs three of J. S. Bach's Six Suites for Unaccompanied Violoncello. Suite No. 2, in D minor, BWV 1008; Suite No. 3, in C Major, BWV 1009; Suite No. 6, in D Major, BWV 1012. 8 p.m. Dinkelspiel Aud. $9.50, $8.50; students $3 off these prices.

Hillel Liberal Shabbat Service: 7 p.m. Old Union Clubhouse. Dinner follows, Kosher/Milchig. Cost of dinner and other details available at 497-1602.

STARTS Great Directors Film Series: "L'Amour Fou (Foolish Love)" 1968, dir. by Jacques Rivette. The story of a couple breaking up, maritally and mentally. 8 p.m. Geology Corner, Room 320. $3.75 general, $2.75 students.

STARTS Live Entertainment: Night Music. Jazz. 9 p.m. Coffee House. Free.

SATURDAY, NOVEMBER 6

Varsity Football: Vs. Arizona. 1 p.m. Stanford Stadium. Ticket information at 497-1021.

The Lively Arts at Stanford Master Class: By Emanuel Ax, pianist. Winners from the Oct. 23 audition perform and Mr. Ax comments. 7-10 p.m. Kresge Aud. $5 general; seniors and non-Stanford students $3; Stanford students free. Proceeds to the Music Guild scholarship fund.

STARTS Live Entertainment: Nuclear Whales. Rock. 9 p.m. Coffee House. Free.

SUNDAY, NOVEMBER 7

University Public Worship: Student Worship Service, 8:30 a.m.; Robert G. Hamerton-Kelly, dean of the chapel, sermon and eucharist, 11 a.m.; Catholic Mass, 4:30 p.m.

African & Afro-American Studies Lecture: "Autobiography, Biography: The Worlds of Langston Hughes" by Prof. Arnold Rampersad, English Dept. 4 p.m. Ujamaa Lounge of Lagunita Court. Reception follows. Open to all.

ASSU Sunday Flicks: "Taps." 7 & 9:30 p.m. Memorial Aud. $1.50.

The Lively Arts at Stanford: Emanuel Ax, piano. Haydn—Sonata in C Major, Hob. XVI/48; Schoenberg—6 Little Pieces, Op. 19; Beethoven—Variations & Fugue in E-flat Major, Op. 35 ("Eroica"); Chopin—Ballade in F minor, Op. 52, 3 Mazurkas, Andante Spianato & Grande Polonaise, Op. 22. 2:30 p.m. Memorial Aud. $11.50, $10.50, $9.50, $8.50; students $3 off these prices.

EXHIBITS

Paul Harris—Still Life. Stanford Museum. Through January 2.

Venice in the 18th Century. Paintings, drawings, prints and decorative arts. Stanford Art Gallery. Through December 19.

The Map as Landscape. Familiar and new aspects of Western landscapes by Donna Van Dijk. Bechtel International Center. Month of October.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through November.

Wood Construction and Process Sculpture by E. David Camardo. For library environment. The Jonsson Library of Government Documents, Green Library. Through December.

Thirty Miles from Stanford. Photographs by Paul Berger. Tresidder 2nd floor gallery. Month of October.

Paintings on Canvas by David Cusic. Coffee House Gallery. Month of October.

Photographs by Marianne Skogh. Gold Lounge, both entries, and other locations. Stanford Faculty Club.

Maps Are For Use. An assortment of maps and related cartographic reference works available from the Central Map Collection. Meyer Library Lobby. Through November 19.

New clock tower construction starts

Construction of the new clock tower will begin soon at the intersection of Lasuen and Escondido Malls, between the Career Planning and Placement Center and Cubberley Education Building.

The fence is already up at the site and project manager Shirley Chen estimates it will take up to five months to complete construction.

The 45-foot tower will contain the original clock works and four of the five original chimes that started their campus career in the Memorial Church tower destroyed in the 1906 earthquake. The clock works have been returned to first-class working order by Emeritus Prof. Henry Fuchs and volunteer aides.

Funds for the installation, which will include trellises and benches, were provided by an anonymous donor.

CAMPUS REPORT

Volume XV, Number 8 | A publication for Stanford University faculty & staff | November 3, 1982

University defends patent on gene splicing, cloning

Stanford University has responded to issues contained in an Aug. 2 "office action" by the U.S. Patent Office which had rejected a genetic engineering patent application.

The patent application covers the products of basic gene splicing and cloning methods invented by Stanley N. Cohen, professor of genetics at Stanford, and Herbert W. Boyer, professor of biochemistry at the University of California at San Francisco.

Niels Reimers, director of Stanford's office of technology licensing, said the response addresses all objections raised by the Patent Office "and we anticipate it will result in issuing of the patent in the near future."

Reimers said the Patent Office confirmed receipt of the document on Monday (Nov. 1). The university had three months from the Patent Office's August action to respond.

Reimers said he could not predict when a response would be available from the Patent Office.

The university's response included a 22-page amendment and remarks to the original patent application, as well as declarations by several scientists, including Cohen, Boyer and Bernard Weisblum, professor of pharmacology at the University of Wisconsin Medical School, who said information contained in the application was "enabling"—accurate and detailed enough to permit other researchers to use the genetic engineering techniques described.

The attorney noted that issue had been considered crucial, since the patent application includes an incorrect interpretation about how a particular plasmid (a circular form of DNA) was formed during Cohen's and Boyer's original experiments.

However, Weisblum and the university

Indirect cost recovery now 'most volatile' income source

Changes in research volume and indirect cost recovery have become the "most volatile" part of Stanford's income, President Donald Kennedy told the Stanford Faculty Senate Thursday, Oct. 28.

Slower than expected research growth could result in a $3 million shortfall of income in the University's current operating budget of $207 million, Provost Albert Hastorf warned deans and other officers Oct. 20.

The changed outlook could generate "deep and significant controversy," both in Washington and on campus, Kennedy told the Senate.

While National Institutes of Health proposals to cut indirect cost reimbursements 10 percent have been "temporarily resolved," there are still "serious Congressional questions about indirect costs," Kennedy said. He indicated leaders of several universities would be discussing their concerns with representatives and federal officials in the capital.

"It is a very serious problem, both in terms of its leverage on our budget and in terms of political difficulties," he added.

"We're very determined to get it discussed thoroughly. . . . I want to urge faculty members, particularly those who do sponsored research, to make a real effort to understand the full range of complexities attached to this problem, and that really takes a a lot of work."

Last March, Stanford projections assumed research volume would grow about eight percent annually, compared to 11 percent a year earlier. Roth figures were tied to expected inflation.

When the 1981-82 results were examined, "we saw the beginnings of what appears to be a flattening in the total

Planning Commission reviews Stanford West

The third round in Stanford's effort to build more housing for its faculty and staff along Willow Road in Palo Alto will take place Wednesday night, Nov. 3, before that city's Planning Commission.

The occasion will be the second hearing on the two-inch thick Environmental Impact Report (EIR) for the proposed Stanford West housing project. It follows a review of the design of the project by the Architectural Review Board Oct. 28.

Stanford West is a complex of 1,275 units on 46 acres between the Oak Creek Apartments and the Children's Health Council, and 194 units on 4.3 acres of land at the corner of Willow Road and Pasteur Drive.

Scheduled to be both for-sale and rental housing, the units will be made available to all faculty and staff. If the proposal passes, construction of the first units would begin next spring.

Stanford West, the 140-unit Peter Coutts Hill project, and the 800-bed Governor's Corner student housing project all are in response to the acute shortage of housing for faculty, students, and staff in this area.

At the first hearing of the Stanford West EIR on Oct. 13, speakers questioned the size of the project and the traffic that would result from it. Members of the Planning Commission inquired about the impact on the city's recreational space and programs, the affordability of the units, and the project's "conceptual goals."

"There are several points to bear in mind about Stanford West," states Phil Williams, Stanford director of planning.

"First, the City's policies and practices have encouraged—even required—Stanford to build housing on the Willow Road site. That was a condition of the city's agreement to support a Willow Road improvement project in 1978, and the zoning of the property has been reaffirmed through two City Comprehensive Plan reviews."

"Second, the project is well within the allowable number of units under city zoning: the regulations allow 1,600 units on the 46-acre site, and we are proposing 1,275.

Wallace Stegner

Ansel Adams

Adams, Stegner, hold rap session

Photographer Ansel Adams and author Wallace Stegner autographed their work at a reception Sunday, Oct. 24, following what was billed as "a relaxed dialogue" between the two old friends in Memorial Auditorium.

Sponsored by the Library Associates and the Committee for Art and introduced by Library Associates chairman Frank Novak, Adams and Stegner talked a little about photography and reaffirmed their dedication to the natural environment.

Asked by Stegner why he no longer made prints from his famous negatives, Adams replied, "To leave my hands free for new work. My schedule was dedicated entirely to darkroom work."

Noting that Adams had compared a negative with a musical score and the print with a performance, Stegner continued, "You have been regarded as a romantic because of your reverence for nature, but your prints are austere and sharp, not vague and romantic. You remind me more of Bach than Schubert."

Adams was delighted. "I'd rather be Bach than Schubert," he said.

Acknowledging themselves to be artists and environmental propagandists, they repeated their concern about the current administration in Washington, D.C.

"The President and James Watt are dangerous to the lives of our descendants," said Adams.

"There is an enormously powerful organization on the side of exploitation," said Stegner, "resisted by a small bunch of Afghans in the hills. The members of all the environmental groups number only a few million."

"People must not emulate the ostrich and stick their heads in the sand," urged Adams.

"People should let themselves be awed by nature," added Stegner, "and take personal responsibility for preserving it."

The Ansel Adams Fund has been newly established at the Stanford University Libraries for the acquisition, care, and enhancement of library resources relative to photography and the environment.

The inspiration for the fund came from Library Associates board member George Waters, a Stanford alumnus and long-time friend of Adams. Waters has supervised the printing of many of Adams's books at Pacific Lithograph Co. and has donated related materials to the new collection, some of which are now being exhibited in the Green Library Lurie Rotunda.

Fariello to direct United Way drive this year; it's time to share

Stanford's annual appeal for the United Way will begin on November 15, under the direction of Lois Fariello, manager of conferences on the campus.

That may not be especially exciting news, but it is important all the same. There are 81 human care agencies depending on the United Way for the coming year and thousands of people depending on them.

The people who work in the Stanford community, and the emeriti and retirees who remain a part of it, have a long record of thoughtful giving to the United Way and its predecessors. Last year we gave $87,532 to support the United Way's good work. (We also gave $39,234 to support the Combined Health Agencies Drive in a separate campus appeal last spring.)

This year the United Way's dependents are in particularly serious need, for reasons that are obvious. The warm economic sun in which most of Silicon Valley is basking does not reach into many of the low-income and no-income corners of Santa Clara and San Mateo counties, or across the Bay.

There are men and women out of work, elderly who need help and children who need to be cared for. Those of us who can help should, and this is just about all of us who see *Campus Report*.

The economy makes it even harder on the needy

Margo Smith fills Law School post

Margo D. Smith, 40, trial lawyer with the U.S. Attorney's Office in San Jose, has been named assistant dean for student affairs at Stanford Law School, effective Dec. 1.

Her selection was announced by Dean John Hart Ely.

Smith, who graduated from the School in 1975, "will be able to deal effectively with all our students and student organizations," Ely noted.

"We are particularly pleased about the contribution she will make to our continuing effort to attract qualified minority students to Stanford. The Law School has a total enrollment of 507 students, of whom 95 are minorities. About one third are women.

Smith succeeds LaDoris H. Cordell, who left Stanford last spring to become a judge in the Santa Clara County Municipal Court.

Formerly Margo Dianne Richmond, Mrs. Smith was born and raised in Rossford, a small town near Toledo, Ohio.

She attended San Jose State University, earning a B.S. in microbiology and premedical studies, and worked as a medical technologist for three years before entering law school.

"Deep inside I always wanted to be a lawyer," she said in a telephone interview.

"My mother recently found my grade school diary, where I had written of my dream of being a trial attorney. But it was awhile before I realized that it was okay for me to become one."

After graduating from Stanford Law School in 1975, Smith passed the California Bar exam and became a deputy district attorney with the Santa Clara County District Attorney's Office in San Jose. She has been with the U.S. District Attorney's Office since 1979.

As an assistant U.S. attorney, she prepares and presents cases to grand juries and for trials involving violations of federal criminal laws. She also supervises beginning lawyers working as law clerks.

"My primary focus at Stanford will be to guide and counsel students and to attract students to the School," she said.

"Stanford offers minority students the same advantages it offers all students—absolutely top-notch legal training and prestige," she observed.

Smith is married to Ezekiel L. Smith, manager of telecommunications at Stanford. He graduated from Stanford Business School with an M.B.A. in 1972.

Smith's appointment gives the Law School its full complement of administrative deans, Ely pointed out.

Already in place are Thomas F. McBride, associate dean for administration, who arrived October 25, and two incumbents: J. Keith Mann, associate dean for academic affairs; and Victoria S. Diaz, assistant dean for development and alumni/ae relations.

"In Keith, Tom, Vicky, and Margo, we will have a set of deans of truly remarkable strength," Ely said.

Associate Prof. Robert Sinclair and research assistant **Tsutomu Yamashita** of the Stanford Department of Materials Science and Engineering have been named recipients of the 1982 Marcus A. Grossmann young author award of the American Society for Metals.

Established in 1960, the award honors the author or authors under 35 years of age whose paper is selected as the best published in the American Society for Metals publication, *Metallurgical Transactions*.

Sinclair is known for his work on crystal lattice imaging with the use of high resolution transmission electron spectroscopy.

Peg Dickson, executive assistant to the provost, has terminated full-time employment at Stanford to devote more time to family and personal interests. She will continue to be available for short-term staff support and special projects.

Assistant Provost **Noel Kolak** has added the responsibilities of managing Hastorf's office to her duties in faculty affairs. She is now located in Building 10 at ext. 7-4830.

Stanford's Center for Russian and East European Studies (CREES) has established a new scholarly prize in honor of its distinguished longtime head, Prof. **Wayne Vucinich**, the Robert and Florence McDonnell professor of East European history at Stanford.

Announcement of the award was made by Dorothy Atkinson, executive director of the American Association for the Advancement of Slavic Studies at the Association's recent convention in Washington, D.C. The AAASS is now headquartered at Stanford.

The prize, the first of its kind in the field, will be known as the Wayne S. Vucinich Prize. It will be awarded annually for at least five years for the most important contribution to slavic studies published in the U.S. in the previous calendar year. Recipients will be selected by a special committee of the AAASS. Each will receive a cash award of $500.

Michael Wald seeks remedies for kids abused by parents, school teachers

Accepting physical punishment legitimizes force, he warns

Wald working on a new area of academic law – the treatment of juveniles

BY DONALD STOKES

Up to a million children in the U.S. are abused or neglected every year.

Helping them is the deep concern of a 41-year-old Stanford professor of law, Michael Wald.

Wald has gained a national reputation for his development of a set of standards, or model laws, for the legal system to deal with the problem. This effort is part of the Juvenile Justice Standards Project of the American Bar Association, which is trying to persuade all the states to adopt the standards developed by Wald.

Wald's proposals have already influenced both state and federal legislation. He works not only with individual cases but also conducts empirical research studies which break new ground. He also leads in the development of a new area of academic law—the treatment of juveniles.

Wald has for 15 years been pursuing the problem of improving conditions for abused children.

Wald said he did not think the problem was increasing, but that more public attention was now being paid to the problem.

"In some ways I think we physically abuse our children less than used to be the case. Throughout history corporal punishment has frequently been given to children. I think there is less of that now, but neglect and other forms of abuse are common.

"There is more neglect these days, due to the increased number of young, single parents. Gross neglect is usually associated with poverty, and frequently is seen where very young parents are unable to sustain themselves, let alone their children.

"However, it is important to keep all this in perspective. There are 60 million children in this country, and the vast majority are not being abused or neglected.

"Of equal concern to me as parental abuse or neglect are the thousands of juveniles who receive corporal punishment in schools every year. This usually takes the form of paddling on the buttocks.

"I don't think we shall ever lessen the abuse of children until we reach the stage when it is accepted by everybody that people should not hit other people, under any circumstances, and that there are methods for control other than physical force. That is as true for children as for adults.

"While most corporal punishment is probably not harmful, accepting the use of physical punishment legitimizes force. Sometimes it is hard for a parent to draw the line between reasonable punishment and abuse. Thus, all people need to stop using corporal punishment in order to prevent misuse by some.

"Sweden has banned the spanking of children. That would be very difficult to achieve in the U.S. Even in Sweden I don't think they enforce it—it is more a moral statement of guidance."

As part of his work Wald has legally represented children who have been badly treated, and he visits such institutions as foster homes, juvenile detention centers and mental hospitals.

He remembers poignantly the very first child whom he represented legally. Wald was 28 at the time, and was working in the district attorney's office in Ventura.

"That child is often in my mind as an illustration of the care with which one has to deal with these matters, and the power that is in the hands of those made responsible.

"The child in question was an infant boy. I studied the circumstances and found that the mother had had a narcotics problem, but had completed a drug treatment program. I recommended that the baby should be returned to the care of the mother.

"The very day after that baby was given back to his mother they were both killed in an auto accident, after the mother had used narcotics.

"The memory of that incident has remained with me ever since. But I still think I made the right decision. In this sort of work one has to take risks. The easiest course, invariably, is to take a child away from the mother. Yet when we place a child out-of-home usually we do not know what happens to it, or whether the child is still being deprived.

"The awesomeness of the responsibility that courts and lawyers and social workers have in determining what shall be done with suffering children has never been out of my mind."

Also vivid in his consciousness are the frequent visits that Wald has paid to institutions where children are housed.

"Too many of these institutions are inhumane," he said. "That has made me work very hard to keep children out of such places. Also I attempt to improve the quality of care when the resources of the family are inadequate.

"I think of those children who are confined to cells with only small windows and furnished only with a mattress on the floor.

"I think of the 13- and 14-year-olds who have run away from home and when caught are often put into cells with adults.

"There was a case in Idaho this summer where such a child was killed by some of the inmates of a jail.

"I don't say that bad conditions are widespread, but they are all too common."

Asked to name the areas that were worst, Wald replied: "Unfortunately they are all over the nation, urban as well as rural, and they are in a great many states, certainly in California.

"About 60,000 boys and girls are held in adult jails every year, and there are very few adequate adult jails. In California juveniles are usually held in juvenile detention facilities. These vary considerably, from very good in San Mateo to poor in some counties.

"In this state there are only three or four counties which regularly allow children to be put in adult jails, and they are all in rural areas. In some other states it is routine for children to be put in such jails.

The heart of the problem is that we have generally dealt with children in a manner designed to facilitate bureaucratic needs and limited resources, not child development.

"The first essential, after ending the practice of putting children in jails, is to stop warehousing them in large impersonal single-sex institutions.

"Children should be kept in their own homes whenever possible, and if it is inescapable to put them elsewhere they should be placed in facilities accommodating no more than 20 people, and should be allowed regular contact with members of the opposite sex.

Second, we must bring families into the treatment process. Despite our recognition of the relationship between parental actions and child behavior, there have been few meaningful attempts to involve parents in the juvenile court process or in treatment programs. For example, in court proceedings the parents are the forgotten parties; lawyers and judges and probation officers talk to each other, not to the youth and their families.

"Third, we should recognize that developmental and maturing processes continue at least into a person's twenties. Many 16-, 17- and 18-year-old offenders are quite immature. Therefore we must resist pressures to lower the age of juvenile court jurisdiction or to automatically transfer certain

continued on next page

Wald...

continued from page 3

offenders to adult court."

Asked what it costs to house juveniles, Wald said that it costs $1,000 to $3,000 dollars a month to house a child in a juvenile institution.

Wald believes that, to a degree, so-called criminal conduct often seems to be a rite of passage as part of growing up. "The majority of children admit to conduct at some time that violates the criminal statutes. The offenses include shoplifting, vandalism, joy-riding in stolen vehicles, or assault.

"Most of such juvenile 'criminals' are never caught."

One of the projects to which Wald devotes much time is the Bay Area Foster Care Study, on which he works with Profs. J. Merrill Carlsmith, psychology, and P. Herbert Leiderman, psychiatry. Started in 1978, the study compares the development of abused or neglected children (usually from five to 10 years old) who are left in their own homes, as against another group of children who are in foster care.

"If you leave them in their own home you run the risk that they are going to be injured again," said Wald. "If they are put in foster care the risk is that separation from their parents may prevent them from developing firm attachments to adults.

"Not enough data has been collected in the past to form adequately-based conclusions as to which method is best. We are studying a total of some 80 children, and each child has been studied for two years.

"The data collecting part of the project has just finished. I shall be spending most of the next year on assessing the results. It is too early to draw any preliminary opinions."

The majority of children admit to conduct at some time that violates the criminal statutes. The offenses include shoplifting, vandalism, joy-riding in stolen vehicles, or assault. Most of such juvenile 'criminals' are never caught.

—Michael Wald

Wald's major research interests are in applying knowledge about child development—including psychology, psychiatry, pediatrics and other disciplines—to legal policy. For that reason he spends much time working with people from other departments, partly through the Stanford Center for Youth Development.

He teaches a joint course with Prof. Eleanor Maccoby, the noted psychologist. He also does research which gathers empirical information relevant to legal decisions about children.

Wald was asked whether the soaring divorce rate and the prevalance of single-parent homes were major factors in causing the abuse or neglect of children.

"I don't believe so. You have to bear in mind that from 60 to 80 percent of divorced people remarry," he replied. "What we see today is more of a proliferation of step-children and step-parents.

"It also depends on your time frame. Fifty years ago a great many children left school at 14 or 15 and went into employment. In 1900 only 10 percent of children graduated from high school. This means that in those generations children assumed adult roles very early.

"Children today, on the other hand, probably get less time and attention from their parents than they did a generation ago. There are not many studies on this, and the picture is not very clear, especially as there are so many labor-saving devices today which free parents for other activities, but it does seem likely that there has been a decline in family time.

"One clear fact is that more children are being born out of wedlock. Also, many more children will experience the separation of their parents. Fifty percent of all children born in the 1970s will see their parents split up.

"We don't know yet what the implications of these factors will be for children. There are so many new influences today that have to be taken into consideration. There is the effect of TV, the new attitudes to authority as a result of the Vietnam War, changed conceptions of the role of parents. It becomes very difficult to sort out what is actually affecting children, and in what ways."

As early as he can remember Wald knew that he would become a lawyer, although there was no such tradition in his family.

His main interest, however, was sports, and his great hero was Mickey Mantle. His primary concern, when deciding what college to go to—he had an outstanding record and was offered places at several universities—was which one had the best wrestling coaches.

It was for that reason he picked Cornell, where he graduated with high distinction in all subjects. Injuries made him give up wrestling.

At Cornell he was greatly influenced by his thesis adviser, Ted Lowi. He remembers with pleasure three others: Walter Berns, professor of constitutional law, and Walter LeFebre and George Fox, historians.

"These men had markedly different views of the world, they ranged from extreme left to conservative," he said. "I realized from them how much ideology shaped whatever facts one looked at. They all provided me with important frameworks for viewing government and society."

Between them, the four men he admired turned Wald's mind in the direction of making teaching his career. He went to Yale Law School with the intention of teaching when he graduated. He was unsure whether he wanted to teach law or political science, so he took a joint degree covering both disciplines.

He spent his first two years at Yale concentrating on government and law. In his third year came an experience that was to shape his entire future. Anna Freud, daughter of the famous Sigmund Freud, visited Yale for a year, working with Joe Goldstein, professor in the Law School, and Al Solnit, head of the Child Psychiatry Department. The three studied the problems of children from a legal perspective.

"I took a course with Anna Freud and became extremely interested in the work she was doing, and her approaches. I took more courses concerned with children. As a result of these experiences I turned in the direction of studying the problems of children."

Stanford was looking for a young professor of criminal law. Herb Packer, one of Stanford's all-time greats in teaching, was largely responsible for persuading the School to hire Wald.

Wald taught criminal law at Stanford for three years. He also taught courses dealing with children and the family. He took leave from 1970 to 1972, during which time he was first an attorney with the Ventura County, Calif., District Attorney, then attorney in the Public Defender Service in Washington, D.C., and the Center for Law and Social Policy. After that he worked with the Youth Law Center in San Francisco.

His investigations into the law as it affected children became known to a widening audience. He became involved through the 1970s in drafting, on behalf of the American Bar Association, model statutes that could be used by courts and social service agencies in dealing with the problems of child abuse and neglect.

Wald came to occupy a distinctive role as a teacher and educational innovator in the Law School. He became a leader in developing clinical teaching techniques and a fine instructor in more traditional classroom settings.

A senior colleague observed: "Wald has a unique combination of a realistic pragmatism with respect to legal institutions, considerable sophistication in social science methodology, and a knowledge of the value and limitations of quantitative methods."

One of the novel features of Wald's teaching is a course in which students have the opportunity to handle cases in San Mateo juvenile court. This is done under the supervision of Wald and Bill Keogh, an adjunct professor.

"The children concerned get the most concentrated attention from their young lawyers that you can possibly imagine, and it is great experience for the students. The program is good for everybody."

Wald finds his relaxation in bird-watching. When he goes on trips he always takes his binoculars wtih him, so that he can look for new species. He reckons that he has spotted half of the 600 bird species in the U.S.

The rarest bird he spotted was a smew, a European bird which somehow got lost and came to California.

Wald's wife, Johanna, is also an attorney, and she works for the Natural Resources Defense Council in San Francisco. The Walds have two children: Jennifer, their 17-year-old daughter is a senior at Palo Alto High; their son Jonathan is 13.

"We learned a great deal from our children," smiles Wald.

Ph.D. oral exams

MONDAY, NOVEMBER 8

Edward John Bouwer, civil engineering, "Biofilm Transformations of Halogenated Organic Compounds at Low Concentration," 2:15 p.m., Terman M33. **Masood Namjoo,** electrical engineering, 4:15 p.m., ERL-442.

TUESDAY, NOVEMBER 9

Soung Hie Kim, engineering-economic systems, "Markovian Methodology for Encoding and Updating the Prior Probability Assessment on Dynamic Processes," 1 p.m, Terman, Room 329.

WEDNESDAY, NOVEMBER 10

Nancy Langton, sociology, "The Population Ecology of Labor Unions in the Service Sector, 1875-1980," 3 p.m. Owen House Conference Room.

FRIDAY, NOVEMBER 12

Maurice I. Landstrass, materials science & engineering and electrical engineering, "Semi-Insulating AlGaAs:Cr for Use in High Mobility GaAs MISFET Devices," 3:15 p.m., McCullough 240. **Rohan Peries,** chemistry, "Synthesis and Applications of cis-2-Ethoxyvinyllithium; Synthetic Studies on Podocarpus Dilactones," 2:15 p.m., Chemistry Gazebo. **Steven N. Semerak,** chemical engineering and chemistry, "Excimer Fluorescence and Phase Separation of Polymer Blends Containing Poly(2-vinylnaphthalene)," 4 p.m., Chemical Engineering Gazebo. **Timothy E. Townsend,** applied earth sciences, "Discrimination of Iron Alteration Minerals in Remote Sensing Data," 2 p.m., Mitchell 350.

Public policy 'a major whose time has come,' Rosenberg says

Big government isn't the problem.

Notwithstanding the promises of election-year politicians, a simple reduction in the size of government is not the panacea for America's current problems. Unemployment, poverty, inflation, energy crises, and other ills have multiple causes, and their solution requires sophisticated mixtures of governmental and private efforts.

Now, at Stanford, there is a new program in public policy to provide undergraduate students a well-rounded understanding of the sources of and solutions to public problems.

Currently beginning its third year, it was recently approved by the University as an independent, degree-conferring undergraduate major. The program is designed "to train people to make intelligent use of materials and analyses from several disciplines, and at the same time to combine this ability with a deep awareness of the human values which are inescapably involved in public policymaking."

This quote comes from Stanford's original proposal to the Sloan Foundation for a five-year grant to establish a public policy program for undergraduates. A grant of $367,000 covering the first three years was awarded in 1980 and a two-year extension of $260,000 was awarded last spring. The program succeeded so well in attracting students and majors that it was elevated to a regular undergraduate major after only two years.

"The courses have really taken off; it's a major whose time has come," says Nathan Rosenberg, professor of economics and the program's director.

Kevin O'Beirne, a senior from Coronado and a member of the senior class council of presidents, found the public policy major to be exactly what he was looking for.

"When I arrived as a freshman," he says, "I knew I wanted to go into business eventually, and was eager to get started. I took economics, and, to be honest, didn't like it very much.

"My adviser, John Chubb, slowed me down and told me to take my time—to find a major to match my interests. He helped me learn about public policy and its relevance to business. It sounded perfect. It's giving me as much of a background as I could hope for."

Chubb, assistant professor of political science, is the public policy program's associate director. "It offers a totally interdisciplinary approach and pre-professional training," he says.

Social, political factors

The program's purpose is described this way:

"Public policies rely for their effectiveness upon the nature of responses of actors and organizations in the private sector; hence effective public policy analysis and operation needs to be based on a thorough understanding of social, political and economic factors. Similarly private sector decision-makers must increasingly deal with public sector responses to private initiatives."

The program's interdisciplinary approach focuses on "analysis, management and design" of public programs and institutions.

Students must take five core courses "designed to provide a strong background in analytical skills, an appreciation for the operation of large organizations in the implementation of public programs, and training in humanistic studies to prepare the student to understand the sharp conflicts in values that unavoidably pervade many policy issues."

Up to now, Rosenberg points out, "narrow professional specialization confined within academic disciplinary boundary lines has been a serious impediment to the application of knowledge in the formulation of public policy. The training of men and women who will fill management and analytic posts requires a breaking down of these walls."

The program, he emphasizes, "represents a commitment on Stanford's part to providing a liberal, yet structured education at the undergraduate level, in contrast to the many intellectual smorgasbords of the recent past. . . . The course requirements also allow the student sufficient time and freedom to explore other fields as intensively as he or she wishes."

While B.A. recipients will be prepared to work in the public sector or to excel in graduate programs of public policy, Rosenberg and Chubb expect many of these graduates to go to law or business school, or do graduate work in related fields such as political science and economics.

The program blends rigorous foundation requirements with flexible demands on advanced students. Majors must take 35 units of prerequisites in political science, economics, statistics, organization theory and ethics; the 25-unit sequence of core courses; and then 15 units in some problem-focused area, such as energy policy, health care, food and nutrition policy, or the economics of regulation, which the student designs in consultation with an adviser.

The core courses and their original instructors are:

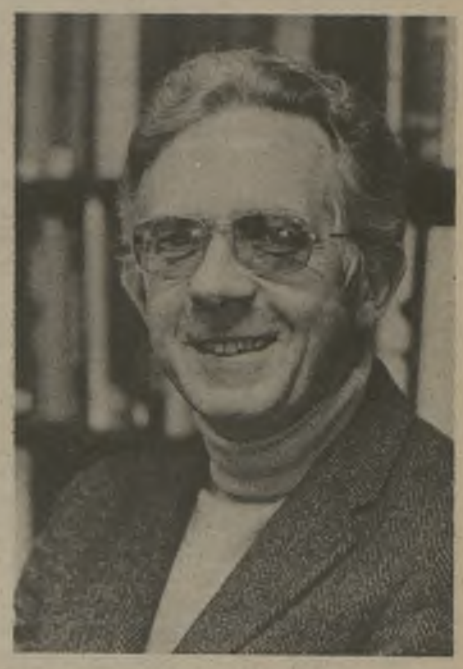
Politics and Public Policy, Prof. John Manley, political science;

Organizations and Public Policy, Prof. Richard Scott, sociology;

Philosophical and Ethical Issues in Public Policy, Prof. Robert McGinn, values, technology and society;

Economics and Public Policy, Prof. James Rosse, economics;

Quantitative Methods and Their Applications to Public Policy, Prof. Lincoln Moses, statistics.



Secret of success

"The secret of our success," says Rosenberg, "is that we recruited and brought into the program highly respected senior faculty members."

Another is that extensive advising time is built into the program. Chubb notes that both he and Rosenberg are available two afternoons a week to talk with students.

"Despite the extensive prerequisites, our core courses are attracting an average of 70 students," says Chubb. "We've enrolled about 25 majors."

The program's faculty members are committed to helping students feel involved. Two or three times a year, there are informal wine and cheese meetings for the majors, and faculty, and other interested students. In addition, there are job seminars.

Successful policymaking must combine the economist's concern (for) efficient solutions with the political scientist's concern (for) feasible solutions.

—Nathan Rosenberg

"The purpose of the program is not to train narrow technocrats," says its initial proposal. "Rather, the purpose is to train people to make intelligent use of materials and analyses form several disciplines, and at the same time to combine this ability with a deep awareness of the human values which are inescapably involved in public policymaking.

"The crucial intellectual step for the student of public policy is to see that all of these different disciplines are valid at some level, but that policymaking requires analysis at *all* of these levels in order to be effective.

"Successful policymaking must combine the economist's concern over the achievement of efficient solutions with the political scientist's concern with feasible solutions. Equally, efficiency and feasibility criteria must be blended with the organization theorist's analysis of large organizations as social contexts within policy decisions are made as well as primary instruments for the implementation of policies. Each of these different levels of social reality has its own unique characteristics, processes and constraints.

"Finally, public policies need to be seen as interacting in a reciprocal way with human values and cherished conceptions of ethical behavior and social responsibilities. Such policies are shaped by and reflect these human values, on the one hand, and they are often fraught with major consequences for such values on the other.

"It is essential that those who are to be professionally concerned with public policy formation should be encouraged to acquire a sensitivity to these important but also frequently subtle and elusive interconnections." **—Harry Press**

Friends of Memorial Church—a new support group for ethical values

A new association, the Friends of Memorial Church, was launched on Sunday, Oct. 24, at a reception in the Atherton home of Roger and Esther Heyns.

Dean Robert Hamerton-Kelly addressed the 100 guests on the Church's need for the continuing help and support of its friends, and the Memorial Church Choir sang.

Specific needs, ranging from pew cushions (to improve acoustics) to the formation of the Church's own Guide service, were listed for those who wanted to support projects immediately.

In explaining the purpose of the Friends, the Church staff referred to the Stanfords' original decision to have a chapel at the center of the quad.

The founders insisted that it be nonsectarian and that all students and members of the community should be welcome there regardless of social or economic status. They wanted the church to be a spiritual and moral influence on the entire university, through teaching the existence of a beneficent Creator, the immortality of the soul, and high moral standards.

In the face of growing skepticism about religion, they hoped the Church would encourage students to develop a philosophy of life characterized by faith, compassionate service to others, and adherence to ethical values.

The Association is *not* a membership in Memorial Church, nor does it signify adherence to any creed or religious belief. It is an association of people who care about the presence of religious and ethical values in the University and wish to help the Church staff in making that presence felt.

The five areas in which the Friends will be active are: dialogue among religions, special projects (such as the Guide to the Church), building community with students, social action issues, and financial needs.

The executive committee of the Friends of Memorial Church includes Hamerton-Kelly, Associate Dean of the Chapel Wendy Smith, Judy Donnelly and David Fulton of the Development Office, congregation member Terry Burton of Palo Alto, and Roger Heyns, president of the Hewlett Foundation.

Those interested in becoming Friends of the Church should contact Wendy Smith, 497-1762.

Memorial Church is the center of campus religious activity

Context users offered alternatives as system's final day approaches

Context users with long-term projects that cannot be completed before the system's closing date of Dec. 31 may use Context programs on a similar computer in the Graduate School of Business (GSB) until July 1, 1983. This temporary arrangement is a special provision for those whose books, dissertations, or similar projects cannot be completed in the next two months.

Announcement of the temporary service was made at one of a series of seminars held to brief users on alternative systems. Application forms for the GSB services are available at the Context Office, 115 Pine Hall (telephone 497-4376).

Context is a computer-based text-processing system that has been operated by the Center for Information Technology (CIT) since the summer of 1981. It is being closed because the system did not generate enough income to cover expenses.

Thus far there have been five seminars for users. Text-processing alternatives reviewed include the CIT IBM 3081 (a large mainframe computer on campus), commercial word processors, personal computers, and the possible use of Context programs on other DEC20 computers at Stanford (Context now uses a DEC2060 computer).

The seminars were presented by Context staff in collaboration with three other divisions of CIT, Adminstrative Information Systems (AIS), Computer Systems and Services (CSS), and Instruction and Research Information Systems (IRIS).

Because closing of Context removes a valuable service for faculty, administrative staff and students who need text-processing capabilities, CIT has accelerated its efforts to improve such services on the IBM 3081 mainframe.

A new full-screen version of the editing system on the 3081 (WYLBUR) is now scheduled to be available around April of next year. In addition, it is planned that a new Xerox 9700 high-speed printer recently installed at CIT will be able to print files prepared with TeX, the powerful text formatting and typesetting program developed by Prof. Donald E. Knuth of the Department of Computer Sciences. TeX has been an important component of Context.

Copy centers move locations, aim for faster turnaround

The Word Graphics Department at Stanford, in cooperation with Green Library, has begun to manage the Green Library Copy Center. The new hours will be 9 a.m. to noon and 1-4:30 p.m. weekdays starting Nov. 8.

The Word Graphics Department, which has made outstanding improvements in quality and service over the last few years, now makes its main copy center at the Graduate School of Business directly available to patrons of the Green Library. This means that 24 hour turnaround is possible for up to 15,000 copies per customer per 24 hour period.

At the same time, the Cubberley Copy Center will be closed and its staff and services moved to Green Library Copy Center. By combining these two centers, Word Graphics will be able to offer Green, Cubberley and other nearby Stanford patrons better service.

Green Library patrons have already begun to notice the efficiency and speed of the "streamlining" concept in copy centers, which had been developed by Word Graphics Manager Arnie Olds and Copy Centers Manager Joan Kruse in the Graduate School of Business Copy Center over the past few years.

Letters to the editor

Panofsky clarifies NAS Panel guidelines

Editor, *Campus Report*:

The front page of the October 20, 1982 *Campus Report* was headlined "NAS Panel Suggests Bar on Foreigners." This referred to the recently released report of the National Academy's Panel on Scientific Communication and National Security, of which I was a member.

The headline is highly misleading and the article following does not do justice to the import of the report to the campus community. A brief outline of those panel recommendations directly affecting Stanford might be in order.

The establishment of the Panel was a response to the ill-advised and threatening actions by the federal government in its attempt to restrict the transfer of scientific information originating from university campuses.

The motivation for such action was the transfer of U.S. technology to the Soviet Union; yet the panel found—with full access to primary data—that universities and open scientific communication have been the source of very *little* of this flow.

In response the Report of the Panel recommended that *access* to or *communication* relating to any university research, be it basic or applied, should be subject to *no restriction of any kind*, unless it met *all* of the following tests:

* The technology is developing rapidly, and the time from basic science to application is short;
* The technology has identifiable direct military applications; or it is dual use and involves process or production-related techniques;
* Transfer of the technology would give the U.S.S.R. a significant near-term military benefit; and
* The U.S. is the only source of information about the technology, or other friendly nations that could also be the source have control systems as secure as ours.

Note that this recommendation would imply that most probably *all* research activities now conducted on the Stanford campus should be open to all.

The panel also recommended that if government-supported research demonstrably will lead to military products in a short time, the work should be classified, and that in consequence most American research universities would refuse to conduct such work on their campuses. Stanford University, under its policy prohibiting delays of publication, would not undertake research in this category.

It is conceivable that a narrow gray area may exist which does not warrant classification but which does meet all of the listed criteria. In that case the panel suggested that *if* such work were to be conducted on campus *no publication delays* should be tolerated and that *access* by foreigners should not be restricted.

However, it was suggested in the report that in such gray areas, particularly those items which involved process or production-related techniques, it would be reasonable to prohibit the outright employment or long-range participation of Soviet or Soviet Bloc citizens in the work. The headline referred to this suggestion.

It was also suggested that in this narrow gray area authors of a paper should be requested, *in parallel* with submitting the paper to a publisher, to also submit to the cognizant government agency the paper for review.

If the government agency representative found certain passages to be undesirable, then by mutual consent the investigator could make modifications; however the ultimate right and freedom to publish should remain with the investigator. The panel also recommended that the provisions of the various existing export regulations (EAR and ITAR) should not be invoked to deal with these gray areas.

In summary, the panel cautioned that universities should be vigilant when considering whether to accept research programs that may develop information that is not to be made available to the public—*either for military or commercial reasons*—lest they compromise the freedom from which they derive their strength. Security by accomplishment rather than restriction has served the Nation well.

I hope that this abbreviated explanation of the Panel's recommendations clarifies the situation which was obscured by the headline in question. Naturally, neither the government nor the universities are bound by the recommendations, but they establish a standard which hopefully will serve to narrow, if not eliminate, differences.

Wolfgang K. H. Panofsky
Director, SLAC

Improper waste disposal causes fire

Improper waste disposal caused a garbage fire at Stanford that resulted in minor injuries to a fire fighter and required several specialists to spend hours sifting through more than a ton of trash dumped from a Peninsula Sanitary Service truck.

The incident underscores the need for better waste disposal practices by everyone at the University, according to Dr. Alain DeCleve, director of health and safety.

Palo Alto fire fighter Philip Constantino sustained facial burns when chemicals left in the trash flashed spontaneously.

The incident began about 3:30 a.m. Wednesday, Oct. 27, after Peninsula Sanitary Service made pickups at Hoover Library, Meyer Library, Herrin, Medical Chemistry, Old Chemistry, and the Sleep Laboratory, among other stops. When the driver noticed that the truck contents had caught fire, the load was dumped on the road between the Museum and the Orthopedic Research Laboratory.

Several University and Palo Alto officials sorted through the pile from 8 a.m. to 2 p.m., locating and identifying such solvents and flammable materials as toluene, acetic acid, sulphuric acid, acetone, paint thinner, anhydrous ether, ethyl alcohol, methanol and small flasks of other, unidentifiable chemicals.

"Those chemicals should not have been there," DeCleve said. Waste chemicals—including used containers—will be picked up promptly and disposed of properly when the individuals concerned contact Jennifer Gates of Health and Safety at Ext. 7-4767.

DeCleve and Paul Andrade are investigating the accident further. "We don't want to accuse; we just want to make sure it doesn't happen again," DeCleve said. "People should be really aware of the problems they create when they dispose of hazardous chemical wastes improperly."

Even apparently "empty" containers usually have enough material left inside to cause problems, he emphasized. While Stanford tries to monitor these materials through purchase, storage, use and final disposal "without the cooperation of faculty and others we can't make the program work," he emphasized.

He praised the "extremely helpful" cooperation of several persons in this incident, including Donald West of the city's loss control program; Mike Miller of Palo Alto Sanitation Department; Peter Burns of Palo Alto water control; Norm Lacey and Gene Williams of the Palo Alto Fire Department; and Stanford staffers Frank Jurian and Jean-Guy Bernard, among others.

Walls bulge but Trancos found sound

About 80 freshmen were temporarily evacuated from Trancos House early Friday, Oct. 29, when several non-bearing walls in the structure buckled several inches.

"It happened as we watched" over 15 minutes, said Marsh McColl. "It was the freakiest thing I've ever seen. It seemed like a mass LSD experience."

"It was like a joke at first," said his roommate, Steve Hoffman. Facilities personnel summoned to the scene said the buckling might snap back soon. They suggested temperature changes may have been the cause. The heat was turned on in the building Thursday.

The flexing resulted in minor wall cracks, comparable to those found in older homes. Part of the Wilbur Hall complex, Trancos was built in the mid-1950s.

The buckling was reported at 12:45 a.m. Some students slept in other dorms nearby, while others returned to the building by 2:45 a.m.

The walls affected were those serving as non-load bearing dividers between individual rooms.

In a report to Robert J. Mibach, facilities manager for residence halls, following the buckling Friday, Structural Engineer Robert R. Mathau said: "Wilbur Hall, Trancos House, is a three-story reinforced concrete structure. The reinforced concrete floors, attic and wood roof are supported by both the reinforced concrete exterior walls and the reinforced concrete walls forming the corridors and stairs enclosures. The first floor is a concrete slab placed on a controlled engineered fill.

"The interior partitions separating the rooms are non-structural and are not relied upon to support the building. These partitions consist of light gauge metal studs lined with plaster board.

"In my opinion, the buckling of these non-bearing partitions was probably due to differential deflections of the floors due to the gradual creep of concrete during the past 28 years.

"These walls may be removed or moved elsewhere without affecting the structural integrity of the building."

Mechanical Engineering 103—a typical class

Rain doesn't dampen the derby 'derby'

There are a number of strange ways a Stanford student can get to the head of the class. Consider the "Derby" Derby in Mechanical Engineering 103.

As rain-drenched spectators cheered, students attempted to pass a tennis ball between individuals in five-member teams, using only student-designed hats. "Derby" Derby was all part of the class' annual project.

The students often looked more like creatures from "The Twilight Zone" than engineering students.

Said class member Bruce Forsland, "The thing is everyone looks so funny, but everyone looks so serious doing it."

As the first in a series of classes required for mechanical engineering majors, ME102 doesn't emphasize structural as much as conceptual design. Each student is required to keep an idea log, into which he or she records all ideas for the Derby, including sketches. Students are graded on the logs, which often number up to 50 pages.

Says junior Jim Miles, "The more you think about it, the better your grade. I've only got about 18 pages, and I'm worried. But if we win, I hope they'll take that into consideration."

The race required some serious concentration. Stretched along the Quad corridor, teams had five minutes to get the ball, somehow, from the first person to the last without touching anything but the derbies.

For teams which tried to be the fastest, like "Andy's Heros," that wasn't too hard. In a winning seven seconds, the team's tennis ball went the minimum twelve feet along derbies constructed like a rain gutter.

Teams which tried for distance, like the "Oom-Pah-Pahs," found the task more challenging. They designed a trolley system approximately 80 feet long. Rigged like a chair lift, the "Oom-Pah-Pahs" tried to transport the ball in a small tram car along a string linking each of the derbies, which functioned like supporting pillars. Although unsuccessful, the team had fun just the same.

"We were going to make an oom-pah-pah, with the Bavarian music and the whole bit," said group member Dave Siegel, "but we couldn't find the music, and it turned out to be too difficult anyway."

The actual race wasn't the only difficulty; even the most ingenious members were challenged creatively to design the derby. Construction materials were limited to one 30-inch by 40-inch sheet of three quarter-inch foam core, a 20-foot piece of string, and some hot glue. At least one clever student found a way to bend the rules by unravelling his piece of string, thus giving him an extra 20 feet to work with.

Said T.A. Scott Kim of this kind of behavior, "The problem is carefully designed to allow all sorts of solutions. We want them to be able to bend the rules a little bit."

Miles said his final design took about 15 hours to conceptualize and another four hours to build, an estimate mentioned by members of other groups as well. Because of the structural difficulties encountered in building the derbies, Kim said that this year's assignment was one of the tougher ones.

Last year's class was assigned to build a "rainbow"—actually, a bridge made of cardboard and styrofoam constructed within a five-minute time limit over the pool in Terman Courtyard. Three years ago, students were instructed to design and build a musical instrument which would play, unattended, for exactly 30 seconds without using electricity, fire power, chemicals, or manufactured mechanisms.

Kim remarks: "We just put out the problem, and people go nuts with creative solutions. Obviously outrageousness is a part of this." —**Amy Bernhard**

Students to manage TMU's new patio grill

The Patio Grill, the barbeque that Tresidder runs located in White Plaza every noon, will soon be run by a student managerial group composed of Shoshanah Ferziger, Stephen Miner and Todd Tuomala. Miner and Tuomala are juniors, majoring in electrical engineering and industrial engineering, respectively. Ferziger is a sophomore majoring in industrial engineering. Collectively they have experience in University food service, fast food restaurant, Marriott's Great America and a country club.

They will operate the Patio Grill each lunch hour, 11:30 a.m. to 1:30 p.m., Monday through Friday. Grilled items and beverages will be available for sale.

The Patio Grill cart will also be available for dorm events, special parties, athletic events, or other special activities. For further information, call 497-4321.

Colleges share 'democracy of poverty,' Kennedy declares

Both public and private institutions "are experiencing the democracy of poverty" in higher education, but "the publics have been hit worse," Stanford President Donald Kennedy said Friday, Oct. 29 in Palo Alto.

He spoke at the 25th anniversary celebration of the Foothill-De Anza Community College District, meeting at Rickey's Hyatt House.

"Measures that prevent public support, whether they operate on local tax revenues or national appropriations policies, are tampering with our national future, and they are plain foolish," Kennedy said.

Public funds—whether federal, state or local—are required to secure access to quality higher education, he added. "In the best of all worlds, that will be a pluralistic system, one that allows scope for various kinds of individual preferences or timetables. It needs Foothills, De Anzas, San Jose States, Stanfords, Cals, Pomonas. At stake is nothing less than the intellectual capital on which we will have to run this country."

A convergence of forces now has hit the public sector of higher education hard, he noted. These include "the New Federalism, which transfers responsibilities to the states, but not the resources to meet them; the withdrawal of federal funds for student aid and research; and, especially in the Midwest and Northwest, ailing state economies."

While Stanford is "comparatively better off so far," he added, this depends "heavily on the generosity of our alumni and friends in allowing us to replace public with private dollars for financial aid, on the capacity of our faculty to generate its own research support, and to the now frayed tolerance of our tuition payers.

"But next year's budget is the most difficult we have yet faced, and over the next three or four years our financial future looks perilous."

Kennedy noted that:

"The number of community colleges in America is growing, as is the demand for their services. Nationally, in the 20-year period from 1960 to 1980, the number of such institutions grew from 663 to 1,219. The projections are for a four percent increase in enrollment this fall over last year. In the meantime, applications at four-year institutions are declining.

"That suggests that you are doing something right. And you are. Community colleges offer everyone a chance. They prepare students for a wide range of career choices.

"They are responsive to the needs of the community, of business, of industry. They are flexible, and durable. They have classes and will travel. They are experienced in serving a growing adult population. Their programs are shorter, and strongly focused. And, of course, they are affordable. (Or at least they have been.)

Enroll NOW for life insurance coverage through University

If you already have Stanford life insurance. . .

. . .and think you don't have to do anything further to enroll in the new life insurance program, guess again.

Coverage under the old plans will cease Nov. 30. Those who want to have coverage beginning Dec. 1 must enroll in the new plan by Nov. 10.

If you do not enroll now and want the life insurance later, you will have to present satisfactory evidence of insurability to obtain coverage.

The special life insurance office in the Old Pavilion (ext. 7-0757) is open from 9 a.m. to 4:30 p.m. to answer questions, send information packets to those who lost them or threw them away, and wonder why everyone waits till the last minute to do what they could have done two months ago.

And even if you don't want to buy life insurance, you can name a beneficiary for the $5,000 policy provided by Stanford for every faculty and staff member.

Student follows Kennedy's advice, analyzes President's talk at Oregon

Senior English major Thomas W. Wood offers the following as a rejoinder to President Donald Kennedy's address to the University of Oregon fall convocation on Oct. 4. The text of his remarks appeared in the Oct. 6 Campus Report.

Although I am not myself a freshman, after reading the latest issue of the Stanford *Observer* and being much inspired by President Donald Kennedy's challenge to the members of the class of '86 to develop "confidence in (their) own capacity to analyze, interpret, project, experiment and reason" and to include in their thinking the "suspicion that they ("they" being the class of '86's professors) may have it wrong," I decided to accept this challenge myself and to put it into practice by taking a close look at the language in President Kennedy's own fall convocation address to the University of Oregon.

I hope that by doing so I will encourage others to examine with care the words of those whose trust it is to help us to grow as thinking human beings during our time here at Stanford.

Excerpt One: A tight, effective interplay between biological and cultural evolution. . . has produced a rate of change in the cultural milieu that is bewildering and sometimes frightening.

How does a "tight" and "effective" interplay between biological and *cultural* evolution produce a rate of change in the *cultural* milieu that is "bewildering" and "sometimes frightening?" The only "tightness" that would help an "interplay" to produce a bewildering and frightening rate of change in the relationship between its own constituent partners would be a "being closely held or fastened," a tightness like that between a python and a field mouse. As for "effectiveness," since the interplay is ultimately producing bewilderment and fear, surely "effective" here cannot mean successful." Moreover, since the results of evolution are said to be random, "effective" here cannot mean "reaching its goal," either.

It could mean "impressive," although that meaning would hardly be cheering; an atomic explosion is certainly no less "impressive" than an evolutionary interplay. My guess would be that "effective" here is merely "having effect," a meaning that tells us next to nothing about the interplay, since virtually anything "has effect." No, an interplay between partners that results in change in one of those partners at a rate that is bewildering and frightening cannot be described either as "tight" or as "effective."

Excerpt Two: This close coupling between the two kinds of evolution offers the optimistic suggestion that in time there is likely to be a complementary relationship between our biological endowment and our cultural arrangements.

Do "couplings," even close ones, "offer suggestions"? Even if they do, they might have been embarrassed to offer this one, since all the evidence that I, at least, know of, "suggests" that if there is a trend between these evolving partners, it is away from, rather than towards, a complementary relationship. Perhaps never have our "cultural arrangements" borne less relation to our "genetic endowment." In fact, "cultural arrangmements" such as, say, chemical plants, are busily re-arranging our "genetic endowment" as I write.

Excerpt Three: What Darwin had accomplished. . . was the demonstration that a single way of knowing was no longer possible.

If this is true, then why, since Darwin's day, has one and only one way of knowing, namely, the scientific way of quantitative demonstration, become increasingly the one and only acceptable, the solely respectable, approach to knowledge?

When governmental agencies or corporations (or even universities) are trying to reach important decisions, do they limit themselves immediately to mathematical models of research and development? Or do they consult, as well, philosophers and poets, astrologers and priests? It seems that if Darwin did indeed demonstrate that a single way of knowing was no longer possible, his scientific children have failed to grasp his demonstration.

Excerpt Four: Finding an ethical path within our new vision of self is one of the great tasks of contemporary humanism.

This is a task that we will certainly fail not only to complete, but even to begin, as long as the humanities are dominated by the quantitative methods of science, methods which, by their very nature, exclude consideration of the ethical.

Excerpt Five: There is no one single objectively verifiable world; there is, rather, the cat's world, the bird's world. . . .

Is this statement itself objectively verifiable? If it is verifiable, is it so only in the world of human senses and human instruments of measurement? Or is a cat or a bird (each in its respective world, of course) free to object to it?

Moreover, is President Kennedy actually suggesting that my cat and I are in totally different worlds? If so, then what have I been feeding in my backyard? If not, if my cat's "world" and my "world" are not totally different, then what does Mr. Kennedy mean by "world"? Does he mean it in the sense one finds in a phrase like "the business world"? If so, my world and my cat's world perhaps differ little more than do "the academic world" I spend my daylight hours in and "the office world" in which my friend spends hers.

Furthermore, I, at any rate, view it as significant that when I approach my cat to scratch her back, she responds to me as if I were something familiar, as if I were what I assume is the equivalent, in feline experience, to a human being. In short, when I approach her, thinking that she is a cat, she does not run away from me, thinking I am a carnivorous tuba.

Finally, when my cat and I are both in the backyard, and a dog suddenly appears at the fence, she and I both respond by training our respective senses on the same spot; one of us does not respond by looking up a tree, although this might well be my cat's second response to the appearance of the dog.

My point, then, is this, that in taking the case of my cat and me, one is not confronted with two different worlds, but with two interpretations, one feline, one human, of the same world. Only a science in which reality had given way to methodological zeal could move an intelligent and capable man like President Kennedy to utter what, even to an untutored ear like mine, is complete nonsense. Now, if you will excuse me, I have to get my cat her dinner.

In my introduction to this analysis of President Kennedy's convocation address, I stated that my purpose was to encourage others, particularly the members of the class of '86, to undertake their own analyses of what they see and hear at Stanford. I would like now, in closing, to state my second purpose.

Assertions like those of President Kennedy in his address are by no means unique. Nor has the inadequacy of the beliefs that they express escaped detection; many able critics, most recently Prof. Robert C. Cohn in an article in the *Campus Report*, have exposed this inadequacy. What has seldom been attempted is a demonstration of the incoherence of such beliefs. My second purpose in offering this analysis has been to provide just such a demonstration. An inadequate view is undesirable; an incoherent view, quite literally, is unthinkable. When the president of a great university finds himself lauding incoherence as a guide to the future, perhaps it is time for all of us to think again.

Health insurance costs soar

In a letter to all faculty and staff this week, Manager of Benefits and Records Jeannie Thomas announced the open enrollment for health plans and the new health plan rates for calendar year 1983.

The open enrollment period will be November 10 to December 10, 1982. During this time eligible faculty and staff may 1) enroll in a base health plan without providing evidence of good health, 2) add dependents, and 3) change from one plan to another. The new coverage becomes effective January 1, 1983.

"The rate increases for 1983 are significantly higher than those the University has experienced in previous years, especially in the Blue Cross plan," Thomas explained.

Rate increases for the plans are: Bay Pacific 20 percent; Blue Cross 63.7 percent; Kaiser 16.3 percent; TakeCare 17.5 percent and Major Medical 18.5 percent.

The percentage increase realized by employees in each of these plans will be different from the percentage stated above depending on whether or not eligible dependents are covered.

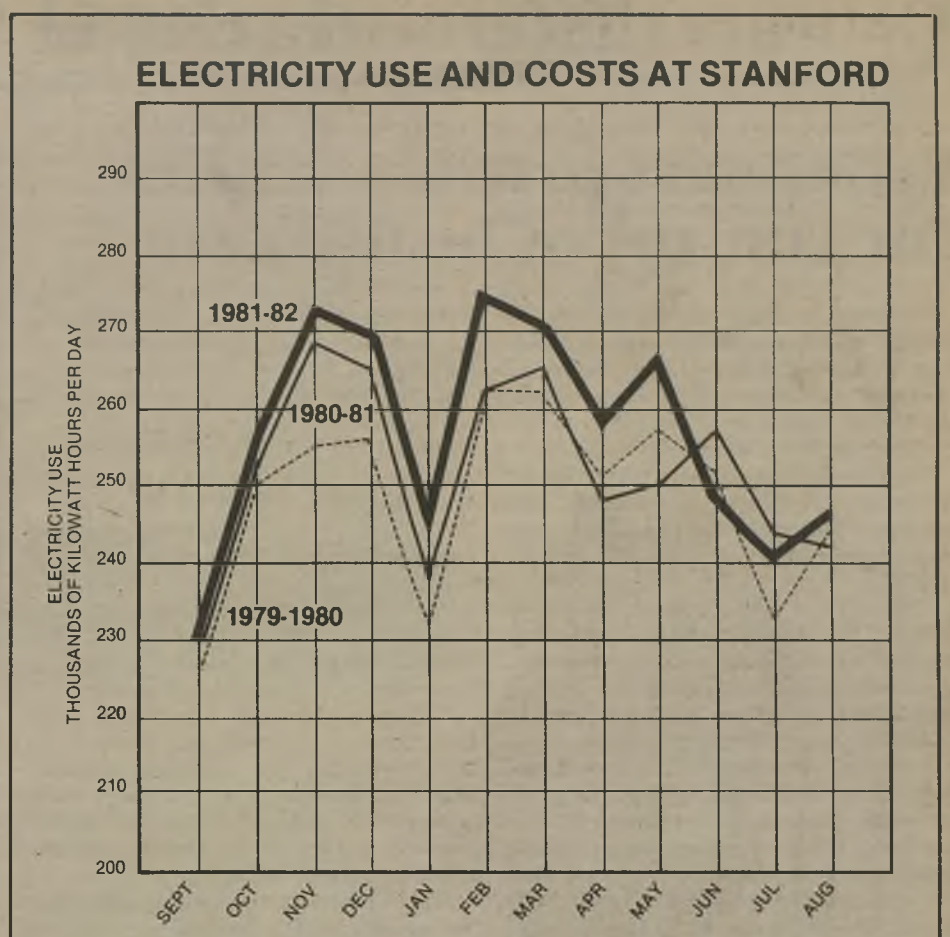
"In the case of Blue Cross, the plan is experience rated," Thomas said. "This means that the costs are a direct result of how much money is paid out in claims to Stanford faculty and staff each year. The fact is that our employees have increased significantly their use of the Blue Cross plan. Blue Cross is paying out in claims much more than they are receiving in premiums; therefore they increased the rates dramatically," Thomas explained.

"We are seriously concerned about the impact of these cost increases on faculty and staff," Thomas said. "During 1983 we will be working to redesign the current plan to allow for more choices of coverages and rates for 1984."

Plans such as Bay Pacific, Kaiser and TakeCare are Health Maintenance Organizations (HMOs). These plans control their costs more effectively through the use of designated physicians and hospitals. Rate increases for these plans are community-rated and reflect anticipated costs based on utilization by the entire community, not just the University.

Thomas commented further about the trend of health care costs. "The current projections of annual medical cost inflation are in the 20-30 percent range. In general, the consumers of medical services have been unaware and unconcerned with rising medical care costs: in health plans such as Blue Cross and Major Medical, consumers have had little or no incentive to hold costs down. Through employer's plan designs, group health benefits have provided protection against virtually all types of illness and injury with minimal out-of-pocket expenses for the employees. Thus employees have been isolated to a great degree from the true cost of health care services. Additionally, technical advances have improved the quality of medical care and saved many lives. Hospitals and other providers have had to increase costs to cover expenditures for new and advanced equipment. Also, as people live longer they add to the utilization and costs."

To help offset the significant rate increases for 1983, the University is increasing its contribution for employees from $30 to $40 per month. The $40 is added to the subscriber-only cost of the least expensive plan, this year Kaiser, making the total University contribution $89.89 per month. This amount is applied toward the cost of employee coverage and the coverage of eligible dependents in whichever plan the employee chooses.



Below is a chart listing the health plan rates effective January 1, 1983. Payroll deductions for January coverage will begin with the December 22 paycheck.

During the open enrollment period and thereafter, the Office of Benefits and Records in the Old Pavilion is extending its hours from 9 a.m. to 4:30 p.m., including the lunch hour. A new telephone line will be added for insurance questions. The new number will be published in the Nov. 10 *Campus Report*. In the meantime, you may call 7-1777 if you have questions concerning health coverage. Employees at SLAC may call the SLAC Benefits Office (ext. 2357).

	Full Time			Half Time**	
	Cost	Stanford Pays	You Pay	Stanford Pays	You Pay
Kaiser Base Plan					
Subscriber only	$ 49.89	$49.89	$ 0.00	$24.95	$ 24.94
Subscriber and 1 dependent	99.78	89.89	9.89	44.95	54.83
Subscriber and 2 + dependents	143.95	89.89	54.06	44.95	99.00
TakeCare Base Plan					
Subscriber only	$ 69.30	$69.30	$ 0.00	$34.65	$ 34.65
Subscriber and 1 dependent	137.10	89.89	47.21	44.95	92.15
Subscriber and 2 + dependents	182.10	89.89	92.21	44.95	137.15
Blue Cross Base Plan					
Subscriber only	$ 89.12	$89.12	$ 0.00	$44.56	$ 44.56
Subscriber and 1 dependent	168.91	89.89	79.02	44.95	123.96
Subscriber and 2 + dependents	223.51	89.89	133.62	44.95	178.56

Subscriber and 2 + dependents	175.67	89.89	85.78	44.95	130.72
Major Medical					
Subscriber only	$ 8.73	$ 8.73	$ 0.00	$ 4.37	$ 4.36
Dependents with Base	23.13	*	*	**	**
Dependents without Base	32.29	*	*	**	**

* For eligible employees appointed 75 percent time or more, the University will pay $8.73 per month for the employee's Major Medical coverage and also will contribute a maximum of $89.89 toward a base medical plan. If any balance remains from the maximum University contribution, the balance will be applied toward the cost of the dependent Major Medical coverage.

** For eligible employees appointed less than 75 percent, but at least 50 percent time, the University pays one-half the amount in the full-time "Stanford Pays" column. If any balance remains, then it will be applied toward the cost of the dependent Major Medical coverage.

How electricity costs are rising:
(Stanford's bills for the last three fiscal years)

1979-80: $3,802,123
1980-81: $4,895,625
1981-82: $6,973,386

Electricity costs jumped 42 percent to nearly $7 million during 1981-82

Stanford's electricity bill increased by a whopping 42 percent in the last fiscal year, largely the result of a $2 million PG&E rate increase.

Electricity costs should remain stable for the next year, but natural gas costs are expected to rise 20 percent.

Electricity rates have actually declined in recent months because of the large amount of inexpensive hydroelectric power that has been available from last winter's record snowfall. Gas prices will go up due to the Reagan administration's active pursuit of deregulation.

Electricity consumption rose 1.6 percent last year, a substantial improvement over the 2.5 percent increase recorded during the 1980-81 fiscal year.

About half of the increase can be traced to a change in operating practices in Stanford's Central Energy Facility. Plant personnel are producing more chilled water for air conditioning with electric chillers rather than with natural gas-fueled steam chillers. Despite the increase in electricity consumption, this change resulted in a net savings of $180,000 last year.

Other variations in electricity use result from increases in building square footage, installations of experimental and office equipment, and the weather, which affects use of electric heating and air-conditioning equipment.

Conservation efforts continue to pay off. For example, Stanford realized electricity savings of nearly two million kilowatt-hours, or about $150,000, from just two projects: the campus lighting modifications and the Graduate School of Business building retrofit.

Pre-law conference coming Nov. 11

This year's annual Pacific Pre-Law Conference will be held at Stanford University Thursday, Nov. 11.

Sponsored by the Academic Information Center at Stanford, the conference will be held on the second floor of Tresidder Union from 10 a.m.-3 p.m. It provides a unique opportunity for individuals interested in legal careers to meet with representatives from more than 50 law schools.

In past years, all American Bar Association-approved law schools in California have been represented, as have many law schools in the mid-west and the east-coast.

Pre-law advisors have designed the conference so that undergraduates may meet law school admissions officers in an informal setting. The conference gives students a chance to discuss their personal interests and backgrounds with representatives or to find out more about specific programs at individual law schools, such as the existence of legal aid clinics, programs in law related to women's issues, or the availability of courses in international law or taxation.

In some cases, law schools will be represented by students as well as admissions officers. In prior years, several hundred students from more than 25 Bay Area colleges have attended the conference.

Medical Center MEMO

Economist predicts battles for control of health care

"Physicians face the likelihood of several unpleasant battles for control of health care," warns Victor Fuchs, a respected Stanford University health economist and a leading figure at the National Bureau of Economic Research.

Among the battles is one that reflects a larger set of issues. "This battle pits university physicians and hospitals against community physicians and hospitals," he said.

"Biomedical research funds are flat or falling," Fuchs said. "Medical education support is dwindling and, increasingly, the university medical centers are looking for patient care to shore up their revenues.

"At the same time, these centers dread the notion of having to compete for patients in a tight economic environment. In many cases their concern is well justified. When it comes to delivering bread-and-butter care, the chances are the community physicians and community hospitals can render this care less expensively.

"On the other hand, community physicians also feel threatened. They see these gleaming medical centers, big and powerful, and they see the famous specialists, and they wonder how the medical centers will use their power, and whether it will be at the expense of community physicians and hospitals."

Fuchs expressed his views in a recent article in *Health Affairs*, a professional journal.

The Stanford economist said the conflict among physicians is exacerbated by the proliferation of activities at the frontier of medicine that should be done primarily in medical centers, but which increasingly are being undertaken in community hospitals.

"This proliferation frequently is bad economics and bad medicine," Fuchs wrote. "Eventually, this conflict is going to produce a need for better understanding, a need for compromise, a need to realize the legitimate concerns of each part of the health care enterprise."

Fuchs said he is particularly concerned about what will happen to medical research.

"Without research, without advancing the state of knowledge, medicine will begin to run up against blank walls," he said. "There is only a limited amount of improvement in health that can be purchased by increasing the number of physicians or by adding hospital beds.

"The great advances have always come from figuring out better and newer ways of preventing or treating disease. Somehow there have to be enough funds generated in medical centers to support research and to employ faculty who are actively engaged in research."

Fuchs feels society would benefit from the evolution of a medical care system where academic medical centers concentrated on research, teaching, and activities at the frontier of medicine, and did only as much primary and secondary care as necessary for them to carry out their principal missions.

"Complex, tertiary care," Fuchs wrote, "should be limited primarily to regional medical centers because they provide the specialized services more efficiently, offer higher quality of care, and carry out the research that should accompany all innovations in medicine."

Internal battles for control of health care also take place, said Fuchs, and are not limited to the academic medical centers. It is a general problem within the entire health sector in which practicing physicians and the managements of their hospitals are also fighting for control.

Curiously, government has not been

Victor Fuchs

one of the chief contestants. "This may come as a surprise," Fuchs said, "because the battle for control of health care is often depicted as one of medicine against government.

"Unfortunately, the medical profession is not using this breathing space as creatively and as constructively as it might. This is a shame because, while the regulatory threat went away for a time, medicine should not think that it has disappeared forever. It could come back quickly and heavily."

Fuchs urges physicians and other health care specialists to try to understand the reasons for conflict and to work for change.

"Let practicing physicians concentrate on treating patients and on less intensive forms of care," he advised. "Let academic physicians in medical centers concentrate on teaching, research, and tertiary care and only as much primary and secondary care as is necessary.

"Unless the necessary compromises are struck, American medicine will be consumed with conflict in the years to come, and patients and society will be the major sufferers." —**Spyros Andreopoulos**

Fire results in some damage to King's suite

An early morning fire erupted in a small storage room in the administration suite at Stanford University Hospital Tuesday, causing an estimated $2,500 damage to drywall, paint and carpet, Palo Alto fire officials said.

No injuries were reported. Security supervisor Bob Hurlbert said personnel in nearby patient units detected a faint odor of smoke through the ventilation system, "but we heard no patient complaints."

The 8-foot-by-5-foot storage room was completely gutted, and adjacent work areas of the suite sustained smoke and water damage. Ellen Davia, assistant to Hospital Director Sheldon King, estimated damage to supplies at about $20,000, including approximately $12,000 to a leased copier machine which was stored inside the room.

In addition, a $5,600 word processing machine and a $3,500 electronic typewriter stored just outside the room both sustained water and/or smoke damage. Other items destroyed in the room included paper supplies, computer disks, "and about five pieces of mail which were waiting to go out; we're going to have to sit down and reconstruct them," said Davia.

Cause of the blaze was under investigation, said Palo Alto Fire Inspector Dan Heiser. Davia said the room was locked at 8:45 p.m. Monday night when she left the office. The copier was turned off, she said, although it had a history of minor malfunctioning and may have been the source of the blaze.

Hurlbert and other members of the Hospital fire brigade began fire fighting efforts which were completed "in about a minute" after 15 city firemen in seven units arrived shortly after 7, said Palo Alto Fire Capt. Wayne Evans.

The suite is occupied by King and other top Hospital administration and support staff. The staff returned to their desks and offices about 9 a.m.

...News Notes...

Dr. Barry Tharp, associate professor of neurology and pediatrics, has been appointed to head the division of pediatric neurology at Stanford, announced Dr. David Prince, chairman of Neurology.

Tharp joined the Stanford faculty in 1969 and has served as director of the Clinical Neurophysiology Laboratories. His major research interests have been epilepsy and brain development, and he is widely known for his work on the development of the electroencephalogram (EEG) in premature and newborn infants.

Tharp was elected president of the American Epilepsy Society in 1980. In his new position he is replacing Dr. S. David Holtzman. Holtzman is leaving Stanford for Tulane University in New Orleans, where as a full professor he will institute and head a division of pediatric neurology. Holtzman has been on the Stanford faculty since 1973.

Two Stanford faculty members will be among the speakers at the 68th Scientific Assembly of the Radiological Society of North America, to be held in Chicago, Nov. 28 to Dec. 3.

Dr. Barbara Carroll, assistant professor of radiology and chief of the diagnostic ultrasound section, will present her paper, "Sonography of the Normal Neonatal Adrenal Gland."

Dr. Diana Guthaner, assistant professor of radiology, will discuss both "Left Ventriculography using Intravenous Digital Subtraction Angiography," and "Evaluation of Aortic and Peripheral Vascular Disease using Digital Subtraction Angiography."

Also speaking at the meeting will be two Stanford diagnostic radiology residents. Dr. David Oppenheimer will present "Sonographic Evaluation of Umbilical Artery Catheter Associated Complications." Dr. Fred Burbank will address "Determinants of Digital Subraction Angiography (DSA) Contrast Enhancement."

* * * *

David Hopkins and Margaret Brandeau presented a paper entitled "A Patient Mix Model for Hospital Financial Planning" at the 1982 conference of the Operations Research Society of America/The Institute of Management Science, held last week in San Diego.

Hopkins is director of the SUMC Office of Analysis and Planning and executive assistant to the vice president for medical affairs. Brandeau is a Ph.D. candidate in Stanford's department of engineering-economic systems.

Hopkins and Brandeau formulated a linear programming model to examine the impact on hospital finances of changes in patient mix under current and proposed government reimbursement regulations. The model was then used in policy analysis.

Union election starts Friday

About 1,200 maintenance and service employees at the Hospital are eligible to vote Friday and Saturday on whether they wish to be represented by Local 715 of the Service Employees International Union, AFL-CIO.

The National Labor Relations Board is conducting the election from 6:15 a.m. to 6 p.m. on Friday and 1:30 p.m. to 5 p.m. on Saturday. Employees who work in the main Hospital (or who begin their work day by "punching in" at the main center) are to vote in W001-W003, while personnel who work at Hoover Pavilion (or who "punch in" there) must vote in Room 201.

Supervisors have lists of workers eligible to vote. Personnel will be given time off with pay to cast their ballots.

After the votes are counted Saturday night, information about the election will be available by calling the Medical Center News Bureau, at 497-6911.

Herpes is topic of upcoming Progress in Medicine series

Sexually transmitted herpes viruses, their risks, prevention, and promising treatments, will be the focus of a three-part "Progress in Medicine" lecture series, sponsored by Stanford University Medical Center Nov. 9, 16, and 23.

Each lecture is open to the public free of charge, and will take place 7:30 p.m. in the Medical Center's Sherman Fairchild Auditorium.

Drs. Thomas Merigan, Anne Yeager, and John Mills, three eminent researchers in infectious diseases, will describe recent advances in understanding and controlling both varieties of the herpes simplex virus, a source of cold sores and genital infections that afflict at least 15 million Americans, and its lesser known viral relative, cytomegalovirus (known as CMV).

A usually innocuous virus contracted by 40 percent of all Americans sometime during their lifetime, CMV has been found sometimes to suppress the immune system in laboratory animals and humans, and to convert normal cells to cancerous ones in test tube cell cultures. CMV is also known to cause severe disease in recipients of organ transplants who are given drugs that suppress their immune systems.

As a part of the first lecture, Mills, a visiting scholar at Stanford from the University of California, San Francisco, will discuss his studies of the role CMV plays in a mysterious crippler of the immune system that has killed hundreds in the last year in an epidemic that stretches across the continent. Labeled "acquired immune deficiency syndrome" (AIDS), the disease seems particularly prevalent in male homosexual communities, for reasons still unclear to researchers.

AIDS, which is frequently accompanied by herpes simplex or CMV, strikes by stripping away a sufferer's resistance to infection, leaving him vulnerable to bacteria and viruses that a healthy person can thwart.

Thomas Merigan

John Mills

Yeager, an associate professor of pediatrics at Stanford, will describe the effects of herpes simplex and CMV on young children in her presentation Nov. 16, entitled "Risks for Fetuses and Infants in Contact with Infected Adults."

Both herpes simplex and CMV can be deadly for the fetus and newborn, whose immune systems are still underdeveloped. Yeager was instrumental in developing a test for CMV in transfused blood. Use of the test to screen all blood given to newborns at Stanford has nearly eliminated the threat to these patients.

Merigan, a professor of medicine and leader in Stanford's research on the antiviral compound interferon, will discuss "Present and Future Methods of Prevention and Treatment" of herpes Nov. 23.

In collaboration with the bone marrow transplant program at the University of California, Los Angeles, Merigan recently gave transplant patients blood plasma containing high concentrations of anti-CMV antibodies. (Because of the strong radiation treatments the transplant candidates undergo, their immune systems are extremely suppressed and their risk of contracting CMV is high).

Results of the study, published in the July *Annals of Internal Medicine*, showed that while the CMV infection itself was not prevented by the antibody boost, dangerous complications of the infection, such as pneumonia, hepatitis, and encephalitis were significantly reduced.

The researchers currently are repeating the experiment with a modification: instead of giving the antibody as a component of plasma, which can only be given in small, limited quantities, they are now injecting the patients with pure antibody, in hopes of maximizing the therapeutic effect.

In addition to attempting to prevent CMV infections, Merigan and colleagues are testing antiviral drugs such as leukocyte interferon and adenine arabnoside to halt the infection once it starts. As yet, no effective standardized treatment exists for the herpes viruses, Merigan said, though several promising drugs have recently been made available for testing.

"These are the first drugs that seem active against these infections and I think we'll see them widely studied in the next few years," he said. "There are other drugs coming up which will be even more effective, judging from the first experiments in animals.

"I'm not saying these will cure the infection," Merigan cautioned. "The real challenge for the future will be total prevention. Right now these are hopes, and we need further understanding of the disease mechanisms in order to pinpoint factors that cause their occurrence."

The Progress in Medicine lectures were initiated at Stanford in 1966 by Dr. Joshua Lederberg, then professor and chairman of the Department of Genetics, to provide an opportunity for leaders in academic medicine to share their insights and perspectives with the community.

Seats for the lecture will be made available on a first come, first served basis, so early arrival is recommended.

Those interested in further information or registration forms should call the Medical Center's office of public events at 497-6389.

—Deborah Franklin

Barchas offers glimpse into psychiatry of the future

Imagine a psychiatric clinic of the future.

A patient comes to the psychiatrist's office, obviously in a severely agitated or depressed state.

A blood sample, or perhaps a spinal fluid sample, will be drawn from the afflicted person. The analysis of the substance will be put into a mass-spectrometer, a $175,000 sophisticated machine now found in a small number of psychiatric research laboratories.

Simultaneously, the psychiatrist will draw from the patient a clinical history of his mental illness. Then, on the basis of the history and testing, the psychiatrist will be able to discuss with the patient the disorder and the subtype that the patient has. From the testing they will be able to identify immediately the optimal drug therapy.

That pharmacotherapy, combined with psychotherapy, will provide more specific, rapid, and effective treatment.

This vision of the psychiatry of the future was described recently by Dr. Jack Barchas before an overflow crowd in the Sherman Fairchild Auditorium of the Stanford University School of Medicine. His talk on "Psychobiology: New Approaches to Mental Illness" was sponsored by the Friends of Psychiatry and Behavioral Sciences at Stanford University Medical Center. The talk centered around new developments in the area of behavioral neurochemistry and the ways in which the new information might impact on diagnosis and treatment.

Barchas, a professor and director of the Nancy Pritzker Laboratory of Behavioral Neurochemistry at Stanford, is considered a rarity among the 30,000 psychiatrists in the United States. This is because perhaps only less than two dozen of them, like Barchas, are devoting their professional lives exclusively to researching the basic causes of mental illness at the biochemical level.

Schizophrenia no longer pertains to just that old bromide of split personality, according to the newest research findings. "It is most likely," said Barchas, "several different illnesses, say half a dozen, that we lump together because right now that's the state of knowledge. But information is developing very rapidly."

His laboratory, with private and government support, he said, is totally absorbed in a scientific search to discover what happens in the brain to cause severe mental disorders, such as schizophrenia that affects one percent of the nation's population, depression which affects five percent, and various addictive states.

A key aspect of the search at Stanford is the involvement of several faculty members who work together in a collaborative way.

Barchas emphasized those cross connections which include a close collaboration between the members of the Pritzker Laboratory and the Stanford Mental Health Clinical Research Center, directed by Dr. Philip A. Berger, associate professor of psychiatry.

At the Clinical Research Center, patients can be studied in careful detail with excellent monitoring of clinical status. Patients there may also be studied in a medication-free state. "We all owe a great deal to these volunteers who are willing to enable studies to take place in the hope of preventing others from having similar problems," said Barchas.

"Half the beds in hospitals in the United States," noted Barchas, "are devoted to patients in one or another form of psychiatric illness. Forgetting the pain of the families involved, these diseases probably cost the country over $51 billion a year in lost productivity and medical costs.

"The issue of research funding for mental illness is an overwhelming problem. Researchers in the field of psychiatry have fewer funds available in real money than in 1969."

Barchas noted that the annual spending for mental illness research is $6 per patient compared to approximately $100 and $200 spent respectively for heart disease and cancer research. The absolute amounts spent on research in mental illness are low compared to that for other serious disorders.

He said there has not been a strong tradition for government policy to support research into mental illness with the vigor that occurs for other serious illness. The private sector has also not been as active and there is not the type of private support which exists in other areas of health.

"Yet there's been an explosion of knowledge which needs to be explored," he said. "The basic sciences of neurochemistry and neuroscience have developed important information that is now incorporated into psychiatric research.

"We're learning all sorts of things, such as what neurotransmitters are present and how they work biochemically and physiologically. There was very little study of these problems until a few decades ago."

At that time, one of the shining lights of discovery that opened a new vista into the complex mechanisms of the human mind was turned on by a Swedish scientist, Arvid Carlsson. During chemical analysis of transmitters in the brain, he noticed a previously unrecognized spot on a sheet of chromatographic paper. It had never been identified before, explained Barchas, and

Ronald Merrell

Friday's SMASH

"Transplantation of Islets of Langerhans" will be the topic of this Friday's S*M*A*S*H lecture, to be given 4:30 p.m. Nov. 5 in Fairchild Auditorium, by Dr. Ronald Merrell, assistant professor of surgery.

The lecture is open to all interested members of the Stanford community, and will be followed by a TGIF gathering in the Fairchild lobby.

Construction Corner

Item: Construction will soon begin on the Edwards Deck Development at the west end of the Edwards Building. This project involves 3,430 gross square feet of laboratory and lab support space, and a new central glasswash facility to be utilized by the Pathology and Surgery Departments.

Wells Hoeltje, of the SUMC Facilities Office, will serve as project manager, and Mayta and Jensen will be the construction firm on the project. The construction, costing $1.1 million, is anticipated to be completed in the summer of 1983.

Item: The construction of the space for Cardiovascular Surgery's temporary location on the north wing of the third floor of the Boswell Building has been completed. The space will serve as the offices of the department, pending completion of the Cardiovascular Research Building.

Item: The billing department of Patient Accounting has moved its offices to the second floor of the Old Barn on Welch Road, effective Oct. 28. The two main phone numbers now are: 497-7651, and 497-6655.

Editor's note: *This new regular column is prepared by members of the Facilities Department and intended to keep readers informed of relocations, renovations, and matters involving the physical facilities of the Medical Center. Watch for further updates in future "Construction Corners."*

Social worker reflects on nurturing role

A small child refuses to go to school day after day, but doctors find nothing physically wrong with him. He doesn't know why he can't go, he only knows that he's afraid. A social worker's gentle prodding in family therapy sessions reveals a source: his parents' marital problems have left him frightened that if he goes to school, they won't be there when he comes home.

"...to know other people starts with knowing yourself..."

—Cleo Eulau

"Social work is very near the core of emotions," said Cleo Eulau, chief psychiatric social worker in the Medical Center's department of psychiatry as well as in the coordinated clinic of Children's Hospital at Stanford and the Children's Health Council.

"Though we all work in different ways, I think social workers all have in common the understanding that if you intervene at a time of crisis in a person's life, whether it's medical or psychological, that's the best time to make a lasting contribution that's going to make the future easier for the person." Wait too long to intervene, and the emotional scars of not getting help when it's needed can be devastating, especially for a child, she said.

Eulau has been teaching the fine arts of psychiatric social work to enthusiastic students and new physicians since 1969 when she joined the Stanford staff. In addition to meeting with individual clients, Eulau teaches courses in family and couples therapy, both at Stanford and at the University of California, Berkeley.

"It's a complicated job, which is why I love it," she said. "There is great satisfaction in getting involved in someone's life at what may be a troubled time, to nurture."

Adolescents are Eulau's special interest. She helped set up a peer counseling program several years ago in the Palo Alto school district in which 50 or 60 junior high and high school students each year are trained to "help other kids" through the normal crises of growing up.

"The purpose of the training is not only to learn to be of service to other people, but in the process, to learn about yourself," Eulau said. In a year-long course, students learn about the stresses that can burden young lives and the community resources that can help alleviate those burdens.

"They learn very carefully what friendship and listening does, when a problem is beyond that, and how to help people get professional help in a way that helps them feel dignified and good about themselves.

"People who do the work that I do have to know themselves pretty well, and this is beginning to help young people realize that to know other people starts with knowing yourself. That's a particular pleasure in my job, and I hope in the people I train, because if you feel like it's an opportunity for you to grow yourself, you don't suffer 'burnout' or get bored or feel like you're doing the 'lady bountiful' thing for anybody. It's a mutual exploration."

Burnout, the emotional exhaustion that can wear down workers in critical care fields, has never been a factor in Eulau's life, she said. "I read a lot about burnout, I hear a lot about it. There are times when I feel incredibly drained, and absolutely need to go and look at the beach or something, where there is nobody around. But on the whole I feel incredibly exhilarated."

Sometimes a client's problems run especially deep, and the healing process is frustratingly slow or stalled completely. Those moments can be rough, Eulau said.

"Over time I've gotten very in touch with my limitations and the limitations of any system or individual to help at certain times," she said.

"That's constantly frustrating and constantly sad. But there's always something more to learn, something more to try. Learning, and being interested in doing a better job next time, helps with the incredible frustrations."

A native of New York City, Eulau first became interested in social work while working her way through Hunter College with a counseling job in a settlement house. After graduation, she chose Smith College's School for Social Work to continue her studies. Last June, the School honored its alumna with the "Day-Garrett Award," given each year to one outstanding leader in the field of social work.

The commendation letter reads, in part:

". . .The testimony given by so many of the people whose lives you have touched and enriched—your students, your teachers, your colleagues in the social work and allied professions, your friends—always echoes the same themes. You are a superb teacher and supervisor, able to articulate your profound understanding of the complexities of human development not only to other social workers, but your wisdom and thoughtfulness is consistently understood and valued by your colleagues in other helping professions. . ."

—Deborah Franklin

National Respiratory Therapy Week

In honor of National Respiratory Therapy Week, Nov. 7-13, Stanford's department will sponsor a week-long exhibit in the corridor outside the main center cafeteria.

Also, an information booth run by respiratory therapists will be set up Nov. 8 and 9 at the same location during the noon hour.

National Respiratory Therapy Week was declared by the U.S. Congress and President Reagan in recognition of respiratory therapy's contribution to health care. Noted Dr. Thomas Raffin, medical director of Stanford's department, "The growth of respiratory therapy since its inception has been exciting and challenging for those working in the field (80,000 jobs directly related). With continued recognition it is hoped they will expand the role they fill and continue to contribute significantly to patient care."

Respiratory therapists, he said, are active in the diagnosis and treatment of pulmonary disease as well as areas such as emergency medical care and research.

The department at SUMC has more than 100 employees. They deliver all of the respiratory care to patients at Stanford University Hospital, including monitoring the "breathing machines" (ventilators) used for patients in the intensive care units.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Biochemical roots of psychosis. . .

continued from page 11

he quickly related it to adrenaline in chemical structure. The compound that Carlsson discovered was dopamine.

"That discovery had implications for a number of different diseases," Barchas explained. "We now know that dopamine is important in Parkinson's disease, a movement disorder.

"It may also be important in some forms of depression. Knowledge about dopamine has led to a whole new way of thinking about schizophrenia, which suggests that a relative excess of dopamine may be involved in schizophrenia or in its treatment.

"That information ties in with other evidence about schizophrenia which suggests that the disorder may have biochemical and genetic aspects."

Barchas described some of the work of the Nancy Pritzker Laboratory in terms of dopamine and mental disorders. Members of the laboratory recently were the first to purify the critical enzyme from brain which controls the formation of dopamine and to determine some of its characteristics, including a marked activation during stress. They believe that increase in enzyme activity is a result of the addition of a phosphate group to the enzyme.

Barchas described two of his collaborations with other faculty. The first is with Dr. Roland Ciaranello, associate professor of psychiatry, with whom it was demonstrated that the amounts of the enzyme are controlled genetically. With Dr. Lawrence Kedes, associate professor of medicine, and postdoctoral fellows in his group, it has been possible to investigate the molecular genetics of the formation of dopamine.

Drs. Barchas, Ciaranello, and Kedes are now involved in a study of the processes regulating the formation of dopamine. The three of them, in association with Berger, expect to extend their studies on patients to determine whether individuals with schizophrenia, depression, autism, or borderline schizophrenia have changes in those genetic mechanisms.

The combination of basic science and an appropriate clinical environment is a critical factor in the effectiveness of the Stanford program, Barchas said.

New medications, Barchas stated, have resulted in a major change in the treatment of those with severe mental illness. In France, he observed, it was discovered almost by chance that a group of drugs called phenothiazines were effective in the treatment of many schizophrenics.

These antipsychotic drugs—such as thorazine, stelazine, melaril—are believed to block the brain's receptors for dopamine, stopping the relative excess of the neurotransmitter.

"They have been miraculous," said Barchas, "because prior to World War II, schizophrenia was a disease which almost inevitably resulted in a very bad outcome. Now an acute schizophrenic taking the medications will usually be markedly improved, and after a while will be finished with the treatment."

But this doesn't apply to all schizophrenia patients. Between 25 to 50 percent of the mentally disturbed patients get no help, or only temporary help in which they are improved but basically are still profoundly disturbed, he said. An analogous situation exists for depression. In both cases marked progress is being made.

Jack Barchas

But Barchas cautioned that such illnesses as schizophrenia and depression may have no single cause. The biochemical approach to finding out their cause is only one avenue. There is the psychological side, with attendant stresses and the psychological meaning of events: the social with family and interactional processes and role theory, as well as hereditary factors.

As part of the discussion of the psychiatry of the future, Barchas emphasized his view that ultimately there would be need for a new approach that would combine the advances in neurobiology with the behavioral approaches.

"We need to understand the ways in which behavior changes biochemistry and how the altered biochemistry in turn affects subsequent behavior," he stated. "Out of these concerns may come a new psychiatry perhaps requiring a different language to express those interrelationships which we can now only glean.

"A powerful early example of the need for multiple approaches is shown in the treatment of schizophrenia," he explained. "We are just learning that the best approach to treatment for many patients involves a combination of psychopharmacology with social and psychological approaches. That combination can be expected to be quite important in the future."

Scientists, Barchas said, are also interested in affective disorders such as mania and depression. His own laboratory, in collaboration with the Stanford Mental Health Clinical Research Center, is searching for biochemical bases of depression which is associated with several important neurotransmitters, such as serotonin and norephinephrine.

The two are distributed in varying concentrations throughout the brain, with the greatest concentration in nerve cells from areas thought to control emotion and mood.

"The most important biochemical theory of depression," said Barchas, "states that it's associated with a deficit in serotonin or norephinephrine at critical synapses, the microscopic gaps between nerves cells."

Barchas said brain chemicals other than serotonin and norephinephrine may also be involved in depression. One group of these, called endorphins, has some actions similar to those of morphine and other opium derivatives.

"Since morphine can cause profound euphoria when injected intravenously and a state of great discomfort during withdrawal, it has been hypothesized that these morphine-like compounds are involved in depression," he said. Two scientists in the Pritzker Laboratory, Drs. Eckard Weber and Chris Evans, have found several new, previously unrecognized forms of endorphins and related substances.

"The finding of such substances is quite exciting," Barchas said. "We are at a phase of neurobiology similar to that of the finding of continents and islands. We know the finding of new neurotransmitters will be important for treatment and diagnosis in the future but do not yet know exactly what their significance will be or in what disorder they will prove important."

"The first demonstration that the endorphin-like substances in brain could be changed by stress was made by Dr. John Madden, then a predoctoral student at Stanford," Barchas said. Madden demonstrated that in certain types of stress the amounts of the endorphin-like materials are increased in the brain. At the same time there is a change in pain threshold. His findings may explain the oft-noted reports of soldiers in battle or of accident victims who suffer an injury but do not feel pain, he added.

In another Stanford study, Madden, now a member a of the Pritzker Laboratory, is working with Dr. Richard Thompson, professor of psychology. They are investigating the role of endorphins in certain types of learning, Barchas said. There is also evidence that endorphins may be important for a model of depression, the type referred to as learned helplessness.

"A great deal of work at Stanford and elsewhere is now underway to determine the role of endorphins in mormal metabolism and in psychiatric disorders," he added.

—Spyros Andreopoulos

Medical Center Calendar

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservation required. Call 497-6389

PUBLIC EVENTS

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

WEDNESDAY, NOVEMBER 3

Dept. of Neurology Grand Rounds: "Digital Subtraction Angiography in Neuroradiology"—Dr. Dieter Enzmann. 5 p.m., C364.

Dept. of Structural Biology: "The Genetics of Myosin Assembly"—Dr. Henry Epstein (Baylor College of Medicine). Noon, Fairchild Bldg., D102.

Div. of Hematology Conference: "The Role of Epstein-Barr Virus (EBV) in Post-Transplant Lymphomas"—Dr. Henry Kaplan. Noon, S102d.

THURSDAY, NOVEMBER 4

Div. of Otolaryngology/Head and Neck Surgery Grand Rounds: "Lines, Angles, and Contours of the Ideal Face"—Drs. Nelson Powell and Brian Humphreys. 6 p.m., Rehabilitation Conference Room, Santa Clara Valley Medical Center.

Dept. of Medicine Grand Rounds: "Septic Shock"—Dr. Gary Schoolnik. 8:30 a.m., Fairchild Auditorium.

Dept. of Biochemistry Seminar: "Regulation of Viral and Cellular Transcription by SV40 T Antigen"—Prof. Robert Tjian (UC Berkeley). Noon, M316.

Dept. of Dermatology: "The Pathophysiology of Psoriasis"—Dr. L. Dubertret (Heri Mondor Hospital, France). 8 a.m., Dermatology Library, R136.

FRIDAY, NOVEMBER 5

Dept. of Dermatology: "The Photobiologic Activity of Furocoumarins"—Dr. L. Dubertret (Heri Mondor Hospital, France). 8 a.m., Dermatology Library, R136.

Dept. of Gynecology and Obstetrics Grand Rounds: "The Last Epidemic"—Physicians for Social Responsibility. 8 a.m., A336.

Child Psychiatry Grand Rounds: "Mothers and Babies—The Origins of Communication"—Dr. Daniel Stern (Cornell). 11 a.m. till 12:15 p.m., Children's Hospital at Stanford, Faber Auditorium.

TUESDAY, NOVEMBER 9

Dept. of Biochemistry Colloquium: "Expression of Genes Introduced into Mice"—Richard Palmiter (Univ. of Washington, Seattle). Noon, M114.

Dept. of Pathology Seminar: "A New Oncogenic Rabbit Virus Causing Immunosuppression"—Dr. David S. Strayer (UCSD). 4:15 p.m., L201.

Dept. of Dermatology Lecture: "Gene Amplification and Drug Resistance"—Dr. Robert Schimke. 10 a.m., Dermatology Library, R136.

Calendar items must be received in the Office of Public Events, 800 Welch Road, Suite 221, by the Wednesday noon seven days prior to the issue in which the activity is first to appear.

Lecture to focus on alcohol abuse

"Alcohol Use and Abuse: The Health and Social Consequences" will be the topic of a public talk 7 p.m., Nov. 8 in the Fairchild Auditorium, by Dr. Michael Jacobson, nationally known consumer advocate.

He will discuss ways for health professionals, community groups and individuals to help combat alcoholism. "Alcohol abuse costs society over $100 billion per year and results in an estimated 200,000 deaths of Americans annually," noted Holly Nickels, R.D., of the Department of Dietetics.

Some of Jacobson's suggestions, she said, include educational efforts, an increase in alcohol taxes, and building of coalitions to put pressure on legislators and the alcohol industry. He is also involved in pressuring the broadcast industry to ban liquor advertising.

Jacobson is executive director of the Center for Science in the Public Interest, a nonprofit organization based in Washington, D.C., active in nutrition education and government policymaking in food and health issues.

Under his direction the Center, along with 16 other health and consumer groups, recently appealed to the liquor industry to print health and safety warnings and ingredients on all alcoholic beverage labels, to contribute funds for public service messages to discourage drinking, and to halt marketing and advertising aimed at children and teenagers.

Jacobson's talk is being sponsored by the SUH Department of Dietetics, San Jose Peninsula Dietetic Association, and the San Mateo County Nutrition Council. Attendance is free of charge..

For further information contact Nickels or Jane Woeckener, at 497-6904.

Senate report

Faculty Senate approves biophysics, neurosciences program

TO MEMBERS OF THE ACADEMIC COUNCIL FIFTEENTH SENATE REPORT NO. 4

Summary of Actions Taken by the Senate on October 28, 1982

At its meeting on 10/28/82, the Senate took a number of actions:

1. The Senate accepted, by unanimous voice vote, the recommendation of the Committee on Graduate Studies (C-GS) that the interdisciplinary program in biophysics be extended, with the understanding that it will be put on a regular review cycle for Senate approval like other interdisciplinary degree programs.

2. The Senate accepted, by unanimous voice vote, the recommendation of the Committee on Graduate Studies (C-GS) that the interdisciplinary program in neurosciences be extended, with the understanding that it will be put on a regular review cycle for Senate approval like other interdisciplinary degree programs.

3. The Senate accepted, by unanimous voice vote, the Annual Report of the Committee on Academic Appraisal and Achievement (C-AAA).

4. After the division from the Annual Report of the Committee on Libraries (C-Lib) of the recommended revision of the University statement on Visiting Scholars (so that the recommendation might be referred to the appropriate administrative officers), the Senate approved, by unanimous voice vote, the Annual Report of the Committee on Libraries (published in *Campus Report* 10/27/82).

MINUTES OF THE FIFTEENTH SENATE OF THE ACADEMIC COUNCIL OCTOBER 28, 1982

(Draft Subject to approval by the Senate on November 11, 1982)

A meeting of the Fifteenth Senate of the Academic Council was held on 10/28/82, beginning at 3:17 p.m. in Room 180 of the School of Law, with Chairman A.L. Fetter presiding. Present were 28 Representatives, 6 *ex officio* members, and a number of invited guests.

Approval of Minutes

The minutes of the meeting of the Fifteenth Senate held on 10/14/82, were approved as submitted in writing.

Report of Steering Committee

In the Report of the Steering Committee, Chairman Fetter thanked all those who came on time so that the meeting could begin promptly. He called attention to the one new item added to the forthcoming agenda items, the report of the subcommittee of C-AAA on the Evaluation and Improvement of Teaching (C-AAA-EIT). He also announced the resignation of Professor J.A. Spudich (structural biology) from the Senate and his replacement by Professor L.T. Rosenberg (medical microbiology) beginning with the next Senate meeting.

Report of the President

In his report, President Kennedy spoke briefly on two matters:

Concerning the administration's response to the recommendations of the *Ad Hoc* Committee for TIAA-CREF Alternatives, which reported last May, President Kennedy indicated that Jeannie Thomas, manager of benefits/records, had conferred with the Scott committee on its several recommendations. She was asked to give highest priority to the recommendation that Stanford add three or four investment alternatives to the one presently available. She had estimated last June that the earliest possible date for those recommendations would be in 1983 and probably not at the beginning of the year. The process of choosing appropriate alternatives is complex and time-consuming. She is reporting regularly to the Committee on Faculty and Staff Benefits, so there is an opportunity for faculty input on the choices to be recommended. Once this highest priority recommendation of the Scott committee has been implemented in 1983, the administration will address the other recommendations made by that committee.

The second matter President Kennedy commented on was the deep impact of indirect costs on the budget difficulties anticipated at Stanford over the next two or three years. Research volume and the rates of recovery of indirect costs are currently the largest and most volatile items in our income picture. These are also controversial political issues in the federal government right now. The NIH attempt to reduce indirect cost reimbursements unilaterally this year has been temporarily resolved, but the issue of indirect cost recovery rates remains controversial both here on the campus and in Washington, where attempts are underway to establish a single set of rules across the government.

Stanford administrators are anxious to promote thorough consultation with Principal Investigators. The Dean of Research will establish a group of PIs to collaborate with him in formulating policy directions. There will be a Senate presentation in December on this problem, with follow-up discussions after that. It is a very serious problem. Faculty members are urged to make an effort to understand the complexities and magnitude of the problem, and the administration intends to provide whatever forums may be necessary to achieve that end.

In response to the president's comments on retirement investment alternatives, the hope was expressed that the University would provide at least one alternative that does not pay out differentially to men and women.

Report of the Provost

In the absence of Provost Hastorf, Vice-Provost Bacchetti made a brief report on budget concerns. He cited the publication of lead stories in the 10/27/82 issues of *Campus Report* and the *Daily* which gave a true picture of the University's budget outlook. The Provost will bring the Long Range Forecast before the Senate for discussion on 11/11/82. This report will deal with where we are financially, what factors appear to be causal, and what processes will be put in place to deal with both the short and long range budget problems.

The dominant precipitating factor is the slackening of the rate of increase in research volume. Instead of growing at about the rate of inflation, as expected in 1981-82, the rate of increase in research volume flattened out, and the result has been a decrease in indirect cost recovery to the Operating Budget. Certain fixed indirect costs, e.g., maintenance costs of research space in offices and laboratories, do not decline because the rate of research volume growth slows. This creates a gap between income and expense.

One approach to the problem will be to assess the consequences of pushing for greater income growth and less expense growth. If that doesn't solve the problem, it will be necessary to reduce the budget base to a level suitable for the income we can reasonably expect. This process will probably take three years.

In the discussion following these two administrative reports on the budget and the indirect cost recovery problem, Professor A.E. Siegman suggested that a single set of rules across the University on indirect cost assessments might be just as valid as a single set of rules across the government. A system of explicit indirect cost assessment and funding could be devised to apply to all the activities in the University, so that every expenditure by everyone in the University would either be overhead or would bear overhead. Professor Siegman expects to formulate such a proposal in the near future, and offered to share it with anyone interested in the idea.

The question of incentives for increasing research volume was also raised, with the assertion that there were many disincentives but no apparent University-sponsored incentives.

President Kennedy responded that the administration is anxious to increase research volume for various reasons, not least because it increases the creative/productive dimension of the faculty. Presently, both faculty desire to implement good ideas and School or department motivation to share salary obligations with sponsors of research provide incentives to increase the sponsored research volume. Even so, many faculty members feel that competing for outside funds is unseemly and that the risks are too great, or that their preferred research directions would have to become less venturesome to be more attractive to sponsors. Providing appropriate incentive structure is a complicated matter which ought to be explored thoroughly before we decide that we must go all out to push for increased research volume.

At the close of this discussion, the Dean of Humanities and Sciences urged the group studying the indirect cost problem at Stanford to establish contact with other Principal Investigators and Washington agencies to get a better reading on the mixed signals presently being reported by some. If the problem is a temporary one and more funding will be made available than can be promised at present, it's important to learn that now before cutting back on academic programs.

Report of the Committee on Graduate Studies (C-GS)

Program reviews of the graduate interdisciplinary programs in biophysics and neurosciences were presented by the Committee on Graduate Studies for Senate approval.

The biophysics review was presented by Professor William Little, Chairman of the Review Committee. He reviewed the procedures followed in conducting the review, summarized the strengths of the program, and commented on the only reservation expressed about the program: that there was some lack of communication and interaction among the students, who were based in different departmental research groups. This fault has already been somewhat alleviated by instituting a research seminar which brings the students together regularly. A more serious problem is the lack of University funds for program support.

In the absence of Professor Kallman, Chairman of the Neurosciences Review Committee, the chairman of the Committee on Graduate Studies presented the report and opened the discussion.

In the discussion of the reports, the observation was made that these graduate interdisciplinary programs all seem to share the same problems: they are small; students are based in the several cooperating departments and have limited opportunities to interact with their peers in the program; the programs all lack funding from University sources. This raises the question of whether or not there is justification for the continuation of such programs. Why can't these programs of study be accommodated within established departments?

Several responded that many of the very best students are attracted to Stanford because of the existence of these graduate and undergraduate interdisciplinary programs, and would be lost to the University if these options weren't available. It was also pointed out that the ranges of department and interdisciplinary degree requirements are frequently incompatible.

In addition, interdisciplinary programs exert a positive influence in bringing faculty together across disciplines, in synergizing research, and in fostering new permutations of scholarship. Student interest, faculty interest, and outside needs all combine to promote these interdisciplinary programs.

The Dean of Graduate Studies commented that the possibility of moving these programs into departments, if at all feasible, is a perennial consideration for all graduate interdisciplinary programs. (One of these programs is considering such a move at the present time.) If nothing else, such a move would provide a program with a more traditional channel for academic program funding.

Responding to a question about when the faculty Senate considers the problem of funding for such programs (while they are considering the approval of a program or after it has been approved), President Kennedy made it clear that the Senate has no power to appropriate funds. It is the administration's responsibility to do its best to help academic programs mandated by the Senate, either by assisting them to find outside funding or by providing University funds if necessary. There is always the possibility that a program may be mandated by the Senate which cannot be funded because the money isn't available. In such a circumstance, it is the duty of the administration to report that fact to the Senate.

As the discussion continued, there was further support expressed for the view that there is excessive fragmentation and narrowing of graduate disciplines. The observation was made that both a new interdisciplinary program and the department that spawned it might well be richer if the new field weren't cut adrift. There is much to be said for encouraging a department to grow and to accommodate new developments, for expecting it to make bridges and to allow for new paradigms.

It was pointed out also that the question of narrowness of focus is appropriate to ask of undergraduate as well as graduate programs, and that the issue will no doubt arise again when the undergraduate interdepartmental programs are reviewed later this year.

Following the discussion prompted by these two program reviews, the Senate, by unanimous voice vote, accepted the recommendation of the Committee on Graduate Studies that the programs in biophysics and neurosciences be extended, with the understanding that they will be put on a regular review cycle for Senate approval like other interdisciplinary degree programs.

Annual Report of the Committee on Academic Appraisal and Achievement (C-AAA)

Professor M. Sunseri, Chairman of the 1981-82 C-AAA,

continued on next page

Senate/ continued from page 14

presented the Annual Report. She called attention to the work done by C-AAA-EIT in developing student and faculty questionnaires concerning the teaching evaluation system now in use at Stanford, and indicated that data processing and the preparation of the subcommittee report are currently in progress. She also called attention to the report of the Rhodes-Marshall subcommittee and to the report appendices on the implementation of the Revised Pass/NC Policy by the Registrar.

Professor S. Matisoff, the 1982-83 Chairman of C-AAA, remarked that the C-AAA-EIT report would be presented to the Senate by early spring and is expected to generate a great deal of interchange.

In the discussion which followed this report, the comment was made that the Pass/NC Policy revision appears to be a complicated and expensive procedure with very limited benefits. If the Senate assessed indirect costs, to such a policy revision so that its members could know the real costs the Senate might react differently to such a proposal.

The Registrar reported that, while costs thus far had been somewhat lower than the original cost estimates put before the Senate last year, it is true that the policy change has not been cost-free. So far, students seem to be understanding and complying with the system, but the real test will come with the autumn end-quarter reports. It is expected that C-AAA will report these results to the Senate.

The Senate was reminded that, since one motivation for instituting this policy was to restore the legitimacy of the Pass grade in a course, it would be premature to say now that the costs of the policy change bring very limited returns.

At the close of this discussion, the Annual Report of C-AAA for 1981-82 was accepted unanimously by voice vote.

Annual Report of the Committee on Libraries (C-Lib)

Professor M.H. Jameson, Chairman of the 1981-82 Committee on Libraries, presented the Annual Report, calling attention to the need for regular and continuing communication with the President of the Research Libraries Group (RLG) and reiterating the C-Lib's conviction that, despite the growing pains, a network such as the Research Libraries Information Network (RLIN) is necessary and desirable.

He introduced Senate guest Patricia Battin, Director of Libraries at Columbia University and currently Acting President of RLG.

Dr. Battin reported that RLIN has achieved a good deal more stability in the system since May and has experienced very good service, with increased capacity, for the past five months. Generally, improvements have been more beneficial than had been projected for this period. It may be possible by December to remove some of the present restrictions on Stanford's public service terminals. New software modifications may also soon permit searching at Stanford during the evening hours, alleviating a penalty Stanford has suffered because of being at the western end of the time zone.

There was also remarkable improvement across the networks with the new Interlibrary Loan System, instituted in September; 16 libraries delivered materials in nine days or less.

At present, the system is 75 percent finished with an inventory of all holdings, including Library of Congress holdings. That information is expected to be on-line in November. Dr. Battin concluded by welcoming suggestions for improving the system and by urging scholars to become involved in the work of RLIN and the RLG.

President Kennedy expressed the gratitude of Stanford and the other RLG institutions to Dr. Battin for serving in the Presidency of RLG during a difficult period and with such conspicuous success.

In the discussion following the report, the C-Lib was asked where Stanford stands on getting the complete library on the computer and eliminating the card catalog. Associate Director Dale Canelas, University Libraries, responded that the question asked was a complicated one. The data presently in the RLIN system is, to a certain extent, an on-line catalog. The type of system referred to at the University of Illinois is an on-line catalog plus an on-line circulation system. Our best estimate is that adding the latter at Stanford would cost at least a million dollars. Then there would be the problems of linking the on-line data in RLIN with the on-line circulation system, and of retrospectively converting all the data in the card catalog into an on-line format. That is all time-consuming and labor-intensive, and beyond Stanford's financial resources at this time.

There are devices under development now to assist in the retrospective conversion of catalog data from card format to on-line format. Within five to ten years, when such devices become available, retrospective conversion of card catalogs may become economically feasible.

Automated circulation systems have obvious advantages, particularly for those who work in interdisciplinary programs and use branch libraries within the Stanford system. The Library looks forward to moving gradually toward such automation as soon as can reasonably be expected.

The question was raised whether or not the branch libraries should have sole copies or only duplicate copies of books available in the main library.

Associate Director Canelas responded that the library system has neither the budget nor the space to duplicate the holdings in the research branch libraries (Art, Cubberley, Music, and the Science libraries). Some years ago, the Senate decided that Stanford wanted to foster the branch library system. Now nearly a million dollars a year is spent on acquisitions for those research branches. They are stable and have good hours; there shouldn't be undue problems with using them.

There are other branch libraries called "working branch libraries" (e.g., Tanner Philosophy Library, Communication Library, Psychology Library, etc.). These are essentially duplicate collections, largely purchased by main library funds and cross-cataloged in the main library card system. However, during the mid-70s budget retrenchment period, funding was withdrawn from these working branch libraries because they were largely duplicate collections of books in Green Library. The policy now is that every item in the working branch libraries is or should be duplicated in Green. The research libraries, however, are research collections and they hold unique items.

In returning to the subject of an automated search and circulation system, Dr. Battin pointed out that the truncated Illinois system, while impressive as a short-term solution, has fundamental limitations which would be unacceptable for many aspects of scholarly research. For example, it permits no search by subject, but demands the name of an author, a specific title, or a catalog number for call-up.

She added that it is important to distinguish between the circulation capacity and the on-line catalog capacity of a system. The research libraries have started with the latter because if the on-line catalog is limited to only those books which circulate, the result in the long run is a restricted capacity for bibliographic search.

The Associate Director of University Libraries was asked about the different security systems presently in force in Meyer and Green Libraries. Director Canelas responded that the libraries started investing in electronic security systems several years ago, first for the Engineering Library, then for Meyer, and more recently for Cubberley. Eventually, all the libraries will adopt the system. It has already reduced loss for the Engineering Library and is expected to do so for the others as well.

To the question of whether an automated circulation system would produce significant savings to offset the heavy costs, the response was that the savings would be miniscule in relationship to the costs.

At the close of the discussion, Chairman Fetter announced that the vote on the acceptance of the Annual Report of C-Lib would be taken on only the body of the report, excluding the two-page Appendix on a recommended revision of the University statement on Visiting Scholars. This latter is being referred, not to C-AAA as stated in the report, but to the appropriate administrative officers (the Vice-Provost for Research and the Associate Provost and Registrar). It is not properly a matter for Senate action.

The Senate, on a unanimous voice vote, accepted the body of the Annual Report of C-Lib for 1981-82.

The meeting adjourned at approximately 4:50 p.m.

Academic Secretary

University officers plan presentation on budget outlook at Senate Nov. 11

continued from page 1

research volume in nominal dollars," Budget Director Raymond Bacchetti told the Senate.

While some indirect costs vary directly with research volume, Bacchetti said, "a substantial fraction of indirect cost recovery is predicated on the sharing of fixed—or relatively fixed—costs proportionately between instruction and research.

"Office and laboratory space seldom is released because the rate of research. . .growth slows. Yet the cost of providing utilities and maintenance services to that space does not slack off. . . .

"The University's operating budget is sized to support a certain mix of instruction and research. A drop in income seldom produces an equivalent decline in expense."

As a result, "a tough-minded look" at the principal income and expense elements will be needed, he said. "The way things look now, we'll have to make budget reductions over the next three years to realign expense with income."

Last spring, the University trimmed one percent of its budget base for the current fiscal year. Now an additional $1 million will be sought in expenditure holdbacks, deliberate underspending by departments this year. The facilities reserve, which helps fund renovation, remodeling and construction of some new buildings, also will be reduced.

University officers already have planned an extensive presentation on the fiscal outlook at the next regular Senate meeting Nov. 11.

Prof. Anthony Siegman, electrical engineering, director of the Ginzton Laboratory, said it would help to have "a single set of rules across the University" so that indirect costs associated with non-sponsored projects could be "explicitly assessed and funded." All expenditures then could "either be overhead or bear overhead," he said.

Prof. Robert White, chairman of electrical engineering and professor of materials science, suggested increasing faculty incentives for higher research volume. "I can think of none now. There's an enormous category of disincentives," he added.

Kennedy replied that the University is "obviously anxious" to increase research volume, "not least because that makes the faculty more productive. . .the things we live for around here is to improve the productive and creative dimension of the University.

"It's not exactly true there are no incentives in place to do that. The largest one is the faculty's desire to get all the ideas they have going in the laboratories and the library. . . There is an automatic incentive of that sort to increase research volume."

In some schools, including engineering, there are existing incentives "of a crasser sort," the sharing of faculty salary obligations with research sponsors."

But Kennedy cautioned that "not every incentive is a simple issue.

"Raising 'offset' contributions to salaries from research grants does provide incentives of a sort to send faculty members scrambling for outside money but (some) feel it is an unseemly scramble that risks too much—that the faculty must then concentrate too much on safe and saleable projects as opposed to more venturesome ones.

"In our judgment, the incentive structure is a very complicated surface, one we ought to map very carefully before simply deciding that the right thing to do is push all the levers that increase incentives for (higher) research volume."

Humanities and Sciences Dean Norman Wessells said administrators should contact faculty who serve as principal investigators in research to get a better reading on the "mixed signals" from Washington on the research funding outlook.

There may be "more funding in the offing than is apparent now," he said. "It would be very bad to cut back academic programs significantly if in fact we are in a temporary situation."

Stanford West...

continued from page 1

"Third, the project is in partial response to the voices we heard for so many years urging Stanford to provide more housing for its employees so that the jobs-housing imbalance and the commute traffic in Palo Alto would be reduced."

Williams said that the University will continue to work closely with the city to bring about housing that meets the needs of both Palo Alto and the University.

The process began more than a year ago, he said, when Stanford sponsored a series of four public meetings with Palo Alto and Menlo Park neighbors to hear their ideas about the project before design was undertaken.

Wednesday's meeting will begin at 7:30 p.m. in Palo Alto City Chambers, 250 Hamilton Avenue.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Nonexempt

30975-PM (JCC:1771) LIBRARY SPEC IV: Responsible for the day-to-day mgmt of the technical processing activities & for the suprv of 3.5 FTE Lib Specialists staff performing processing activities; respon for communicating needs for change or improvements to federal librarian for discussion & evaluation; respon for providing a minimum of 5 hours per week of reference asst for members of the Stanford Community & general public using manual printed & on-line reference tools for the four Government documents collection; other duties assigned; QUALIFICATIONS: Broad knowl of technical processing & demonstrated competence in cataloging & bibliographic searching; exp in suprv a work group; ability to communicate in clear & concise manner, orally & written; work indep'ly; exp using lib automated systems;RLIN preferred send appl/resume to Bob Johnson, Green Library, Room 223 (497-3152). ;; B16; $1593-1671.

31500-BP (JCC:2454) OFFICE ASST II: A member of staff respon for the maint of the Alumni & Special Interest Volunteer Files; files must be comprehensive, complete & accurate; will perform the following duties: code various SIV & Alumni transactions on coding sheets in a legible manner; file info cards alphabetically; review various source mat'ls for update info; answer inquires from Univ offices, alumni & friends regarding info contained in file; interpret Univ policy relative to the cofidentiality of info contained in file; QUALIFICATIONS: typ 50 or willingness to learn; neat & legible handwriting; ability to work under pressure of tight deadlines; ability to organize own work & set priorities; handle detail work accurately; knowl of the English alphabet; knowl of basic offc procedures; willingness to interchange job duties; send appl/resume to Liz Trujillo, 301 Encina Hall, Stanford, CA 94305.; B09; $565-595.

25871-PM (JCC:2470) OFFICE ASST IV: The Law Placement Recruitment Coordinator works independently with a minimum of supervision under the Placement Director; oversees all aspects of the employer recruitment process at Law School incl primary contact w/ employers, publication of recruiting materials, orientation of students to interviewing program; interacts w/ legal employers; interprets recruiting guidelines; etc.; QUALIFICATIONS: type 50; work well with people; supvr of clerical admin exper helpful; excellent written & oral skills; work under pressure and set own priorities during peak periods; exp with CRT or willing to learn WYLBUR; send application to Dena Landsman, Rm 113, Crown Quad.; B14; $1440-1514.

36141-BP (JCC:2470) OFFICE ASST IV: Help devl, organize, publicize & evaluate a variety of educ'l, social & cultural programs; asst in developing & conducting evaluations of progs; asst in neighborhood coord selection process; asst in planning & implementing the orientation for new residents; implement workshops/info sessions on programs organz; serve as liaison with other Univ offices; devel bochures & arrange layout/mat'ls for printing; prov organz'l help & clerical support for village programs; etc. QUALIFICATIONS: Typ 45; successful exp in developing & implementing programs, initiating projs, wrkg w/ groups of college students & faculty of all ethnic backgrounds, exercise good judgement, taking directions & wrkg indep'tly, wrkg under pressure, organz tasks, attending to detail, effective communication orally & written; send appl/resume to Patricia Brandt, Escondido Vlg. Office,; B14; $1440-1514.

28541-BP (JCC:2512) OFFICE ASST III-SPEC: Full range of office support; suprv half-time asst; type mathematical technical papers; skill in library research techniques; ability to learn word processing system & handle routine correspondence; order office and lab supplies; answer phones & escort visitors; keep monthly account of budgets & prepare graphs & statements; filing; library research as required; xeroxing, etc; QUALIFICATIONS: Type 60-70; fast, accurate 1 typist with excellent typing and grammer abilities; ability to type mathematical technical papers; skill in library research techniques. send appl/resume to Beverly yates, AEL 107, Stanford, CA 94305.; B12; $1310-1373.

24764-PM (JCC:2562) SECRETARY III: Sec for 4 faculty members plus sec/coord for dept's grad student & medical student teaching program; organize & typ all handouts & exams for dept courses; maint file of all course handouts, grades, correspondence, etc for the academic@ year; update publications each quarter or year as needed such as time schedules, courses & degree books, etc; coord weekly seminar program w/ guest lecturers & respon faculty member; ast as primary source of info & advise grad students regarding Univ & Dept requirements, deadlines, etc for application process; sec'l responsibilities, etc; QUALIFICATIONS: Typ 55-60; must be well organized; ability to handle a job w/ diverse duties and responsibilities; must work independently w/ minimum supervision; prev exec or med exp; med terminology strongly desired; knowl of grant budgets desired; send appl/resume to Pat Gonzales, R-356, Medical Center.; B14; $1440-1514.

30455-BP (JCC:2596) SECY II-SPEC: 50% time; 1-5 pm; typing correspondence; technical typing of manuscripts for publications, classwork, typing, & technical reports; preparation of university forms; normal sec'l duties, answering phones, filing, opening mail, forwarding mail, etc; willing to learn word processing; QUALIFICATIONS: Typ 60; technical typing exp preferred; knowl of university helpful; accurate typing; send appl/resume to Rose Aleman, Dept. of Physics.; B12; $655-687.

Exempt

36544-DS (JCC:2228) FINANCIAL MGR II' Asst. Controller/Control & Reporting of Expenditures; full mgmt responsibilities for developing, interpretation & application of Univ. policy expenditure sections of Controller's Offc.; reports to Dir of Acctg; develops systematic procedures which ensure that Univ resources are expended in accordance with constraints placed on them by their sources & in accordance with Univ policy; develops long term operational goals & organz priorties & operating procedures to achieve goals; etc; QUALIFICATIONS: MBA or equivl exp; CPA preferred; 7 or more yrs successful exp in acctg mgmt in a large complex organz; knowl of fund acctg & grant/contract admin; demonstrated ability in design & operation of computerized acctg system; mgmt abiltyto maximize productivity of human resources; superior interpersonal skills including verbal & written communication; able to interact effectively w/ all levels of mgmt & operations.; C10; $3494-4255.

36304-FM (JCC:8880) Misc Professional: Data Processing Coordinator will maint existing database on externally funded research/instruction projects; participate in design of new office-wide processing & reporting sys; have respons for prepara of all user documentation & user manuals for new system; share responsibilities for training all offc staff to use new system; oversee maint of info library; QUALIFICATIONS: ability to function independently w/minimal supvn in all aspects of job; extremely effective interpersonal skills, as well as written, analytic & quantitative abilities typically associated w/BA in English or math; demonstrated training skills; knowl of computer applications & familiarity w/computer languages & research environment helpful; C05; $1670-2086

36287-JB (JCC:6306) R & D ENGR II: Work closely w/ scientists to develop conceptual designs for precision optical/mechanical resrh instrumentation for use in synchrontron radiation beam lines & then calculate temperature distributions & thermal & mechanical stresses & accompanying deformations of metal surfaces & optical components heated by intense x-ray beams; will also expedite procurement & fabrication of new equip as needed; perform mechanical engrg analysis of proposed future designs of synchrontron radiation sources, beam lines, windows, monochromators & related instrumentation, in support of proposals for future facilities; QUALIFICATIONS: M.S. or Ph.D in Mech Engrg w/ ability to perform complex heat transfer & material stress calculations essential; wrkg familiarity w/ computer solutions of such problems highly desirable; ability to read & interpret engrg drawings; familiarity w/ machine shop & fabrication techniques essential;; C99; $2113-2724.

Hospital

Submit applications to the Hospital Personnel Department, 770 Welch Road, or call 497-6361.

Life Sci Res Asst II: Fixed term, 3-4 mos from hire date; perform protein separation w/one & two dimensional gel electrophoresis; ammonium sulfate precipitation & column purification of monoclonal antibodies; make fab, fragments of antibodies; QUALIFICATIONS: BS degree w/emphasis on chemistry; min 1 yr lab work exp; ability to work independently; send appl/resume to Vera Morhenn, M.D., SU Med Ctr, Dermatology Dept, R110 or call 497-5476 or 497-7193

SLAC

95041-JM (JCC:5284) COMPUTER OPR TRNEE: TMS Unit; rotating shift; 15 month training program; operate peripheral units such as tape drives, disk drives, card readers, printers; monitor & report equipment malfunctions & output errors; fulfill administrative requirements; high school or equivl; some exp in computer facility working in dispatch, disk, tape area; must know how to clean equipment, change printer ribbons/paper; good reading, oral & arithmetic skills.; A00; $1300. APPLY AT SLAC

95038-JM (JCC:5284) COMPUTER OPR TRNEE: TMS Unit; rotating shift; 15 month training program; operate peripheral units such as tape drives, disk drives, card readers, printers; monitor & report equipment malfunctions & output errors; fulfill administrative requirements; high school or equivl; some exp in computer facility working in dispatch, disk, tape area; must know how to clean equipment, change printer ribbons/paper; good reading, oral & arithmetic skills.; A00; $1300. APPLY AT SLAC

95050-JM (JCC:6704) S&E TECH SUPVR: Supervise & coordinate activities during fabrication, assembly & testing of accelerator & storage ring ultra high vacuum (UHV) chambers; responsible for planning & scheduling blocks of work; supervise technicians; provide technical assistance to developing design concepts & solving problems; must have thorough knowl of vacuum sci & technology; exp supervising crews of technicians & coordinating fabrication efforts for large projects in accelerator & storage ring science field; ability to read, understand & make engineering drawings & design components or tools; understand welding procedures; familiar with machine shop practices; have strong mathematical skills.; S17; $2416-3030. APPLY AT SLAC.

91592-JM (JCC:6406) SCI & ENGR ASSOC I: Plan, organize & direct activities of electronic technicians in performing preventative & corrective maintenance on systems & equipment; supervise installation, checkout & evaluation of new systems & equipment; pursue & identify problems areas; maintain close liaison with other groups; AA degree in electronics or equival; several years of electronic maint exp desirable; must be thoroughly familiar with high power modulators; regulated power supplies amplifiers; pulse circuitry; protection system & high density solid state analog & digital devices; basic working knowl of microwave techniques, transmission lines, beam dynamics & vacuum systems essential.; C99; $0-0. APPLY AT SLAC

Bargaining unit

29097-TC (JCC:5644) LIFE SCI TECH II: TMS Unit; prep cell preparations, carry out experiments on membranes under supvn & analyse data; perform routine tissue culture work (maintenance of stock cultures, grow suspension cultures & batch cultures attached to growth surfaces) asst investigators in variety of experimental techs related to biochemistry & 1 biophysics of cellular membranes; prep graphs & analyse data; QUALIFICATIONS: degree in Biochemistry or related science or equiv exp; some exp w/ computer desirable.; A24; $8.65.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, November 9, Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Rental housing

HOUSING AVAILABLE

□ **June 14, '83 to Aug. 29, '83:** Atherton, 5BR/3½BA fully furn. hse. Completely remodelled. Pool. $9000/10 wks. Incl. util., maid serv. twice wkly, gardener. Call (415) 321-4100.

□ **Beg. Nov. 1, '82:** Unfurn. hse, 4BR/2BA, newly redec., W/D. Nr. midtwn in P.A., nice family nghbrhd. 1 yr. lese. $1100/mo. Call (415) 329-0797.

□ **Beg. Nov. 1, '82:** Lge studio, furn. sep. entr. Dinette/ktchn, stor. wall, combo stove, frig, sink. Waterbed, carpet. 20 min. bike to campus. Share W/D & solar heat. Pool. $350/mo. + dep. Call (415) 364-5383, after 5 p.m.

□ **Now thru June, '83:** Sublet, Los Altos, 3BR/2BA, 2 frpl., lrg. priv. yd. $1000/mo. Call (415) 969-0613 (eves).

□ **Now:** Alpine Meadows, Tahoe. Nice cabin, 3BR/1½BA, W/D, phone, frpl, sleeps 10. $200/wknd, $70/wknight. Call 493-4139 (eve).

□ **April to July, '83:** Furn. campus hse., 3BR/2BA, study. Fenced yd. $900/mo. incl. grdnr & hsecleaning. Call 858-2142 (eve. & wknd).

□ **Jan. '82 for 3, 6, or 9 mo:** Fully furn. hse 2-3BR/2BA. Lovely Japanese grdn. 20 min. drive to campus. $1000/mo. incl. grdnr. Call 497-1316 or 497-1527 (day), or (408) 245-3780 (eve).

□ **Regularly Avail:** 1 & 2 BR furn. & unfurn. apts. & twnhses & 3BR/2BA hses in Palo Alto & Menlo Pk. in good nghbrhds, close to campus. $525 to $800/mo. Call Shirley, (415) 493-2321 or Jane, (415) 968-4957.

□ **Now thru June '83:** Menlo Pk, unfurn. hse. 3BR/2BA, FR, frpl, patio, beautiful encl. garden. Stove, new frig & W/D. Children welcome, pets ok. 10 min. to campus. $1100/mo. + util. Call 497-2635 (day), 325-5482 (eve).

□ **Jan. to June, '83 (flex):** Furn. campus hse. 4BR/3BA, LR, DR, FR w/frpl. Shop, carport. Auto. sprinklers. Nonsmokers. $1400/mo. + elec., gas, gardning; 1st & last mo. plus dep. Call 857-9185 or 497-1663 (day).

□ **Nov. 15 to June '83:** Spacious Mt. View. unfurn. condo. 2BR/2BA, overlooking pond. AEK, W/D, gar., pool, tennis. $725/mo. lease. Call John, 962-8473 (eve).

HOUSING NEEDED

□ **Jan. to Mar. '83:** Retired Conn. cpl visit. their S.U. fam. seek 2BR hse or apt on campus, Coll. Terr., Evergreen Pk. Frpl. pref. Will hsesit or pay reasonable rent. Call Marilyn Davidson, 857-0390.

□ **Beg. Oct. '82 to March '83:** Want to rent 2BR or more, furn. condo. or hse. Please call COLLECT (714) 752-7870.

□ **Jan. '83 to Aug. '83:** Visit. Prof., wife & 2 children (11, 8) seek 2-3BR furn. hse or apt. nr good public schls. Easy commute to Stanf. WILL SWAP 3BR/2BA hse on 2 acres, 10 min. to U. Mass, Amherst, 1 hr. to Vermont ski slopes, 1½ hr. to Boston. Call COLLECT John Collura, (413) 253-3287.

□ **Winter Qtr:** Visit. Prof. seeks furn. studio or 1BR apt within 3 mi. of campus. If poss. could hsesit. Call Elissa, 497-4977 (day).

□ **Jan. to Mar. '83:** Retired cpl. seeks furn. 1 or 2BR apt., condo, or hse. on campus, Palo Alto, Menlo Pk. Close to shops, campus. Pkg. deal to include car best. Call Dave Marimont, 497-3796 (day) or 325-7182 (eve).

□ **Beg. mid-Nov. for 6 mos. (flex):** Visit. prof., wife seek 1 or 2BR furn. apt. (linens & dishes pref.). Write to Y. Ilamed, Math Dept, Stanford 94305.

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

Lively Arts to present Stoltzman-Trampler- Luvisi Trio

The Lively Arts at Stanford will present the Stoltzman-Trampler-Luvisi Trio, with clarinetist Richard Stoltzman, violist Walter Trampler, and pianist Lee Luvisi, at 8 p.m., Wednesday, Nov. 10, in Dinkelspiel Auditorium.

The Trio will play Mozart's "Trio in E flat Major K. 498;" Shostakovich's "Sonata for viola and piano, Op. 147;" Brahms' "Sonata in E flat Major for clarinet and piano, Op. 120, No. 2;" and selections from Bruch's "Eight Pieces, Op. 83."

The Trio came together as an ensemble in 1980, playing their New York debut in the New School Concert series, which has also introduced the Guarneri, Cleveland, and Vermeer Quartets, and TASHI. The special rapport evident among the three musicians has led to critical praise wherever they have performed.

Stoltzman is currently regarded as one of the finest clarinetists in the classical repertoire. He has performed as a soloist with many orchestras, including recent sold-out performances with the Mostly Mozart Festival Orchestra at Kennedy Center and Lincoln Center.

In addition, he performs often with William Douglas and TASHI, of which he is a founding member, and has recorded for RCA, Desmar, and Orion records. Stoltzman was also the first clarinetist ever to be heard in recital at Carnegie Hall.

Trampler, viola, has performed as a soloist with orchestras as a recitalist and with chamber music ensembles throughout the world. At age 17, he toured Europe as violist of the Strub Quartet. One year later he was appointed principal violist of the Berlin Radio Symphony.

He came to America at the outbreak of World War II, and was soon engaged at the newly-formed summer music festival at Tanglewood, an involvement which led to a position with the Boston Symphony Orchestra under Serge Koussevitsky. Several years later, he became a founding member of the New Music Quartet, dedicated to the performance of contemporary music.

Pianist Luvisi studied with Rudolf Serkin and Mieczyslaw Horszowski at the Curtis Institute of Music where, upon his graduation, he became the youngest faculty member in the history of that institution. In 1963 he returned to Louisville, Ky., his birthplace, as artist-in-residence at the University of Louisville School of Music, where he is now also professor and head of the Piano Department.

Luvisi's solo activities have included recital and orchestral engagements across the U.S., Canada, Mexico, and Europe.

He is a frequent guest artist with the Chamber Music Society of Lincoln Center, and at New York's Mostly Mozart Festival and Chamber Music at the "Y" series. A participant for many years at the Marlboro Music Festival, he has spent the past 10 summers as an artist-faculty member of the Aspen Music Festival.

For ticket information call Tresidder ticket office, 497-4317.

Fritz Brun as Shu Fu the barber, Johanna Dickey as Shen Teh, 'the angel of the slums,' and Rush Rehm as Yang Sun, an unemployed pilot, in a scene from the Stanford Drama Department's production of Bertolt Brecht's parable play, *The Good Soul of Setzuan*, opening at 8 p.m. Tuesday, Nov. 9, in the Little Theater. Directed by Deoffrey Reeves, performances continue through Saturday, Nov. 13. Tickets at $4 (students and seniors $2) are available at Tresidder Ticket Office.

University defends DNA patent...

continued from page 1

contend that sufficient information was provided in the application to enable scientists to perform the basic genetic engineering process.

"The numerous publications subsequent to the filing of the subject application support the fact that by following the teachings of the subject application one can prepare functional plasmids and clone foreign DNA," stated Bertram I. Rowland, of Townsend and Townsend attorneys of San Francisco, which prepared the amendment.

In addition, Cohen and Boyer had made the plasmid in question available to researchers, enabling them to apply the technique without regard to the description of the plasmid.

In addition to Cohen, Boyer and Weisblum, other declarations were offered in the case about the enabling issue by Stanley Falkow, chairman of the Medical Microbiology Department at Stanford; David Hogness, professor of biochemistry at Stanford; and David Helinski, professor of biology at the University of California San Diego.

The amendment also addressed what Rowland called the "Darwinian" rejection. This was raised by the Patent office, which noted that a DNA process analogous to the one described in the patent can occur in nature under special circumstances.

"Based on the frequency of mutation and selection of individual species, the evolutionary process is statistically unlikely to have occurred in the time span which was available." The amendment continued by noting that "an evolutionary time scale of hundreds of thousands of years and not the lifetime of a patent" is not relevant to consideration of the application.

"The next objection," read the attorney's remarks, "concerns the question of whether Professor Robert Helling of the University of Michigan is a coinventor. Helling has declined to sign a disclaimer of co-inventorship. He also has declined to respond to queries from Rowland about what role he played in the invention, the document said. Although Helling had co-authored a journal article with Boyer and Cohen, "the doctrine that co-authorship is prima facie evidence of coinventorship has always been considered by this attorney to be mischievous," Rowland wrote. He also noted a recent case which he said supported that premise.

The patent application follows another issued to Stanford in 1980 which covers the basic techniques of gene cloning. The current application was filed in 1974 and covers products resulting from the use of the technique. (These products, called transformants, are the result of intermediate steps between the genetic raw material and the desired commercial product).

Seventy-three licenses have been issued by Stanford and UC on a nonexclusive basis for reasonable royalties based on the gene cloning techniques, Reimers said. Income to Stanford and UC so far has reached about $1.4 million.

Two products recently became commercially availiable, including insulin and a swine vaccine.

The techniques are powerful research tools for analyzing the working of genes. They also make possible the construction of "bacterial factories" that can safely produce large quantities of compounds important in medical treatment and other fields.

Because bacteria theoretically could be engineered to produce almost anything created naturally by plant and animal cells, the techniques developed by Cohen and Boyer may have significant applications in such diverse industries as energy, chemistry and agriculture.

Emigration changed Italian hopes

While most Italian emigrants to the U.S. expected to return home, "their experience in the U.S. made them too sophisticated to tolerate the Italy they had left," Assistant Prof. Dino Cinel declares in a new Stanford University Press book, *From Italy to San Francisco: The Immigrant Experience*(347 pp., cloth, $25).

Most emigrants were determined "to bring about changes at home—to make it possible for people like themselves to own land and preserve an agrarian way of life," he observes.

Those who came to San Francisco "adjusted with only minimum disruption. . . . Resettling in America was a major break with the past, but Italian settlements in San Francisco were essentially miniatures of settlements in Italy.

"For Italians, the most unexpected force for change was the failure of return migration. . . . Small scale capitalism in Italy could not survive in competition with the large-scale capitalism of the U.S. and northern Europe.

"Most Italian returnees never suspected that their old world was coming to an end, let alone that by temporarily emigrating to the U.S. they were hastening that end.

"It is doubtful whether Italian emigrants would have ever crossed the Atlantic had they foreseen the impossibility of returning to live in their native land. . . .

"Ironically, inevitably. . .temporary migration changed the very goals they wanted to achieve. The drive for material success put a premium on change; the attachment to tradition made them resist it. Neither goal could be pursued except at the other's expense.

Carpools

Ride wanted from El Camino Real, next to Emporium in Mountain View—either one way or both. Will pay gas allowance. My hours are 8-5. Call Karen at 7-4847 or 969-3514 (home).

Songs by Eisler, words by Brecht mark 'Cabaret Politique'

Alea II, the Music Department's ensemble for contemporary music, presents "Cabaret Politique" Friday, Nov. 12, at 8 p.m. in Tresidder Lounge.

Under the direction of Jonathan Berger, the music of Hanns Eisler and his trial by the House Un-American Activities Committee will come to dramatic life.

A stark courtroom will be the setting for the songs of Eisler, with words (in English) by his long-time collaborator Bertolt Brecht, interspersed with excerpts from the Committee's investigation into Eisler's background and "un-Americanism."

Eisler was a famous German composer, a student of both Webern and Schoenberg. Deported by the Nazis in the 1930s, he was brought to the U.S. under the personal auspices of Eleanor Roosevelt. Eisler lived first in New York, then in Hollywood, where he made his living as a freelance film composer.

In 1948 Eisler was deported back to East Germany—one of the Committee's many innocent victims. There he directed the Academy of Music in Leipzig until his death in 1962.

"Eisler is one of the greatest composers of the 20th-century," says Berger. "His songs range from jazzy cabaret, to patriotic marches, to complex, chromatic experimental pieces."

Doctoral voice candidates John Peter Gaffney (tenor) and Charles Fidlar (baritone) will take the parts of Hanns Eisler and the Committee, respectively. Voice major Nancy Kass will be the court stenographer who bursts into a few songs regarding feminist issues.

Eisler's sextet, *Fourteen Ways of Describing Rain*, will be performed as the Committee takes a recess. A 12-tone work composed for a Hollywood film, it is written for piano (Liora Bresler), flute (Yvonne Kendall), cello (Marianne Cleary), viola (Eric Kujawsky), violin (David Jaffe), and clarinet (Joseph Limacher).

Tickets for Cabaret Politique are $4 general, $2 students, available at Tresidder Ticket Office (497-4317) and the door.

Zinoviev to speak Monday on campus

Alexander Zinoviev, Soviet philosopher, novelist, and dissident, will discuss U.S.-Soviet relations at 8 p.m. Monday, Nov. 8 in Annenberg Auditorium at Stanford.

His free public talk is sponsored by the Associated Students Speakers Bureau.

He is the author of *The Yawning Heights*, a novel whose publication in the West led to his emigrating from the Soviet Union, and *The Radiant Future*, a powerful modern parable compared to George Orwell's *1984* and *Animal Farm*.

Just turned 60, he held a research appointment at the Institute of Philosophy of the Soviet Academy of Sciences for 22 years and was a member of the philosophy faculty at the University of Moscow for 14 years prior to his emigration.

His Soviet citizenship has been revoked by Leonid Brezhnev for "behavior damaging to Soviet prestige."

I-Center to show films about China

The International Center's Other Cultures film series will present two films on modern China at 7:30 p.m. Thursday, Nov. 11.

The first film, "Beijing," takes a close look at China's capital by contrasting the lives of its young and old inhabitants against the backdrop of both the ancient and modern aspects of the city.

"Beijing" was made by the first American filmmakers to arrive in the People's Republic after the United States established full diplomatic relations.

"The Giant Panda" is a film produced in the People's Republic which examines China's most popular and most endangered species.

The I-Center's China segment of the Other Cultures film series is a part of the ongoing Thursday night film program designed to be both entertaining and educational. Admission is free; however, a 75-cent donation is requested at the door.

A typical Marson print

Marson print showing

Marson, Ltd., of Baltimore will exhibit for sale its collection of original Oriental art from 11 a.m. to 5 p.m. Wednesday and Thursday, Nov. 3-4, in the lobby of Tresidder Union.

The collection contains prints from the 18th century to the present, including woodcuts, etchings, lithographs, serigraphs, and mezzotints, at a wide range of prices. They are shown in open portfolios, and browsing is encouraged.

Color photographs shown by Kuffler

Color photographs by Damien Kuffler will be shown through the month of November in both the Coffee House and second floor galleries at Tresidder Union, Stanford University.

The work included in the exhibits is from two series: Views through a Natural Lens, the world as reflected in drops of water; and California Vignettes, the larger landscape of this state.

Photographs from both series will be represented in each exhibit area.

Kuffler has been a postdoctoral research fellow in the Department of Neurobiology at Stanford for four years.

Local dance groups to perform at Roble next weekend

The Stanford Dance Division will present an invitational dance concert at 8 p.m. Friday and Saturday, Nov. 12-13, in the Roble Dance Studio on campus.

The first event of its type to be offered by the division, the performance will feature works by Stanford alumni and Bay Area choreographers, including Ellen Bromberg, Nancy Fenster, and Regina DeCosse.

In addition, members of the Stanford Dance faculty will perform "Sleeping Sonata" by John Goodwin, director of the Los Angeles-based Dime-a-Dance Company currently working on Broadway in New York City.

The Roble Dance Studio has been a popular performing space on campus for many years. With a recently refinished floor, newly installed sound system, and the anticipated purchase of lighting equipment for the studio, the Dance Division hopes to convert it into a versatile and attractive performing center. Events other than dance will be included in future performing seasons.

Workshops with members of the Twyla Tharp and Paul Taylor companies will be held in conjunction with the University's Lively Arts Series. Also upcoming are a faculty concert during February's "Dance Week" and the annual "Spring Migration."

Tickets for the concert at $4 general admission and $3 for students will be available at the door.

North is I-Center lunch lecturer

Prof. Robert North, political science, will speak at next Tuesday's Luncheon-Lecture at noon at the International Center.

North will speak on "Worldwide Competition for Scarce Resources" and, specifically, the way in which that contributes to international conflict.

North came to Stanford in 1948 to earn a master's degree and later a Ph.D. He has been a member of the faculty since 1957.

North currently specializes in international relations and has published *The World That Could Be* as well as numerous other books and well over 100 articles for professional journals.

North's discussion is part of the International Center's continuing Tuesday Luncheon-Lecture program. This quarter the program will probe the origins of world problems which elude peaceful settlement.

The Tuesday Luncheon-Lecture includes a hot lunch (limited to 40). Tickets for the lunch go on sale at the I-Center one week in advance at $2.50. The lecture is free, and brown baggers are more than welcome. For more information phone the I-Center at 497-1831.

Charles Garoian

Performance art subject of Faculty Club exhibition

Performance art as teaching methodology will be exhibited at the Faculty Club by Charles Garoian, art instructor and chairman of the Art Department at Los Altos High School, through the month of November.

The exhibit of photographs and texts by Garoian demonstrates performance art created by students at Los Altos High over the past 13 years.

A Stanford Ph.D. candidate in art education, Garoian has had experience in many types of art, including a stint as a graphic artist for the University of California Agricultural Extension Service in Fresno County. He has exhibited in many media and won awards in painting, sculpture and performance, including a grant and one-man exhibit at San Francisco Museum of Art in 1974.

Among the conceptual performances he has helped to present at Los Altos High were: Five Tons of Ice, a monument in ephemerality; Sand Pyramids, art as paradox; Drill Team, art as social commentary; and Dialogue with an Object of Conversation.

Garoian's theory is that performance art serves high school students because it allows them to bring their personal conceptions out and apply them toward emotional and conceptual growth.

Performance art allows students to apply their need for independence in a context where experimentation, pranking, and improvisation are regarded as creative play or conceptual brainstorming rather than rebellion. It provides for the creation of personal points of view and also serves the culture by providing new possibilities—i.e., cultural growth.

Once the students develop their own creative potential, they can appreciate the values, attitudes and beliefs of the past through a personal, experiential and conceptual perspective that they have created for themselves.

Garoian, in addition to being a frequent lecturer, panelist, and writer on his theory of teaching performance art, has served as president of California Art Education Association. He also teaches art history, as well as drawing, painting and other traditional art forms.

Child psychologist to speak Monday

Child psychologist David Elkind will discuss the pressures he believes are placed on contemporary children to grow up too quickly. The lecture is scheduled for 8 p.m., Monday, Nov. 8 at Jordan Hall, Room 040.

The lecture will be open to the public for a $15 donation for the scholarship fund at the Bing Nursery School.

Elkind, chairman of the Eliot Pearson Department of Child Study at Tufts University in Massachusetts, is the author of several books, including *The Hurried Child*; the subject of his Stanford lecture.

"We dress our children in miniature adult costumes, we expose them to gratuitous sex and violence, and we expect them to cope with an increasingly bewildering social environment," Elkind writes.

His lecture is the first in the Bing Lecture Series, part of an effort by the school's director, Carol Lou Young-Holt, to raise scholarship funds.

Besides the lecture, there will also be a book-signing party at 4 p.m., Sunday Nov. 7 at Bing.

Reservations for both events can be obtained from Bing School or by calling 497-4865.

SLAC researcher schedules talk

Helen Quinn, Ph.D., a research fellow at SLAC, will lecture on "What is the World Made of? (a particle physicist's view)" at 4:15 p.m. Friday, Nov. 12, in Skilling Auditorium.

Her lecture is the first in a monthly series sponsored jointly by Women in Science and Engineering and the Dean of Graduate Studies and Research. Speakers will be Stanford women faculty and graduate students in science and engineering.

The series is designed to promote interdisciplinary discussion among women in engineering and the sciences by providing a regular forum where non-technical lectures on research topics are followed by informal discussion over refreshments.

New employees topic of workshop

"Job Stress and the New Employee"—a one-session workshop for employees in their first six months of a new job at Stanford—will be sponsored by the Help Center noon to 1:30 p.m. Wednesday, Nov. 10, at the Galvez House.

The workshop will be presented by Help Center counselors Sharon Levin and Larry Starkey. Issues to be addressed are: job expectation vs. job realities; the emotional and physical components of being new; what job stress is, and how it relates to the new employee; and suggestions for eliminating or modifying job stress.

Places in the workshop should be reserved by calling 497-4577 before Wednesday, Nov. 3.

The Help Center is an employee benefit program open to Stanford University, Children's Hospital, Stanford Medical Center and SLAC employees and their immediate families. All workshops, seminars and counseling sessions are free.

Emanuel Ax

Pianist Emanuel Ax to perform, hold master class

Pianist Emanuel Ax, winner of the first Arthur Rubinstein international piano competition in Israel and the prestigious Avery Fisher Prize, will perform at 2:30 p.m., Sunday, Nov. 7 in Memorial Auditorium at Stanford.

The following pieces will be included in the program: Haydn's "Sonata in C Major, Hob. XVI/48"; Schoenberg's "Six Little Pieces, Op. 19"; Beethoven's "Variations and Fugue in E flat Major, Op. 35"; and Chopin's "Ballade in F minor, Op. 52"; "Three Mazurkas," and "Andante Spianato and Grande Polonaise, Op. 22."

In addition to his piano recital, Ax will also give a master class to four pre-auditioned students at 7 p.m., Saturday Nov. 6 in Kresge Auditorium. Master classes are open to the public as observers.

The students selected for the class and what they are playing is as follows: Susan Snyder, Beethoven's 32 Variations on a theme in C minor; Kay Bedenbaugh, Debussy's L'isle joeuse; Esther Chung, Schubert's Sonata in A minor, Op. 143; and Edmund Correia, Chopin's Barcarolle.

Now in his early thirties, Ax is considered to be an "old master" of the pianoforte and has a distinctly romantic approach to piano literature.

Born in Lvov, Poland in 1949, Ax moved to the United States at the age of 12. He studied piano with Mieczyslaw Munz at the Juilliard School of Music in New York.

Ax performs regularly with such orchestras as the New York Philharmonic, the Chicago Symphony Orchestra and the Cleveland, Pittsburgh, Los Angeles, and St. Louis symphonies.

Tickets for Ax's recital range from $8.50 to $11.50. Student tickets are $3 off any ticket. Tickets to the piano master class are $5 and senior adults and non-Stanford students are $3.

Do your laps at SCRA

Stanford Campus Recreation Association, 875 Bowdoin, plans to offer a five-month winter lap swim from Nov. 1 to the end of March 1983.

Daily swim hours are anytime between 7 a.m. and dusk. The fee is $375 per family.

Members of the Stanford community may call 857-0414 for more information.

Bylsma plans cello concert featuring three Bach suites

The Lively Arts at Stanford will present Anner Bylsma, considered to be the Rostropovich of the Baroque cello, at 8 p.m., Friday, Nov. 5, in Dinkelspiel Auditorium.

Bylsma's program will consist of Suites No. 2, in D minor, No. 3 in C Major, and No. 6 in D Major for Unaccompanied Violoncello by Johann Sebastian Bach. The remaining three suites (Nos. 1, 4, 5) will be performed at 8 p.m., Saturday, Nov. 6, in Knuth Auditorium at San Francisco State University.

Bylsma also will conduct a coaching workshop at 3:30 p.m., Friday, Nov. 5, in Dinkelspiel. Participants will be students of Tom Stauffer and Irene Sharp. The workshop is free and open to the public as observers.

Born in 1934 in the Netherlands, Anner Bylsma started his musical studies at the age of three. He studied cello at the Royal Conservatory in the Hague with Carel van Leeuwen Boombamp, cellist in the Netherlands Quartet.

After receiving the Prix d'excellence in 1957, he went on to win first prize in the Pablo Casals Competition in 1959. Starting in 1962, he spent six seasons as principal cellist of the renowned Concertgebouw Orchestra of Amsterdam under Bernard Haitenk.

Bylsma is perhaps best known as an interpreter of music of the Baroque and Early Classical periods. He is a specialist of the Baroque cello, the instrument to which he has devoted most of his energies during the past 14 years.

Anner Bylsma's international reputation is based on numerous recordings and concert appearances, and especially on his interpretation of the Bach Suites for Unaccompanied Cello. These pieces were long considered to be mere musicological curiosities until Pablo Casals rediscovered them and revealed their musical worth.

Anner Bylsma

Bylsma's historically accurate conception and authentic rendering, evidence of his complete understanding of the structure, have garnered critical praise worldwide. His recordings of the Suites, which rivals the great Casals recording, was released last year.

Bylsma is currently on the faculties of the Amsterdam Sweelinck Conservatory and the Royal Conservatory in The Hague.

For ticket information, call Tresidder Ticket Office, (415) 497-4317.

Stanford Symphony opens new season

Stanford's symphony and chamber orchestras, under the direction of Andor Toth, will perform an exciting program at 8 p.m. Saturday, Nov. 13, in Dinkelspiel Auditorium.

Presented by the Department of Music, the Chamber Orchestra will play Haydn's *"Oxford" Symphony No. 92* in honor of Haydn's 250th birthday.

The Symphony Orchestra will perform Stravinsky's *Pulcinella Suite* in honor of that composer's 100th birthday, and Rachmaninoff's *Piano Concerto No. 2* with pianist Alan Gampel.

Gampel is a sophomore at Stanford with a very impressive background. He has soloed at the Hollywood Bowl and with several California orchestras, among them the California Chamber Symphony and the Ventura Symphony. In 1981 he received the Presidential Scholars Award and was a first-place winner in the Music Teachers Association of California Piano Concerto Competition. He studies with Adolph Baller.

Tuneful and exuberant, Stravinsky's *Pulcinella Suite* is a colorful, virtuoso ballet and a *tour de force* for the orchestra.

Oxford University awarded Haydn an honorary Doctor of Music degree on his first visit to England in 1790. Haydn conducted his vital, refreshing *Symphony No. 92* then, and it has been known as the "Oxford" ever since.

Tickets for the November 13 orchestra concert are $4 general, $2 students and senior citizens, available at Tresidder Ticket Office (497-4317) and the door. The Music Guild will serve refreshments.

Baroque Ensemble plans free concert

The Stanford Department of Music will present the Baroque Ensemble in concert at 8 p.m. Sunday, Nov. 14, in Annenberg Auditorium.

Under the direction of Prof. George Houle, the free concert will include:

Corelli—Sonata VII, op. 5, for violin (Marmee Eddy), viola da gamba (Patricia Halverson), and harpsichord (Vera Kochanowsky);

Marais—Suite in D Major from the *Troisieme Livre de pieces de viole*, 1711, for viola da gamba (Roland Hutchinson) and harpsichord (John Toenjes);

Rameau—Suite No. 1 from *Pieces de Clavecin en Concert* for harpsichord (Vera Kochanowsky), flaute traverso (Yvonne Kendall), and viola da gamba (Patricia Halverson);

Handel—Concerto grosso, op. 6, No. 4 for Baroque Orchestra, led by Marmee Eddy.

This will be the first performance of Stanford's recently formed Baroque Orchestra.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Nov. 3, to cover the week of Mon., Nov. 15, through Sun., Nov. 21.

LATE ANNOUNCEMENTS

Wed., Nov. 3. Structural Biology Dept. Lecture: "The Genetics of Myosin Assembly" by Dr. Henry Epstein, Baylor College of Medicine. Noon. Fairchild Bldg., Room D-102.

Thurs., Nov. 4. Amnesty International USA Meeting: Showing an amnesty film followed by letter writing on behalf of political prisoners. Noon-1 p.m. Room 190, Law School. (Subsequent weekly meetings, same time but in the I-Center.)

MONDAY, NOVEMBER 8

Radioscience Seminars: "Distribution of Particle Sizes in Saturn's Rings" with Howard Zebker, S.U. 4:15 p.m. McCullough Bldg., Room 127.

Numerical Analysis Seminars: "A Systolic Architecture for the Singular Value Decomposition" with Franklin Luk, Cornell Univ. 4:15 p.m. Math 380C.

Stanford Film Society: "8½." 7 p.m. Kresge Aud. $1.50.

ASSU Speakers Bureau: Alexander Zinoviev, Russian politcal writer and novelist deported from Moscow in 1978, will speak on the Russian political system. 8 p.m. Annenberg Aud. Public cordially invited.

TUESDAY, NOVEMBER 9

I-Center Tuesday Lecture-Lunch Series: "World Wide Competition for Scarce Resources" by Prof. Emeritus Robert C. North. Noon. I-Center. Lunch tickets available one week in advance. $2.50. Brown baggers welcome.

Stanford Museum Art Tours: "Printmaking Techniques." A lunch hour tour beginning at 12:15 p.m. Stanford Museum. Open to all. (Tour repeated tomorrow, same details.)

Fluid Mechanics Seminar: "Space Shuttle Photographic and Television Observations of Gasdynamics in Space" with Peter Banks, S.U. 4:15 p.m. Skilling Aud.

Communications Design Seminar: "Direct Broadcast Satellites to Home Receivers" with Bernie Jacobs of SatCom (div. of Orrox Corp.). 4:15 p.m. McCullough Bldg., Room 128.

Professional Opportunity Program for Ph.D.s: Academic Interview Workshop. 5 p.m. Career Planning & Placement Center. Sign up by calling 497-2009. (Second workshop tomorrow, same details.)

Drama Dept. Production: Bertolt Brecht's "The Good Soul of Setzuan" directed by Geoffrey Reeves from England. A parable set in modern China. 8 p.m. Little Theater. $4 general, $2 students and seniors. (Nightly through Dec. 13.)

Music Dept. Concert: Chamber music by students of Margaret Fabrizio. 8 p.m. Tresidder Lounge. Free.

WEDNESDAY, NOVEMBER 10

Latin American Studies Bag Lunch Series: "The State and the Private Sector in Venezuela" with Clemy M. de Acedo, Princeton Univ. Noon. Bolivar House, 582 Alvarado Row.

Stanford Staffers Program: African Music with Prof. James Gibbs, Anthropology Dept. Noon. Anthropology Museum, Bldg. 110.

Biological Sciences Dept. Special Seminar: "RNA Splicing in Neurospora Mitochondria: Mutants, Mechanism and Relevance" with Dr. Alan M. Lambowitz, George Washington Univ., St. Louis, MO. Noon. Room T-175, Herrin Labs. Open to the public.

Ecumenical Ministries Wednesday Lunch Discussion: "A Militarized Economy" by Dave McFadden. Noon. Casa Zapata (Stern Hall) dining room. Bring bag lunch or arrange to eat at Zapata. Open to all.

CROW Women at the Top Lecture Series: The speaker is Liz Gallese, staff reporter, Wall Street Journal. Noon. Terman Aud. Open to all.

EE 380 Computer Systems Laboratory Seminar: "Buffer Performance in DAX-11/780" with Doug Clark, DEC, Tewksbury, MA. 4:15 p.m. Terman Aud.

Electronics in Medicine Seminar: "Digital Picture Archiving and Communication Systems in Radiology" with Dr. Andre Duerinckx, Philips Ultrasound, Inc. 4:15 p.m. McCullough 134.

Physics Dept. Colloquium: "Anomalons" with Prof. Yasha Courant, Lawrence-Berkeley Laboratory. 4:15 p.m. Physics Lecture Hall, Room 101.

Colloquium of the Dept. of Chemical Engineering: "Foam Flow" with Prof. Robert Prud'homme, Princeton Univ. 4:15 p.m. Chemical Engineering Conference Room.

Professional Opportunity Program for Ph.D.s: Academic Interview Workshop. Second day. See details for Tues., Nov. 9.

Black Alumni Speaker Series: "Strengthening Community Commitments: Strategies for Public Service" by Chuc Kemesu, Project Services Coordinator, Upward Bound Project, Univ. of San Francisco. 7:30 p.m. CERAS Room 204. Public cordially invited.

The Lively Arts at Stanford: Richard Stoltzman, clarinet; Walter Trampler, viola; Lee Luvisi, piano. Mozart: Trio in E-flat Major, K. 498; Shostakovich; Sonata for viola and piano, Op. 147; Brahms: Sonata in E-flat Major for clarinet and piano, Op. 120, No. 2; Bruch: from Eight Pieces, Op. 83. 8 p.m. Dinkelspiel Aud. $11.50, $10.50; students $3 off these prices.

Drama Dept. Production: Brecht's "The Good Soul of Setzuan." Directed by Geoffrey Reeves. See details for Tues., Nov. 9.

THURSDAY, NOVEMBER 11

Stanford Geothermal Program Seminar: "Silicic Volcanic Centers Supporting Geothermal Systems in the Mexican Neo-Volcanic Belt" with Gail A. Mahood, Geology Dept. 1:15-2:30 p.m. Room B67, Mitchell Bldg.

Condensed Matter Physics Seminar: "Overview of Amorphous Silicon" with Prof. Dr. Josef Stuke, vis. prof. from the Univ. of Marburg, Germany. 4:15 p.m. Applied Physics 200.

Solid Mechanics Seminar: "Towards a Qualitative Understanding of Materials" with Dr. James Ryder, Lockheed Burbank Rye Canyon Research Lab. 4:15 p.m. Skilling Aud.

Materials Science & Engineering Special Seminar: Same details as for the Condensed Matter Physics Seminar for this date.

Japan Society/Committee for Art Film Series: "Ikiru" (1952) dir. by Akira Kurosawa. An aging civil servant discovers that he is dying and realizes "he has been dead a long time without even knowing it." He attempts to find out how "to really live." 7:30 p.m. Annenberg Aud. $3 general, $1 students.

I-Center Other Cultures Film Series: "Beijing"—a new film conveying the texture and flavor of the venerable Chinese capital; and "The Giant Panda"—a visit with China's most celebrated and endangered species. 7:30 p.m. I-Center. 75 cents requested at the door.

Drama Dept. Production: Brecht's "The Good Soul of Setzuan." See details for Tues., Nov. 9.

STARTS Open Mike: Sign up at STARTS Office. 9 p.m. Coffee House. Free.

FRIDAY, NOVEMBER 12

Applied Mathematics Lectures: "Self-focusing and modulational analysis of nonlinear Schrodinger equations" by Dr. Michael Weinstein, S.U. 3:15 p.m. Room 380C (Mathematics Corner basement).

Materials Science & Engineering Dept. Colloquium: "Causes and Prevention of Failures in Surface Condensers" with Dr. B. C. Syrett, EPRI. 3:30 p.m. Peterson Laboratory, Room 550A.

Stanford Women in Science and Engineering Lecture Series: "What is the World Made of? A Particle Physicist's View" by Dr. Helen Quinn, research fellow at SLAC. 4:15 p.m. Skilling Aud. All members of the Stanford community welcome. Inquiries, 497-2496.

Music Dept. Concert: Alea II presents "Cabaret Politique." An informal evening of topical music and theater by Weill, Eisler, and others. Jonathan Berger, director. 8 p.m. Tresidder Lounge. Free.

Stanford Dance Division Presents: An Invitational Dance Concert featuring works by alumni and Bay Area choreographers. 8 p.m. Roble Dance Studio. $4 general, $3 students. (Another concert tomorrow night, different program.)

Stanford Savoyards Production: Gilbert & Sullivan's "H.M.S. Pinafore, or the Lass that Loved a Sailor." 8 p.m. Dinkelspiel Aud. $5 general, $3 students. (Performances this week, tomorrow at 2 p.m., Sunday at 8 p.m.)

Drama Dept. Production: "The Good Soul of Setzuan" by Brecht. See details for Tues., Nov. 9.

STARTS Great Directors Film Series: "The Chronicle of Anna Magdelena Bach" dir. by Jean Marie Straub. The life and music of Johann Sebastian Bach and his second wife Anna. 8 p.m. Geology Corner, Room 320. $3.75 general. $2.75 students.

STARTS Live Entertainment: 9 p.m. Coffee House.

SATURDAY, NOVEMBER 13

Stanford Savoyards Production: A matinee performance of the G&S "H.M.S. Pinafore." 2 p.m. Dinkelspiel Aud. $5 general, $3 students.

Music Dept. Concert: Stanford Symphony & Chamber Orchestras. Andor Toth, conductor. Haydn—Symphony No. 92, "Oxford" in celebration of Haydn's 250th birthday. Rachmaninoff—Piano Concerto No. 2 in C minor, op. 18, Alan Gampel, pianist. Stravinsky—Pulcinella Suite. 8 p.m. Dinkelspiel Aud. $4/$2.

Drama Dept. Production: Brecht's "The Good Soul of Setzuan." See details for Tues., Nov. 9.

Stanford Dance Division: An Invitational Dance Concert. See details for Fri., Nov. 12.

SUNDAY, NOVEMBER 14

University Public Worship: Student Workshop Service, 8:30 a.m.; Ernle W. D. Young, assoc. dean of the chapel, 11 a.m.; Catholic Mass, 4:30 p.m.; Evening Communion in Memorial Church Round Room, 6 p.m.

The Lively Arts at Stanford: Guarneri String Quartet. Haydn: Quartet in G minor, Op. 74, Nov. 3 "The Rider"; Brahms: Quartet in B-flat Major, Op. 67, No. 3; Debussy: Quartet in G minor, Op. 10. 2:30 p.m. Dinkelspiel Aud. $11.50, $10.50; students $3 off these prices.

ASSU Sunday Flicks: "Ragtime." 6:30 & 9:30 p.m. Memorial Aud. $1.50.

The Lively Arts at Stanford Master Class: Chamber ensembles perform. Michael Tree, violist with the Guarneri Quartet comments. 7-10 p.m. Kresge Aud. $5 general, $3 senior adults and non-Stanford students, Stanford students free. Proceeds to the Music Guild's scholarship fund.

Stanford Savoyards: "H.M.S. Pinafore." See details for Fri., Nov. 12.

Music Dept. Concert: Stanford Baroque Ensemble. George Houle, director. 8 p.m. Annenberg Aud. Free.

EXHIBITS

Paul Harris—Still Life. Stanford Museum. Through January 2.

Venice in the 18th Century. Paintings, drawings, prints and decorative arts. Stanford Art Gallery. Through December 19.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through November.

Wood Construction and Process Sculpture by E. David Camardo. For library environment. The Jonsson Library of Government Documents, Green Library. Through December.

Photographs by Marianne Skogh. Gold Lounge, both entries, and other locations. Stanford Faculty Club.

Maps Are For Use. An assortment of maps and related cartographic reference works available from the Central Map Collection. Meyer Library Lobby. Through November 19.

Acrylic on Canvas Paintings by Win Belton. Reception, Fri., Nov. 5, 5-7 p.m. Bechtel International Center. November 3-30.

Mountains of Nepal, Pakistan and Afghanistan. Photos by Damien Kuffler. Tresidder 2nd floor gallery. Month of November.

Flowers in Miniature by Damien Kuffler. Coffee House Gallery. Month of November.

Ansel Adams. Books, letters, photographs. Exhibit coordinated by the Stanford Museum and the Dept. of Special Collections. Green Library, Special Collections Gallery, second floor, West Wing. Through November 24.

Fabrizio's students give concert Tuesday

Students of Margaret Fabrizio, senior lecturer in harpsichord and early piano, will perform at 8 p.m. Tuesday, Nov. 9, in Tresidder Lounge.

Eunice Schroeder, fortepianist, will play Haydn's Sonata in E-flat, Hob. XVI:49.

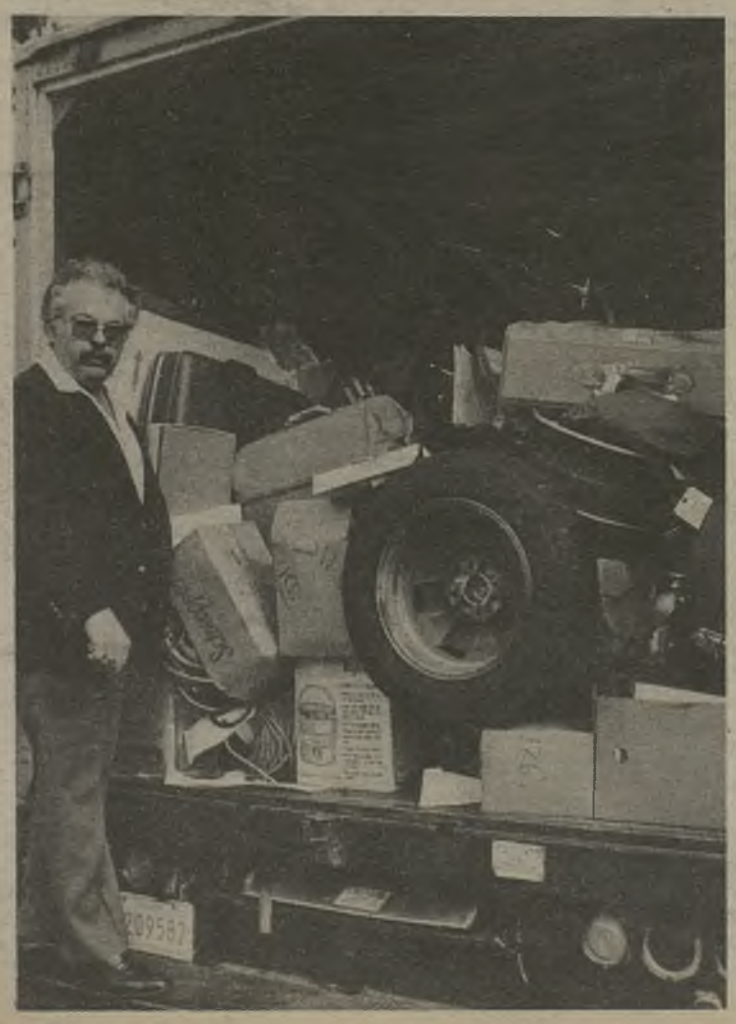
David Ng-Quinn, D.M.A. candidate, will perform two seldom-heard Capriccios by Muzio Clementi on the fortepiano.

John Toenjes, well-known local harpsichordist and Music Department alumnus, will perform four sonatas by Domenico Scarlatti.

The concert will conclude with J. S. Bach's Concerto in G minor, written for harpsichord (Jill Mueller), two violins (Herbert Myers and Anne Marie De George), viola (Roland Hutchinson), and cello (Jenny Gordon).

CAMPUS REPORT

Volume XV, Number 8 | A publication for Stanford University faculty & staff | November 10, 1982



There's rain in the spaghetti sauce, but they're having a wonderful time. The story starts on page 3.

Burglary suspect's in jail, loot recovered

Robert Lee O'Connor, suspect in more than 130 Midpeninsula burglaries, was arrested in a lightning series of predawn raids coordinated by San Mateo County sheriff's officers on Tuesday.

A cat stolen from Palo Alto led to his capture.

Stanford Police Capt. Raoul Niemeyer said O'Connor was caught trying to leave through a back window at the residence of Nancy Ann Burt at 3014 14th St., Montara, between Half Moon Bay and Pacifica. Sgts. Rick Enberg of Stanford and Brian Beck of San Mateo County made the arrest.

Stanford Police Capt. Raoul Niemeyer shows off the first truckload of items removed from the home of Robert O'Connor in La Honda.

O'Connor was taken to Santa Clara County jail on a warrant including one count of vehicular theft, six counts of burglary, and one of possession of stolen property, with bail of $250,000.

About 14 officers and a dog team surrounded the Burt residence before the 5:30 a.m. raid. Burt was arrested on charges of resisting and delaying a police officer in the performance of his duty and taken to Redwood City for possible booking.

O'Connor's wife, Maureen, was arrested in a simultaneous raid at their residence on Sears Ranch Rd. in La Honda. Niemeyer said police had a warrant on the same charges as her husband, with $150,000 bail. She was taken to Redwood City but may be transferred to San Jose. She would not waive her right to be booked in San Mateo County.

A third raid on Kehoe Avenue in San Mateo brought no results. About two dozen officers from Stanford, Palo Alto, Los Altos, San Mateo County and Santa Clara County cooperated in the raids, which included a dog team at each location.

Sheriff-elect Brenden MacGuire, chief of detectives in San Mateo County, met with Niemeyer Monday morning to help plan the action. Niemeyer obtained the warrants later Monday. On Thursday, police recovered an estimated $750,000 at O'Connor's La Honda home.

More property believed stolen was recovered at the Burt residence. Niemeyer has obtained two more search warrants in San Mateo County, which he is pursuing

Departments asked to list budget cuts

Stanford departments have been asked to deliberately underspend their current budgets and to identify long-term cuts of one to five percent as part of a major new belt-tightening effort.

Triggered mainly by lower than expected growth in research volume, the new cuts come on top of previous announced plans for a one percent budget reduction this year.

As is their custom, University officers will discuss the budget outlook with the Faculty Senate at its regular meeting Thursday, Nov. 11.

Letters from budget officers calling on departments to voluntarily reduce spending this year and to identify possible budget cuts for the next three years are being distributed this week to University administrators.

Seeking $1 million toward the University's anticipated $3 million shortfall this year, Provost Albert Hastorf is asking departments to underspend their current operating budgets and return savings to the central operating budget.

Leaving staff vacancies unfilled, reducing equipment purchases, and restricting travel were among the steps Hastorf suggested as one-time measures. The current operating budget totals $207 million.

Looking to the future, departments are asked to "identify reductions in operating budgets up to five percent of the current base" in an accompanying letter from Raymond F. Bacchetti, vice-provost for management and director of University budgets.

The five percent figure is intended as an exercise to get departments thinking about possible cuts. Actual cuts are expected "to exceed the previously expressed one percent and could go as high as four percent in 1983-84," according to Bacchetti. The target for cuts will be set in about two weeks.

"It seems likely that some fraction of the reduction target will be achieved through across-the-board cuts and some will be selective and based on an assessment of consequences to programs and operations in general," he said. The division between the two cutting alter-

James Leckie

Anne Mellor

Robert Rabin

Ewart Thomas

Leckie, Mellor, Rabin, Thomas new fellows

Four faculty members have been selected as University fellows for 1982-83, President Donald Kennedy has announced.

They are Profs. James Leckie, civil engineering; Anne Mellor, English; Robert Rabin, law; and Ewart Thomas, psychology.

They will join Associate Profs. Michael Bratman, philosophy, Allen Cooper, medicine, and Ellen Markman, psychology, who were named fellows last year.

University fellows receive five months' salary support to pursue projects of their own choosing. This may count towards summer employment or as time off from their normal departmental responsibilities during the academic year. Typically, their projects are broader than their own academic discipline.

A Stanford faculty member since 1970, Leckie has taught about a third of the core courses in the environmental engineering curriculum.

Mellor has directed the undergraduate program in English for the past three years, directed the new program in feminist studies, heads the Faculty Committee on Committees, and this year received a dean's award for teaching in the School of Humanities and Sciences.

Rabin has been a Stanford faculty member since 1973, teaching administrative law, legal process and torts. Last year he headed the faculty search committee for a new Law School dean.

Thomas came to Stanford from the University of Michigan in 1972, earned tenure the following year, and received a Guggenheim fellowship in 1976 for theoretical and empirical studies in psychology and economics.

Since the University fellows program was established in 1969, at least 40 faculty have been selected for this honor.

Administrative members of the program this year will include Robert Freelen, associate vice-president for public affairs; Fred Hargadon, dean of admissions; Albert Hastorf, provost; Gerald Lieberman, vice-provost and dean of graduate studies and research; Dominick Purpura, associate vice-president and dean of the School of Medicine; Joel Smith, secretary to the Board of Trustees; and Trustee John A. Ditz. They may meet biweekly with the fellows.

Hopkins, Massy win prize for book on planning models

Two Stanford scholars have received the Frederick W. Lanchester $2,000 prize of the Operations Research Society of America for their pioneering book on *Planning Models for Colleges and Universities*, published by Stanford University Press.

They are David S.P. Hopkins, executive assistant to the vice-president for medical affairs, and William F. Massy, vice-president for business and professor in the Graduate School of Business.

Their materials now are being used by more than 120 institutions across the country. Applications range from theological schools to athletic programs, from endowment portfolios to faculty tenure and dormitory dining.

The ORSA called their book "the first comprehensive treatment of diverse models that have been developed to help university planners chart the future of their institutions. . . . Hopkins and Massy have intertwined mathematical models, practical insight, and sensitivity to the subtleties of university administration."

In their book, Hopkins and Massy observe that "models will not increase scarce resources. What they will do is increase an institution's chance of using those resources wisely. . . .

"The problems are getting tougher; the lead times are longer, the financial constraints grow tighter every day.

"Effective modeling in an academic setting requires a clear sense of what is important for the institution. It can help provide a more stable and predictable financial environment in which the academic process can flourish."

They admit there is legitimate concern that "the quantifiable will drive out the profound, that the academic institution will take on too many of the characteristics of a business. But these things can happen without models as easily as with them."

Properly used, computer models can help solve immediate problems can help solve immediate problems and "in the long run. . .help conserve academic values," they believe.

"Academic officers should never delegate line authority to models or to their architects. They must maintain personal responsibility for decision-making at all times."

Hopkins and Massy strongly recommend that each institution develop its own set of models, rather than adopting them ready-made from an outside source. The results will then reflect differences in style of record-keeping and decision-making at each college.

In addition, "the very process of model building almost always yields valuable insights about the system that is under study."

Their research was support in part by the Lilly Endowment.

Hansen labs research associate

W. W. Hansen Laboratories invites applications for a research associate position in the experimental study of high energy gamma ray astronomy on the Gamma Ray Observatory. The successful applicant will participate in the testing of the gamma ray telescope on the ground and to its operation in space.

A demonstrable interest in space physics and some experience in particle detection techniques are required. A willingness to participate in other projects involving the detection of gamma rays and X-rays at accelerator laboratories is desirable. The position is tenable, initially, for three years with the possibility of further extension.

Applications with curriculum vitae and the names and addresses of two academic referees should be sent to Prof. Robert Hofstadter, Department of Physics, by January 31, 1983. Stanford is committed to equal opportunity through affirmative action in employment and we are especially eager to identify qualified minority and women applicants.

Sloss and Arnett elected by alumni

Leon Sloss of Washington, D.C., has been elected 1983 president of the 50,000-member Stanford Alumni Association.

Assuming office with him in January as vice-president will be Dixon Arnett of San Francisco. Both were named by fellow members of the Alumni Executive Board at the group's fall meeting on campus.

A member of the Stanford Class of '49, Sloss heads his own consulting firm on national security affairs. He is a former vice-president of SRI International and has also served with the Bureau of the Budget, the Department of State, and the Department of Defense.

Long active in behalf of Stanford, he has been a member of the Alumni Association's governing body since 1979 and its vice-president during 1982. He is a member of Stanford Associates and a past president of the Stanford Club of Washington, D.C.

The Sloss family has long been associated with Stanford. The first Leon Sloss was an early member of the Stanford Board of Trustees. Leon Sloss Jr. was president of the Alumni Association in the 1940s. The incoming president and his wife, Virginia, have four children.

Arnett, a former member of the California Assembly representing southern San Mateo County, currently serves as deputy regional director of the U.S. Department of Health and Human Services, based in San Francisco.

A member of the Stanford Class of '60, he served for five years as the University's director of community relations. Before joining HHS he was vice-president for public affairs research at Claremont Men's College. He is the father of three.

Outgoing president of the Association is Albert J. Horn of Hillsborough.

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.

Published by the Stanford University News Service, Patricia J. Black, editor; Karen Marman, design assistant; Charles Painter and Ed Souza, photographers; Medicals news editor, Lisa Ames, ext. 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

Geology students on Klamath Mountain field trip go exploring

Autumn in the Klamaths; Watching how the continent grew

BY JOEL SHURKIN

Meghan Miller sat atop the van, hunching a bit against the wind and the beginning rain. She held up a colored map and explained to the students standing at the foot of the van how she spent her summer vacation.

Miller is one of a half dozen geology graduate students who have spent their summers mapping one of the most interesting and least studied areas of the West Coast, the Klamath Mountains in the northernmost part of California.

Miller is a small, frail-looking young woman, with light brown hair and blue eyes. She doesn't look tough enough to spend summers in heat and humidity, clambering alone over the crumbly rocks of the Klamaths. She is.

Her presentation was part of a field trip organized by students in the Department of Geology and accompanied by Geology Prof. Robert Coleman, who came to Stanford from the U.S. Geological Survey.

Many of the students had spent similar summers. Now they were getting to look at real rocks to match with names and processes they have been taught.

Miller pointed to the road cut behind her and explained her theory of the history of her site, the McCloud Reservoir in Siskiyou County, just south of the Oregon border.

Miller has been able to parse out some of its history, she says.

"There are a lot of problems with ages around here," she admitted. "That's what I'm trying to work out."

Below, the dark green water of the reservoir was unusually low. The water management people at the dam let much of it out, anticipating a very wet winter and a need for storage space. The wet winter had already arrived at McCloud Reservoir.

The students asked questions, made suggestions, took notes. Finally, the presentation over, they dispersed to the road cut, pouring over the wet rocks like supplicants at a shrine, hand lenses at the ready. The only other sound, above the soft rain, was the light clang of picks.

The Klamaths are interesting because at one time they were the bottom of the sea. The terrain is called "accretionary" by geologists, which means it piled up.

"When we say accretionary terrain, we're talking about bits and pieces of material that may have formed along the continental margins or may have formed out in oceanic areas," Coleman explained.

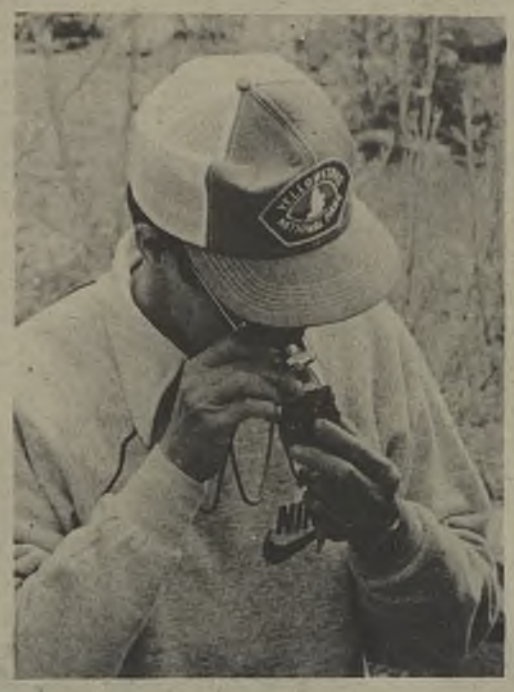
Since the 1960s earth scientists have known that the land areas of Planet Earth ride on about a half dozen thick, rocky plates, floating above the plastic heart of the earth like croutons in pea soup.

The plates are formed in mid-ocean ridges and push out toward land. In some places, however, plates run into each other. The notorious San Andreas fault is where the North American plate, upon which most of North America rests, crunches against the Pacific plate, which contains the eastern Pacific. That crunch produces earthquakes but not volcanos.

Sometimes one of the oceanic plates will "subduct," dive under a continental plate, scraping off the sea mountains, rocks and fossils, melting and forming magmas that produce volcanic chains on continental margins.

The main reason for students working in the Klamaths is to try to establish the mechanism for this accretionary process," Coleman said. "How do these bits and pieces of material that form, say offshore or at different latitudes—how do they accrete to the continent? What sort of tectonic process allows this to happen, subduction collision or eruptive processes?

"Can we use this sort of theory that we developed for the Klamaths for the rest of the world? I say, yes, we probably can, in that some of the ideas we get from the Klamaths may be applicable to the Alps or. . . to the Himalayas or other mountain ranges.



"That's the fortunate thing about geology, it repeats itself. Where you find serpentinite in the Klamaths it is the same as serpentinite in China. The idea is to look at this accretionary process in the light of the new plate tectonics theory. This gives us another degree of freedom which before we didn't have. . . . "

continued on next page

Prof. Robert Coleman

The salmon were ending their fatal battles and the steelheads had begun to invade the river. The students were more interested in the rocks which once formed the bottom of a sea.

Field trip...

continued from page 3

Not a lot of geologic work has been done in the Klamaths because of their remoteness, ruggedness, and amount of poison oak. The Klamaths are the home of Yreka and Happy Camp and other legendary gold-mining towns of the 'forty-niners. Gold is still mined and panned in the Klamaths.

There is also chromium and nickel in the oceanic rocks.

What Coleman and other geologists want to know is how these rocks and minerals accumulate through accretion.

"As a result, these studies, although they're not directly related to ore deposits, will help us perceive how these ore deposits develop in this kind of terrain."

Another reason for the Klamath explorations is to give the graduate students like Miller "an opportunity to work in a very complex and poorly-known terrain, so that a lot of work that they do both here and in the lab will be original research.

"The graduate students (Miller, Mortimer, Bruce Hill, Mary Donato, and Craig Manning) and Bob Coleman have done an outstanding job in putting the pieces together to offer an excellent geologic-tectonic interpretation for the complicated terrain of the Klamath," commented Prof. J. G. Lion, another field trip participant.

"That's one reason why this trip is so attractive."

"The main problem I'm focusing on is the structural deformation," Miller said later, "its geologic history as a whole, its stratigraphy, just the sequence of events and how it's recorded in the rocks.

"The real controversy in that area is whether it was an island off the coast of North America or if it developed a long way from North America and was brought in on an oceanic plate and then accreted on the edge of the continent." She calls the latter process "rafting."

If it was rafted, the area was probably riding on a plate that subducted beneath the continental plate, and was scraped off."

She is essentially looking at the bedrock upon which Mt. Shasta later was built.

To show off the graduate students' work and give undergraduates a feel for field work, about 50 geology students were transported to Siskiyou County in six vans, five of them rented.

After visiting Miller's site they set up camp in a Forest Service campsite along the McCloud River in a downpour.

The students fixed supper on a long table. Propane burners boiled spaghetti and tomato sauce. The students also fixed garlic bread and salad. But it was a losing proposition and the students tried to be as content as possible as they watched the rainwater collect in the spaghetti sauce.

Then they disappeared into their tents, most of which seemed to withstand the torrent. They slept to the sound of rain on nylon, river on rock.

The Klamath River, site of most of the exploration, generally runs from its beginnings in Oregon, southwest to the Pacific north of Eureka and Arcata. The water is dark, olive, cold, not particularly clear.

The Klamath is the spawning ground for salmon, most of which had finished their run up the river a few weeks earlier. A few stragglers remained, their last spark of existence devoted to swimming against the strong current to drop their eggs.

After the salmon come the steelhead trout, ocean-going trout which also spawn in the river but do not die in the process. The vanguard of the steelhead invasion was already upriver and could be seen and heard plopping in the current.

The next morning the vans headed north into Yreka. Two broke down and had to be repaired, but by mid-afternoon the caravan had crossed I-5 and the Klamath River, and the students walked up a riverside dirt road to Carson Gulch, the area surveyed by Nick Mortimer.

Mortimer, an Englishman, had spent two summers working in this area.

His past surveys had been happily uneventful. Coleman explained that the biggest danger facing geologists in northern California was stumbling into someone's marijuana field. Marijuana has become the largest cash crop in several counties and the pot farmers do not take kindly to intruders.

Although very little, if any, marijuana is grown there, Mortimer wrote to about 20 landowners around the gulch explaining who he was and what he was trying to do. He offered them free copies of his geologic map in return for permission to survey their land. Most of the rest of his territory was Forest Service or Bureau of Land Management land.

Mortimer also managed to avoid suspicion by hanging out at the local bar, The Swallows.

"I was in there most days when I was in the vicinity. It gets hotter than hell up here. I guess it gets into the 90s when you get into the hills. And it's pretty humid too! The Swallows is very attractive after an afternoon."

The denizens of Swallows are gold miners (Mortimer says a number of families support themselves with gold mining), farmers, and an occasional motorcyclist.

"They're a very strange bunch," he said. "They're very friendly, though, once I convinced them I wasn't after the gold. . . . "

Mortimer's site is fairly typical, he explained.

"You have these sequences of chert and argillite there that presumably formed in some kind of basin, an ocean basin, near some island archs (archipelagoes), something like the Sea of Japan. This seemed to be the main rock type in my area.

"Atop the chert and argillite are some volcanic rocks, including pillows (hard tubes of lava from the ocean floor), basalts, breccias and other rocks indicative of accretion.

"This would probably be some kind of sea mount, maybe like some of the Hawaiian Island chain, volcanic rocks," he said.

"The inference is that it was a sea mount at one time, but now it's all broken and deformed and since then all this stuff has been accreted in the

Grad student Craig Manning talks to the group

continued from page 4

Klamaths. You've got to pull the puzzle apart to infer what's going on."

He has found many marine fossils in his rocks, particularly radiolaria, a small creature with a silica skeleton.

"The Klamath rocks are so messed up that I guess geologists who are used to dealing with more intact rocks find it difficult to see how anything can be done with them," he said. "You've got to defocus your ideas slightly and admit that you can't tell for sure if this lava is an island arch or a sea mount or something like that.

"You've got to play with probabilities. You can usually piece together a fairly convincing story."

Mortimer spent most of his first summer in a tent in a campground, but feared his equipment would be stolen. Last summer he stayed in a Forest Service trailer in Yreka, which was more secure.

Samples of rock would be taken back to Stanford to be sliced into thin sections and studied. Coleman brought up a Geologic Survey thin section van some of the time so the work could be done on site.

The students clambered past an abandoned gold mine and up the side of one of the hills as Mortimer, who fancies a Sherlock Holmes deer-stalker hat, gave a running commentary on the rocks. At each stop the students attacked the rocks with their picks and hand lenses.

"They hand you a rock and tell you it's homogenous breccia with imbedded radiolaria, and you look at the rock—and it's shiny," said one student with good-humored exasperation.

That night the expedition camped next to the river on the parking lot of The Swallows; it was too dark and too late to proceed to the planned campsite. Mortimer was greeted by The Swallows crowd as an old friend. The noise lasted until about 2 a.m. It did not rain.

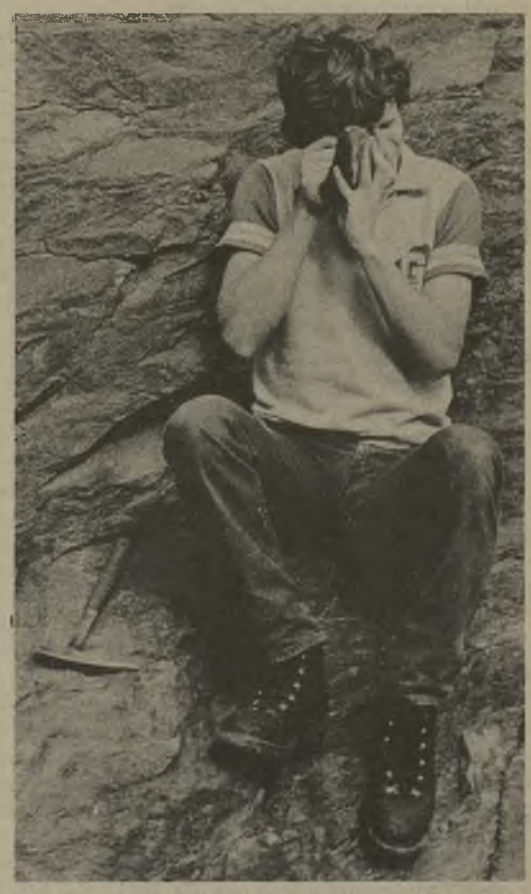
The next day the group traveled about 40 miles down the Klamath River Valley. Coleman lectured on the passing geology using the CB radios that connected the vans. At every stop the students erupted from the vehicles and were quickly crawling over the rocks, comparing finds.

Occasionally, a graduate student would give his report and was challenged by Elizabeth Miller, one of the professors attached to the group. It was done in a gentle way to probe how well the students had thought out their theories.

One had to row back a bit on his statements.

"I try to get a little audacious for a field trip," he explained.

The tour continued down the valley. The students, good geologists all, seemed to pay no attention to the real salient feature of the valley—its beauty.



Here, unlike most of California, trees understand autumn. Oaks, maples, alders, singly or in clusters, added color to the land. While the hills were carpeted mostly with evergreens, the green was interrupted constantly with golds, yellows, reds and browns.

The river streamed through grey rocks. An occasional salmon still struggled up-current.

The geology students were busy with the road cuts and the cliffs.

"The second they get out of the car they start banging rocks," one said, admiringly.

That's what they were there for.

Jonathan Berger takes over Alea II during 1982-83

Jonathan Berger, Stanford D.M.A. '82, has been appointed lecturer in music theory for 1982-83 and director of Alea II—the Music Department's ensemble for contemporary music.

Berger has two Alea programs planned for November: a *Cabaret Politique* on Friday, Nov. 12, featuring music by Hanns Eisler interspersed with portions of Eisler's trial by the House Un-American Activities Committee, and an evening of recent and innovative works by Stanford composers on Nov. 30.

"I think Alea II should be first and foremost an outlet for Stanford composers and Stanford performers interested in new music," he says. "We will concentrate on pieces by live composers."

Jonathan Berger

Berger did most of his graduate work at CCRMA (Center for Computer Research in Music and Acoustics). "At CCRMA there's a very healthy exchange between scientists and creative artists," he notes. "It's an extraordinary place with extraordinary people."

Berger's composition *To the Lost History of Hope* for computer-generated tape was performed in September at the International Computer Music Conference in Venice. In January he will receive a $6,000 NEA grant to compose an opera for singers, instruments, and tape.

Even though much of Berger's work has been done at CCRMA, he composes more for performers than computers. Why? "It's always a surprise to see how performers will interpret my music. There's a certain element of risk in live music, as opposed to taped computer music. You never get the same thing twice. And I enjoy writing for specific performers and concerts."

Last year Berger taught music theory and composition at San Francisco State University and directed the computer-aided instruction program there.

He received his M.F.A. from the California Institute of the Arts in Valencia, where he studied composition with Mel Powell. His undergraduate work was done at the Rubin Academy of Music in Jerusalem.

"My wife and I hope to return to Jerusalem to live and work," says Berger. "It's the most beautiful city in the world."

In Israel, Berger won both the Aharoni Prize and the Sharett Prize for music composition.

Berger sees the combination of teaching and composing as ideal. "There's a lovely balance between composition and teaching. One is a completely self-centered act. . . the other is quite the opposite—a sharing of ideas. Composition is aimed at a specific goal in the future—performance of the piece. Teaching is always a source of immediate satisfaction."—**Julia Sommer**

Step-families sought by student

If the divorce rate continues at its present level, Americans will have about a 50 percent chance of living in a step-family—either in their families of origin or in their families of procreation.

Margaret Crosbie-Burnett, a Stanford doctoral student in counseling psychology, plans a dissertation on the short and long-term adjustments involved in becoming a stepfamily.

A board member of the Peninsula chapter of the Stepfamily Association of America, she believes that research may help individuals understand and cope with this stressful life change. It may also encourage desirable changes in social institutions, making them more responsive to the needs of stepfamilies.

She currently is looking for 75 step-father households in which the mother's children from a previous partner are seventh graders or older, and who are willing to spend about 60 minutes of family time filling out a questionnaire.

Overall findings will be shared with participants. Anonymity is assured. Interested stepfamilies should contact her at (415) 858-2777 or 858-0299 or 497-2113 (a message machine).

Crosbie-Burnett notes that 41 percent of U.S. marriages now are remarriages for the bride or groom or both. Since the majority of those remarrying have children from their first marriage and continue to procreate in subsequent marriages, there are now 15 million minor children—20 percent of all minors—living in households with at least one stepparent. This total does not include many households in which the couple has chosen not to legally marry.

Health plans open until Dec. 10

The annual health open enrollment period is November 10 to December 10. Each regular faculty and staff member was sent a packet of information about the new health plan rates which take effect January 1, 1983. Anyone who did not receive the information should call the Office of Benefits and Records.

Beginning November 10 the Office of Benefits and Records in the Old Pavilion has new hours 9 a.m. to 4:30 p.m., including the lunch hour.

A new telephone number has been added—7-1776. As of today, you may call the new number in addition to 7-1777 for questions about health coverage. Any questions about University insurance plans (health, dental, life, and disability) should be directed to these numbers.

Questions about retirement plans and the Tuition Grant Program should be directed to 7-1778.

Employees at SLAC may call the SLAC Benefits Office (ext. 2357).

Geothermal engineers plan workshop

The eighth Workshop on Geothermal Reservoir Engineering has been scheduled for Dec. 14-16 at Stanford, with about 40 technical papers accepted for presentation or publication.

Besides the papers, the Workshop will include three keynote presentations, a reception, and a banquet. Its aim is to provide for prompt and open reporting of progress and the exchange of ideas in geothermal reservoir engineering. Researchers, engineers, and managers are invited to attend.

All sessions will be held in the Large Group Instruction Room at CERAS; lunches will be served in Room 270-271, Tresidder Union. Registration is $125, which covers all sessions, luncheons, and the banquet. Registration deadline is Tuesday, Dec. 7. More information is available at 497-1218 or 497-4744.

Lyons wants award suggestions

Dean of Student Affairs James Lyons is seeking nominations for this year's Dean's Awards for Service to students who have made extraordinary contributions to Stanford and other students.

"The continued success of this award program hinges on Stanford people knowing about it, thinking of it when they encounter exceptional contributions of service on the part of Stanford students, and taking the time to send me a couple of paragraphs of information about the student and his or her work," Lyons stressed in an October memo.

Last year 12 students were honored for their contributions to ARLO, CROW, SCIRE, the women's community, Cowell Student Health Center, the advising program, the escort service, the *Daily*, ASSU, Black Student Union, International Center, athletics, teaching, orientation, and other areas.

Both graduate students and undergraduates in all parts of the University are eligible for nomination.

Questions or nominations should be directed to Lyons or to Sally Cole, program administrator, at 323 Old Union (ext. 7-4162).

Letters to the editor

More productivity, less pay no answer

Editor, *Campus Report*:

Many union members, including myself, are still hurting from the "unfair labor practice" strike against Stanford's management. Now it appears we must endure insults lodged in our own newspaper.

I refer to the article by Donald Stokes, based on an interview with Stanford economics Prof. John Pencavel.

Pencavel's suggestion for labor is to forego wage increases, enabling more company profits to ". . . be ploughed back into better machinery, so that productivity could be increased. . . ." This would then create ". . . bigger pies for tomorrow."

Since it logically follows that everyone would have more pie to eat, he goes on to include, "Labor and management in the U.S. are not natural enemies."

I wonder how Prof. Pencavel would respond if he were asked to forego an increase in his salary for more productivity?

To give a fair assessment of his answer, however, let's assume he no longer has a class of students to teach (since we must also assume that it is in the more efficient hands of advanced audio/visuals). Let us also say test questions and answers are also computerized, and class outlines are generalized and distributed nationally (eliminating the need for him to produce one).

Lesser paid assistants, including a host of programmers, operators, and clerical workers, etc., could handle the other details of the profession.

In lieu of these circumstances Pencavel might be inclined to answer in the same way that he says a "typical worker" would, "to hell with that, I want the money now." But if he were really astute, he might observe that management's interests might possibly conflict with his own.

My main question is, however, why does the article imply that investment, alone, will automatically cure the current crisis of productivity growth? In the first seven to eight years of the decline of productivity growth, actual high levels of investment did take place! This is not to mention that when investment declined in the 1970s, it did so *vis a vis* a low cost of borrowing funds and a high output potential for investment.

The simple solutions of America's one and only dynamic duo (Volcker/Regan) has plunged the world economy into the greatest crisis since the Depression of the '30s.

Now it looks as though workers are in for a further treat via the corporatist view. Of which, the weakened bargaining power of all unions and the logic of the Stokes and Pencavels seem to pave the way.

Let the buyer beware! The "pie" that Pencavel cleverly asks us to purchase with our wages of today (it's increasingly becoming the new/old system of extortion) is in reality a pie we must take a decreased portion of. Furthermore, this also means a higher social cost, aside from the wage cost.

I hate to be the spoiler of myths, but as of the last look, there is still no sign of the pie-in-the-sky. Should one develop and fall from the heavens, I would gladly move aside and invite Donald Stokes and John Pencavel to come and face up to it.

Staff, Forsythe Hall

Campaign for flat-rate income tax gathers more momentum

BY DONALD STOKES

The second stage has now been reached in the campaign to do away with the present chaotic system of income tax and to replace it with one much simpler and more effective.

When two Stanford scholars published their revolutionary scheme for a flat-rate tax last December in the *Wall Street Journal*, a storm of interest was aroused nationally.

Robert Hall and Alvin Rabushka, both senior fellows at Stanford's Hoover Institution, became overnight notables.

Their simple proposal—to abolish the crazy quilt of current income tax regulations and substitute a flat tax of 19 percent on every individual and corporation—became a national topic.

The plan was argued, attacked, and lauded in acres of newsprint and was the theme of countless airwave arguments.

The campaign will crest in several waves during the next few months. The U.S. Senate Finance Committee will debate the idea. A bipartisan move for its adoption has started. A bill based on the idea has been introduced by Sen. Dennis DeConcini (D.-Ariz.)

Next January a book by Hall and Rabushka, *Low Tax, Simple Tax, Flat Tax*, (McGraw-Hill) will detail the plan and its potential to bring order and fairness back into the income tax system. The book will stress the impetus that the flat-rate tax would give to the performance of the U.S. economy.

The newfound fame of the two authors came after each had established a professional reputation in other fields. Hall has become noted for his research in macroeconomics, dealing with such issues as anti-inflation policy, investment, unemployment, interest rates and the effects of stabilization policy; he has made a special study of labor turnover. Although Rabushka specializes in the domestic public policy areas of taxation, he is equally renowned for his studies of housing and aging, and also of the political economies of developing countries.

Support for the flat-tax idea has come in varying degrees from President Reagan who calls it "interesting"; Secretary of the Treasury Donald Regan, the Tax Foundation, Prof. Milton Friedman (also at Hoover) and the U.S. Chamber of Commerce.

Hall, who also is a professor of economics, said "there is a significant chance that consideration will be given to a thorough overhaul of our present tax system. It would be too optimistic to hope that our proposals will not be altered or adapted."

Was the recent progress in reducing tax rates a step in the right direction? "The main problems have not been attacked," he replied. "The tax system remains a disgrace. It is inordinately lengthy, filling volumes of tax codes, and is complicated by hundreds of credits, exemptions and special provisions.

"The complexities of the present system foster contempt for government, and make petty criminals out of a large fraction of the American people."

Would the new tax yield as much as the present one?

"We estimate that the simplified tax would yield over $300 billion a year, more than that raised by the present jungle of tax laws."

Asked whether the new-style tax would close the loopholes through which many rich taxpayers escape taxation, Hall replied: "It is too sweeping to say that the rich avoid their tax obligations. I don't like that word rich—it has the connotation of idlers, and there are extremely few of those in the U.S. today. One-third of all the tax revenues come from people who pay over $10,000 a year in taxes.

"It is true that a fraction of high-income people do evade taxes. They would not be able to do so under our proposed system.

"Middle-income taxpayers, defined as those with an adjusted gross income from $15,000 to $40,000 a year, pay the bulk of taxes. On average they pay from 20-25 percent of their income in taxes.

"We estimate that something like $90 billion a year in income escapes taxation by evasion. The income base to which current progressive rates are applied has steadily eroded over the years through a wide variety of exclusions, deductions and exemptions to the point where it now constitutes no more than half of total national income.

If $90 billion escapes taxation, that amount would go a long way to closing the present shortfall in our national budget.

—Robert Hall

"Just think of it. If $90 billion escape taxation, that amount would go a long way to closing the present shortfall in our national budget."

Would the new method eliminate double taxation?

"Certainly. At present, corporate profits are taxed (when earned by the firm) and then taxed again when sent to shareholders as dividends. Income is taxed when earned and then again when put into savings. A growing chorus of criticism contends that the current system attenuates individual incentives to work, save and invest."

How about tax shelters and other forms of evasion?

"There is widespread evidence of tax evasion on interest, dividends and other forms of income. Tax shelters are now a commonplace feature of the financial landscape.

"Estimates of the 'underground economy' range from several tens of billions to several hundred billion dollars. This means that the rest of us have to pay more in taxes to make up the difference. Today, marginal tax rates of 50 percent from the personal income tax, 46 from the corporate income tax and 14 percent from the payroll tax are converting Americans into tax avoiders and channeling their investments into tax shelters."

What are the basics of the flat-tax idea?

"We propose a simple income tax based on low marginal rates to replace the entire current system of separate tax rate schedules on corporate and individual income. The new tax would be a low, flat rate applied to all taxpayers, excluding the very poor, and to all types of income.

"It would be applied to a much larger tax base than at present, thus generating similar amounts of revenue as the current high-rate system with its exemptions and deductions. The simple flat rate would end 'bracket creep' which is caused by inflation pushing people into higher and higher tax brackets.

"It would largely minimize the penalty current law imposes on two-earner households ('the marriage penalty'). It would be stable, predictable, and cease further proliferation of a variety of tax credits used to attain social goals.

"Most important, it would restore the incentives to work, save and invest, thereby promoting growth and higher standards of living."

What are the principles on which his proposals are based?

"There are four. All income should be taxed only once, as close as possible to its source. All types of income should be taxed at the same rate. The poorest households should pay no income tax. The tax returns should be simple enough to fit on a postcard."

How would business be taxed?

"The tax would apply to all forms of business—corporate, partnership, professional, farm, rentals, and royalties. The base for the tax would be gross revenue less purchases of goods and services and compensation paid to employees.

"In addition, a capital recovery allowance would be deducted for investment in plants and equipment. No deductions for depreciation, interest or payments to owners are permitted. However, the self-employed may pay themselves salary in any amount they choose, provided they report it on the compensation tax form."

How would the new method replace the hodge-podge of investment incentives in the current system?

"We propose the use of straightforward first-year writeoff of all business investment, both in new and used plant and equipment."

Would there be special provisions for the poor?

"To limit the tax burden on poor families, we propose a set of personal allowances. The tax would be 19 percent in excess of personal allowances. Our proposed allowances are: Married couple $6,200;

Underspending of $1 million sought in effort to ease current budget woes

continued from page 1

natives has not been set.

Bacchetti also asked that departments survey University services they use or know about and "give us your constructive criticism and advice on where service reductions might be achieved in ways that do no more than minimal harm to your area and to the University.

"While it is clear that we must eliminate or sharply reduce some of the services we are accustomed to, it is also clear that it is much easier to assert the principle than to identify the likely candidate for reduction," he cautioned.

Bacchetti's letter, issued annually as a "protocol," provides background information and raises budgetary issues for discussion between budget officers and University vice-presidents and deans. This year's protocol meetings will be held between Nov. 15 and Dec. 10.

A third letter, about budget problems associated with facilities planning and capital projects, will be sent to appropriate units later this week.

Last March budget officers predicted a $1.5 million problem for 1983-84 and much larger potential deficits the following two years. One percent budget reductions for 1982-83 and 1983-84 were announced. By summer a "substantial fall off in the expected rate of sponsored research volume became apparent. Though dollar volume rose, it rose at considerably less than inflation and fell short by about $6 million from estimates," for the current year, Bacchetti explained.

Because of the lag between forecasting and budgeting, "the expenditure decisions for 1982-83 were in place before this decline in the rate of research increase was fully apparent; consequently, the gap for 1982-83 between income expectations and expenditure commitments is likely to be even higher than in the year just ended," Bacchetti said, explaining the need to request reductions in current spending.

"Though research volume and the related indirect cost recovery are the principal factors causing difficulty. . .utilities costs next year are expected to increase more than nine percent while inflation seems headed for six percent or lower. Financial aid continues to grow faster than the increase in student budgets in order to offset changes in federal and state student aid programs and to counteract the effects of the present recession on some students' families," Bacchetti said.

Hastorf said the $1 million holdback, divided roughly equally among all units, amounts to six-tenths of one percent of each department's operating budget.

The money returned would be one-time savings, not permanent base dollars, but the "holdbacks are, in one sense, an early start for planning cuts for next year," Hastorf said.

"We have reached a point where we need to think seriously about the reality of doing with less." Noting that budget adjustments at Stanford occur in cycles, Hastorf said that "to assume we can stall for a while and wait for things to get better is both unrealistic and dangerous. The problem will only be compounded if we avoid it."

Hastorf said he will seek specific commitments for current spending reductions from departments in December.

Noting that Stanford has experienced six years of balanced budgets despite a "sagging economy and in the shadow of strenuous efforts to balance the state and federal budgets by reducing support for higher education," Bacchetti warned that "we are in for a stretch of heavier weather in our University economy."

He cited the "fluidity of outside events, such as the capital markets, federal science policy, interest rates, state and federal financial aid policy, inflation rates, and unemployment," as areas of uncertainty that affect Stanford budgetarily.

In discussing the budget problems with departments, "we need to look ahead to 1984-85 and 1985-86 and not concentrate exclusively on 1983-84," Bacchetti said. "The opportunities available in any one year need to be seen in the context of a multi-year priority list to assure that limited resources are applied only to the highest of those priorities.

"Our problems are not greater than they were during the Budget Adjustment Program and Budget Equilibrium Program of 1969-77. The size of the gap in fact is less, but this is offset by the difficulty of budget cuts after two previous efforts," Bacchetti said.

"It is our collective determination to control rather than be controlled by financial circumstances."

—Karen Bartholomew

No injuries in HEPL Shield accident

The accidental fall of a 12-ton steel radiation shield at the Stanford High Energy Physics Laboratory Tuesday caused an estimated $100,000 in physical damage and delay of research on a new kind of laser.

There were no injuries.

The shield, one of many now being transferred from Stanford to Los Alamos, had been hoisted about 30 feet in the air by a built-in 40-ton crane at HEPL when a supporting bolt apparently sheared and the load fell to the floor.

Failure Analysis Associates has been asked to determine the cause.

The crane was operated by a Stanford employee. Sal Bravo Engineering and J&J Engineering were involved in moving the shielding. J&J riggers were less than 15 feet away when the shield fell. It was about eight inches thick, seven feet wide, and 20 feet long.

The principal damage was to equipment developed over the past five years for an experimental optical klystron. Prof. Richard Pantell is principal investigator on the project, which has been funded by the Office of Naval Research, National Science Foundation, Department of Energy and the Defense Department.

The accident could cause a two-to four-month delay in the research. Much of the apparatus involved was hand-made and took months to construct.

Income tax/

continued from page

single $3,800; single head of household $5,600; each dependent $750.

Why would the new tax help balance the national budget?

"Even if federal spending is at the high level projected in the Congressional Budget Office's baseline budget, a tax rate of 19 percent on all income would bring the federal deficit down to $75 billion by 1987.

"Immediate adoption of the simple tax would bring moderate deficits during the current recession, but would commit the nation to a balanced budget within three years, provided spending is kept at reasonable levels.

Would the new system affect interest rates?

"It would lower them. Rates would fall immediately because investors would require a lower rate of interest when they were no longer paying tax on the interest. In the medium run, the investment boom set off by the more favorable tax treatment of capital formation might bring interest rates part way back to their earlier level."

How would the proposals affect the huge underground economy?

"Low marginal tax rates will draw economic activities from the underground economy into the formal market, where they will be recorded as part of gross national product. Businesses and individuals will spend less time worrying about the tax consequences of their actions and will concentrate instead on earning higher incomes.

"Because of this we think that eventually the revenue needs of the government could be met by tax rates as low as 16 or 17 percent. Over the postwar period, cuts in marginal tax rates have coincided with episodes of vigorous economic growth and reduced inflation in the U.S."

What about charitable deductions?

"None would be allowed under our plan. We do not believe that current tax incentives are a major part of the motivation to make contributions to community, religious and other organizations. On balance, the public would be better off by paying a little more in personal contributions and at the same time save taxes by blocking the abuses by which taxpayers avoid taxes.

"There is little merit in public subsidy for organizations whose success in raising funds depends on tax deductibility rather than the intrinsic merit of their activities."

Why don't you make any allowance for medical costs, as the present system does?

"Virtually the entire U.S. population is now covered by medical insurance, Medicare, or medical benefits through welfare. The medical deduction under the present tax is a source of many abuses, including the deduction of swimming pools and other home improvements as medical expenses. Few families would suffer, and the overwhelming majority would gain by closing off this source of abuse."

Similarly for moving costs?

"Moving costs are only one of hundreds of costs incurred by taxpayers in order to earn an income. It is inconsistent to permit deduction of moving costs when costs of commuting, purchase of special clothing and other employment costs cannot be deducted."

Some critics say that the flat-rate tax would be a windfall for the rich?

"Taxation of families with high incomes and few deductions would be reduced dramatically under the new system. On the other hand, taxes paid by those who now take advantage of the almost unlimited scope for reducing or postponing taxes through tax shelters and other gimmicks will rise a great deal.

"The simple tax would be a windfall to hard workers and a loss to those who have concentrated on avoiding tax."

But surely rich people can live off interest and capital gains income and thereby pay no taxes?

"Not at all. In effect, the simple tax puts the equivalent of a witholding tax on interest and capital gains. The business tax applies to business income before it is paid out as interest, or if it is retained in the business and generates capital gains for stockholders.

"The interest, dividends and capital gains received by the rich have already been taxed under the business tax. The rich cannot escape the tax."

* * *

Hall was born in Palo Alto 39 years ago, and was educated at UC-Berkeley and MIT. He gained his doctorate at the latter and was a professor of economics there till 1974, when he came to Stanford.

He has advised a number of government agencies on national economic policy, including the Treasury Department and the Federal Reserve Board. He served on President-elect Reagan's Task Force on Inflation Policy, and is a member of the National Presidential Advisory Committee on Productivity.

He also serves as director of the Research Program on Economic Fluctuations of the National Bureau of Economic Research, an interuniversity research organization. He is chairman of the National Bureau's Committee on Business Cycle Dating, which maintains the semi-official chronology of the U.S. business cycle.

In view of the last-named position, Hall was asked what he saw ahead economically in the next 12 months.

"In view of my official position, I have to be cautious. I can say as an individual that I agree with the consensus of most economists, that the recession will end within 12 months, and may have already started to do so. Real output, inflation adjusted, will begin to grow, unemployment will remain high, and may not fall below eight percent for about a year. Inflation, which has now dropped to about three and a half percent, will fall some more."

Pianist Emanuel Ax leads a master class

'It's very inspiring to hear such a fine artist talk about music'

"What happens in your brain is more important than what happens in your hands."
—Emanuel Ax, concert pianist

Emanuel Ax, who owns two of the most valuable hands in the world of music, got up from his front row seat in Kresge Auditorium, braced those hands on the three-foot high stage, and vaulted easily up onto it.

Someone in the audience gasped, thinking of a broken finger or sprained wrist.

But Ax, who plays tennis when he isn't hearing applause and cheers at his 85-or-so annual concerts around the world as one of the great pianists of the age, never gave the leap a second thought.

On the stage, seated at the concert grand, was Kay Bedenbaugh, one of four young pianists playing for him in a master class. Bedenbaugh, just beginning studies for her doctor of musical arts at Stanford, widened her eyes in shock as Ax landed beside her piano bench.

She had just played Claude Debussy's L'Isle Joyeuse, and she instantly relaxed as he grinned and said, "Very good."

Concert pianist Emanuel Ax gives Kay Bedenbaugh pointers during master class.

Lively Arts

Master classes are offered as part of Stanford's Lively Arts with co-sponsorship of the Music Department and the Music Guild. They are designed to bring outstanding professionals together with budding young performers in an informal setting, and before an audience whose ticket fees go to the Music Guild's scholarship fund. The audience always includes many teachers.

"Past classes have been given by artists including Janos Starker, cello; Elly Ameling, voice; Barry Tuckwell, French horn; Narcisco Yepes, guitar; and Michael Tree, violist," said Sally Mentzer, community outreach coordinator for the Lively Arts. Participants in each class are auditioned by Music Department faculty and other teachers.

"It offers the students an opportunity to perform before an audience, and then receive about a half hour of very individual critiquing by a seasoned performer," said Mentzer.

Naomi Sparrow, senior lecturer in piano in the Music Department, a faculty member for 12 years, auditioned 11 pianists (applicants do not have to be Stanford students) for the four openings in Ax's upcoming class. Joining her were two Palo Alto piano teachers, Sara Doniach and Corinne Barkan.

"We look for pianists with poise, an authoritative approach, control, conviction, and technical achievement, and sensitivity to the subtleties of the music," said Sparrow.

"The student who applies presumably is headed for a professional career. A master teacher usually has a well-defined ability to describe what's necessary to make a performance, and can offer inspiration through close contact. The student already has learned the basics from her or his own teacher."

Bedenbaugh wanted to play the piano "like my older sister when I was four, but my parents made me wait until I was six."

She went to the High School of Fine Arts in her native Birmingham, Ala.; graduated as a magna cum laude music major from Birmingham Southern University; earned a master's in music at Juilliard, where she studied with William Masselos; and then won a one-year Rotary Club Fellowship to the Royal Academy of Music in London.

Her goal is to be a concert pianist, but to combine that with university teaching, which is why she applied to Stanford's D.M.A. program.

"Stanford has such an outstanding reputation," she said, "with Adolph Baller as my teacher, and its excellent program in performance practice, teaching how a piece was performed in its own time."

She was looking forward to meeting Ax, because "I've heard him in London and New York, and he is one of my favorite pianists. It's very inspiring to hear such a fine artist talk about music."

Informal and relaxed

The evening of the master class found Ax relaxed and informal, after just attending "my first live football game."

"The most important thing about these classes is for the participants to have a good time, and perform a little," he said while waiting for them—and the eventual audience of 100 or so—to arrive.

"It gives the students a chance to meet people who perform for a living, and to talk about practical problems relating to performance. When I'm performing, I'm aware of certain things: play louder or softer, or not too fast, because then you can't be heard in larger halls. Teachers know these things, but perhaps they are not touched on during lessons.

"The bad part is that people will work with a teacher week after week, and then I waltz in with a different view, not negative, but different.

"Certain things are pointed out by every teacher, and everyone forgets them. I do, too. Take Jimmy Connors, for example. Why does he so often hit approach shots into the net? He knows better, of course, but he forgets to swing through, that's why."

Ax looked over the list of the four performers he would meet in a few moments and noted how many of their teachers he knew ("Adolph Baller is a terrific musician," he said). The next afternoon, Ax would present his own performance before a large audience in Memorial Auditorium.

Now it was Bedenbaugh's turn to walk up onto the stage for her six-minute Debussy piece. Ax sat in a front row seat, about 15 feet from her, with the score in his hands.

As she played, he visibly was playing it mentally. His head tossed, his hands "played" the notes, his body movement was constant. When she finished, he led the applause (as he did for each performer), and it was loud and long.

Then he leaped up beside Bedenbaugh, put the score on the rack, and started talking over portions of it. Occasionally he sat down and played a phrase or two. Then she played it.

As Bedenbaugh played, Ax became a part of the music, singing silently—sometimes audibly—and directing with one arm. He really was playing it right along with her.

She played a particularly melodic and romantic section. "In terms of the whole piece," said Ax, "that's too loud. Do the opposite of Schubert and Beethoven; you *don't* want to project."

Then he hesitated, looked thoughtful for a full five seconds as he reached for more descriptive words, grinned, shook his head, and said, "I refuse to discuss this piece in sensual terms. This is really (he hesitated, grinned again) ecstatic."

"Fine role model"

When he concluded his session with Bedenbaugh, he said, "Everything I said may be totally wrong, but I know one thing: you have to think of this as a totality, think about its total atmosphere."

When she left the stage, Kay Bedenbaugh, who has performed in Royal Albert Hall and looks the total professional when she plays, seemed to glow with joy.

"He's so gentle and modest," she said. "The Debussy is a work I know, so he doesn't have to tell me how to play notes, but in his total conception of the piece, he's very informative. I agree with what he said; he has a different way of thinking about the piece, and would be a wonderful teacher to study with."

Naomi Sparrow summed up the evening:

"The master teacher tries to pick out points that will make a difference in a performance, not focus on specific techniques. The psychological impact of meeting and talking with a master teacher is great; an international reputation makes for a fine role model."

—Harry Press

Medical Center MEMO

A formal contract providing for the consolidation of Children's Hospital at Stanford and the pediatric facilities of Stanford University Hospital was signed Thursday night, Nov. 4, during ceremonies at Stanford's Buck House. From left are Kenneth Sayre, chairman of the CHAS board; Donald Kennedy, president of Stanford University; and Lawrence G. Crowley, president of SUH and vice president for medical affairs at Stanford. The new facility, to be a separate building adjacent to SUH, is expected to be completed in May, 1987.

Contract signed for children's med center

A formal agreement consolidating Children's Hospital at Stanford (CHAS) and the pediatric facilities of Stanford University Hospital (SUH) was signed Thursday night, Nov. 4, at ceremonies attended by the new organization's recently chosen board of directors.

"Just like a marriage courtship, we have spent the past year getting to know each other's needs and expectations, and we are now joyously celebrating a bonding of our goals and interests," said Dr. Lawrence G. Crowley, chairman of the new 10-member board and president of SUH.

"And like a marriage, we must marshal the groundwork and bond thus far achieved to forge an ongoing relationship," added Crowley, who also serves as vice president for medical affairs at Stanford University.

"We will now get on with the business of taking two dynamic institutions and creating a new entity which is even greater than the sum of its individual parts," said Kenneth H. Sayre of Menlo Park, chairman of the original CHAS board and member of the new CHAS board which will now guide the consolidation through final planning and construction.

The $40 million hospital is to be a separate building physically attached to SUH and ready for occupancy by a target date of May 1987. The project is being built in conjunction with Stanford Hospital's Modernization Plan.

The formal contract was signed by Sayre and Crowley, representing the two hospitals, and by Donald Kennedy, president of Stanford University, which operates SUH as a wholly-owned subsidiary. The agreement creates a new corporation to operate the consolidated children's medical center and mandates the new board to begin planning for construction and other details.

Five of the new CHAS board members were selected by and from SUH's board, while five others were chosen from CHAS' current board, which will continue to operate the existing hospital until it is moved to the new facility. The existing CHAS and SUH boards will serve as the parent governing bodies of new CHAS, Crowley and Sayre said.

Members of the new board from CHAS include Charles A. Anderson, Menlo Park, formerly chief executive officer of SRI International; Birt Harvey, a Palo Alto pediatrician; Shirley Oneal, San Jose, president of the CHAS association of hospital auxiliaries; Lucile Packard, Los Altos Hills, vice chairman of the current CHAS board; and Sayre, a vice president of Kidder, Peabody and Co., San Francisco.

SUH's members include, in addition to Crowley, Conrad F. Gullixson, a Palo Alto attorney, former city councilman and past president of SUH's board; Linda Meier, Atherton, an active Stanford alumna and community leader; Dominick P. Purpura, dean of the Stanford University Medical School; and Frank Roberts, senior partner with the San Francisco law firm of Pillsbury, Madison and Sutro and former SUH board president. Meier and Roberts had also served on the old CHAS board until they resigned last month to be among SUH's appointees to the new CHAS board.

In addition to regular members, each originating board appointed two alternates.

CHAS' alternates are Mary Elizabeth Kendrick of Atherton, a community leader; and Lawrence R. McDonnell of Palo Alto, retired vice president of public information for Pacific Gas and Electric Co.

SUH appointed William F. Massy, Stanford's vice president for business and finance; and David J. Stone, a Palo Alto businessman.

The contract approved during Thursday's ceremony stipulates that Crowley, as vice president for medical affairs, will serve as ex officio chairman until the new hospital is occupied.

Most provisions of the contract were announced in July when both parent boards signed an agreement in principle to consolidate.

Formal planning for a single children's medical center was begun by both boards in November 1981, but informal discussions have been occurring for many years. Central issues included rising costs, concerns about duplication of services, as well as trends in pediatric care, which resulted in attracting to Stanford the more difficult-to-treat cases and the need for a comprehensive approach to the care of children.

About 2,500 patients yearly must be shuttled one mile across a busy thoroughfare between the hospitals for specialized treatment at SUH.

The new facility will consolidate the 60 beds of CHAS and the 44 pediatric acute medical-surgical and pediatric intensive care beds of SUH. The new facility also will house the Stanford-Children's Ambulatory Care Center, which provides 27 separate clinic services, including such specialties as cardiology, birth defects, oncology and child psychiatry.

The new children's medical center will continue to provide inpatient services in the 15 specialties now offered by both hospitals.

The existing CHAS facility at 520 Willow Road in Palo Alto will continue to operate until the new building is completed. The consolidation must now pass through the review process of state and local agencies. —**Mike Goodkind**

Two more heart-lung transplants

Philip McGrath, who doctors said faced death within a few months, became the second heart-lung transplant patient at Stanford within four days.

The 22-year-old Islip, N.Y., man was reported in critical but stable condition following the five-hour operation performed Tuesday by Dr. Stuart Jamieson and five colleagues from the Department of Cardiovascular Surgery.

The operation was the ninth heart-lung procedure performed since Stanford began the program in March 1980.

Jamieson said the transplant was performed without complications, offering the former college student a potential reprieve from the death sentence imposed by his condition, known as a ventricular septal defect (VSD).

The abnormality was the same which led to last Friday's heart-lung transplant for Ronald Grunden, 40, of Ventura, Calif.

Workers reject Local 715 in union election

Service and maintenance workers at Stanford University Hospital voted against representation by Local 715 of the Service Employees International Union AFL-CIO.

The final tally Saturday night showed a vote of 778 against, 253 in favor, with 22 ballots void or challenged. Approximately 1,150 employees were eligible to vote, showing about a 95 percent turnout during National Labor Relations Board voting Friday and Saturday.

"We are very pleased with the results," said Dan Robinson, SUH assistant director of personnel and manager of labor relations. "We feel that it is a strong vote of confidence. We will continue to live up to this very strong vote of confidence which our fellow workers have shown."

An NLRB representative said the election would be certified after 10 days unless either the employer or the union filed objections.

Michael Baratz, executive secretary of Local 715, said he is unsure whether the group will file objections to the results.

"We'll talk about it," he said.

Workers eligible to vote included a variety of job categories, including nursing assistants, unit service assistants, housekeeping and dietary workers and maintenance employees.

No employees currently are represented by Local 715 at the Hospital, a wholly-owned non-profit subsidiary corporation of Stanford University.

A nonaffiliated union, the Committee for the Recognition of Nursing Achievement (CRONA), represents about 1,250 registered nurses and is the only union currently representing employees at the Hospital.

At the University, a Local 715 contract covers a bargaining unit of 1,350 workers.

Raffin, Young to discuss on t.v. the right to die

Case: A 25-year-old man lies comatose in an intensive care unit of a hospital after being critically injured in a car accident. Not only will he never be able to resume his formerly active lifestyle, but his basic life functions are being sustained only with the aid of machines.

Dilemma: Should the man be kept on life support systems indefinitely, or should he be taken off them and allowed to die?

With the advent of modern medical technology and intensive care units, the question of the right to die is coming up more frequently. Stanford's Dr. Thomas Raffin, director of respiratory therapy and asistant chief of medicine; Dr. Ernle Young, Stanford chaplain; and Attorney Morris Abram, chairman of the President's Council on Bioethics, discuss this topic on the Nov. 25 segment of "Over Easy," a Public Broadcasting System television talk show. It will be aired at 7 p.m. that day, and again on Nov. 26 at noon.

"If a patient is on life support systems, we go by these guidelines: cause him no harm, restore him to health, and relieve suffering," Raffin said. "Our goals are either to save the patient and restore the salvagable functions, or to help him die a dignified death."

Young added what he believes should be another guideline: patient autonomy. "The patient should be able to determine what he'd like the quality of his life to be," he said.

"Technology has accelerated, but the ability to handle the technology at a moral level has often lagged behind," he added.

Often, he explained, family members are torn between the emotion of wanting to keep their relative alive, regardless of his condition, and the practicality of doing what is medically, humanely, and financially the best option.

Reaching these decisions often causes conflicts between family members and

Thomas Raffin

Ernle Young

physicians. Chaplains, social workers, and other trained professionals are especially helpful in these circumstances, all three guests agreed.

One way to avoid forcing family members to make these decisions, they advocated, is for individuals to discuss the options with their family members in advance. Individuals can also sign a "living will," available through the Society For The Right To Die. "The document is not legal, but it does express the person's wishes," Young said.

"Over Easy" is a national daily, half-hour talk show. In its sixth season, it is aired locally on KQED, San Francisco. Hosts Mary Martin and Jim Hartz feature guests who are authorities in subjects pertinent to growing, changing adults.

—Shirley Kraus

Billed as unique in the West. . .

Psychiatry has new facility

A new facility for neurochemical research has been dedicated at the Stanford University School of Medicine.

The new facility, established as part of the Nancy Pritzker Laboratory of Behavioral Neurochemistry, was dedicated to the memory of Jack D. and Sophie A. Pasarow, parents of the major donor to the project.

The new Pasarow Analytical Neurochemistry Facility has equipment and expertise which are unique in the western United States, said Dr. Jack Barchas, director of the Nancy Pritzker Laboratory.

The dedication ceremony launched the new facility and thanked the donors who made a fund drive for the refurbishing and remodeling of the Nancy Pritzker Laboratory successful.

According to Barchas, the Pasarow Facility is intended to support neurochemical research, which requires the detection and measurement of neurotransmitters—chemicals that transmit information from one nerve cell to another. For this purpose the facility has equipment which can identify substances present in minute amounts and which will aid studies in severe mental disorders in adults and children. The equipment includes a new top of the line Hewlett Packard mass spectrometer.

Dr. Dominick Purpura, dean of the Medical School, said that recent developments in psychiatry are permitting the field to move with effectiveness toward an understanding of the critical problems of mental illness which affect millions of people.

The Pasarow Facility comprises one of five divisions of the Nancy Pritzker Laboratory. The others are peptide chemistry, biochemical neuroanatomy, biochemical regulation, and behavioral neurochemistry.

The remodeling and refurbishing of the Nancy Pritzker Laboratory and the establishment of its Pasarow Facility were made possible by a combination of private donors, private foundations, and government sources. Besides Claire and Robert J. Pasarow of Southern California, other private donors included: Moshe and Margaret Alafi of Berkeley, Bill and Diane Bridgford of Fullerton, John and Marjorie Hines of Chicago, Peggy and Albert Orschel of Chicago, Peter and Barbara Pande of Palo Alto, Al and Edie Shansky of Hillsborough, and Garland and Pauline Sinow of Long Beach.

"We are deeply appreciative of the gracious help and key role the donors had in providing for this important research unit," stated Barchas.

The ceremony took place five years after the opening of the Nancy Pritzker Laboratory, established with a gift from the Pritzker Foundation. Several foundations including the Grant, MacArthur, McGraw, Norris, and Pritzker, were important in the current remodeling and refurbishing effort.

In addition, government support was received from the National Institute of Mental Health and the Office of Naval Research. "Individuals, foundations, and government are all important in research on mental illness, where there has been so little tradition of support," noted Barchas, Nancy Friend Pritzker Professor and associate chairman of psychiatry. "Each sector performed a needed role in this three-year $1,000,000 fund drive."

Dr. Kym Faull, senior research associate in psychiatry, will head the Pasarow Facility. Said Barchas, "Dr. Faull is one of the leading experts in this country on the application of mass spectrometry to the analysis of neurotransmitters and their metabolites."

"We are delighted to be in the remodeled space," he concluded, "and the work is already going full speed ahead."

This year's McCormick Lecture to feature Professor Rodin on obesity

"Obesity: Why the Losing Battle?" is the topic of the tenth annual Katharine D. McCormick Distinguished Lecture to be held at Stanford Medical Center 5 p.m. Thursday, Nov. 18.

The speaker, Dr. Judith Rodin, is a leader and respected investigator in the field of behavioral medicine. She is presently a professor of psychology and psychiatry at Yale University.

Rodin's approach to the problem of obesity has been largely responsible for current methods of treating and understanding this major medical problem. Using rigorous methodology, she demonstrated the importance of behavior in understanding the pathophysiology of obesity.

Recently Rodin studied aging using similar methods and showed dramatic effects on the aged when behavioral interventions were introduced. Her work has been of fundamental theoretical importance as well as providing insights into specific medical issues.

Rodin's most recent honor is election to the Institute of Medicine of the National Academy of Sciences. She has served on a variety of editorial boards and professional societies, been the recipient of

Judith Rodin

numerous honors and professional recognitions, and published widely.

Rodin graduated from the University of Pennsylvania in 1966, received her Ph.D. from Columbia University in 1970, and continued her education as a postdoctoral fellow at the University of California, Irvine, in 1971. She joined the faculty of New York University in 1970, and transferred to Yale in 1972.

The McCormick Lectureship honors Katharine Dexter McCormick, who donated $5 million to Stanford Medical School in 1969 with the expressed wish that it be used "for the encouragement and assistance of women pursuing the study of medicine, in teaching medicine and in engaging in medical research."

Katharine McCormick was a co-founder of the League of Women Voters and a vigorous champion of women's rights.

Previous McCormick speakers at Stanford include Drs. Marian Koshland, Maria New, Rose Payne, Rita Levi-Montalcini, Elizabeth Hay, Barbara Korsch, Rosalyn Yalow, Helen Ranney, and Mary Ellen Avery.

Rodin's lecture will be open to the public though specifically addressed to the medical community. (Continuing medical education credit is available.) The presentation will take place in the Fairchild Auditorium, with a reception in the lobby to follow. For further information call 497-6038.

Women's forum

An informal discussion of particular interest to women in medicine will be held by Dr. Rodin in the Sterling Conference Room, Dean's office, M121, at 4 p.m. Wednesday, Nov. 17. Women students, staff and faculty are invited to attend. Refreshments will be served.

Auxiliary members helped some hospitalized patients who couldn't get to the polls vote last week on election day. This is a traditional activity in which Auxiliary members distribute ballots, then collect and deliver them to the polls, working together with the League of Women Voters. Here, patient Althea Prack sorts through her voting materials with assistance from Del Winslow.

Transplants. . .

continued from page 10

Jamieson said Grunden was making excellent progress and has been able to sit up in a chair and eat solid foods. He was listed in satisfactory condition Tuesday.

"I think we have been able to offer both Mr. McGrath and Mr. Grunden at least a fighting chance for productive lives," said Jamieson, an assistant professor of cardiovascular surgery who directs the heart-lung transplant program.

Both McGrath and Grunden previously had led active lives as long as their conditions permitted. McGrath had attended Suffolk Community College on his native Long Island until September 1980, when he withdrew for medical reasons. Grunden had worked for a Southern California newspaper as a computer technician and typesetter until ill health forced him to leave in February 1980.

VSD sufferers are born with a hole between the left and right chambers of their heart. Surgeons currently can correct the hole in infants, but that procedure was unavailable to McGrath and Grunden.

When left uncorrected, the hole allows blood to flow between the chambers of the heart, causing too much blood to enter the blood vessels in the lungs.

The overcirculation causes pressure to increase in the pulmonary arteries that the right ventricle of the heart is unable to overcome.

Therefore, both the heart and lungs become damaged over many years, and a heart-lung transplant becomes the only viable alternative to death.

VSD is one of two common conditions which currently is correctable only by the double transplant operation. The other condition is pulmonary hypertension, in which the blood vessels in the lungs constrict for reasons not yet learned. In this condition, blood cannot flow effectively through the lungs, creating a backlog which ultimately damages the heart.

Since the recipients and donors must be matched by size and also by blood type and tissue type, three recipients at Stanford currently are waiting, ensuring that if a heart and lungs become available, a matching recipient will be ready.

"There are literally hundreds of people who could benefit from this operation, but the difficulty in obtaining donors has meant nearly all of these will die before any real chance of surgery," Jamieson said.

Although several of the nine heart-lung transplants, and many of the 244 heart-only transplants performed at Stanford have returned to active, even athletic lives, they must take medication for the rest of their lives to minimize the impact of rejection, the body's natural tendency to fight off foreign tissue.

The discovery of Cyclosporine (formerly called Cyclosporin A) was the impetus that allowed the heart-lung procedure to be revived last year.

The new drug overcomes problems which caused the three earlier attempts in New York, South Africa, and Texas, to result in failure. Cyclosporine, used on both heart and heart-lung transplant patients at Stanford since December 1980, is more effective than older immunosuppressives at fighting rejection while minimizing the possibility of infection. But more importantly, it allows the windpipe to heal and the lungs to function.

Four of the first seven Stanford transplant patients have returned to active lives.

Three of the patients died, all within a month of their surgeries. Doctors said two patients died of complications encountered because of previous heart surgeries, while another death was attributed to kidney failure, resulting at least in part to exhaustion rendered by a five-year battle against pulmonary hypertension.

SCI welcomes Smith as guest speaker

Stanford Community of Internists (SCI) is sponsoring a one-day symposium featuring Lloyd H. Smith, Jr., M.D., professor and chairman of the department of medicine at the University of California, San Francisco, Nov. 18.

Smith is scheduled to present the Department of Medicine's Grand Rounds lecture—"Pathogenesis and Treatment of Gout"—in Fairchild Auditorium at 8:30 a.m.

He will also lead a lunchtime conference with housestaff and students on "Urolithiasis." The public is welcome at both events.

A dinner is scheduled for members of SCI later that evening, at which Smith will lead an informal discussion on "Reflections of Academic Medicine."

Smith is also physician-in-chief of the Medical Service at University of California Hospitals, San Francisco. He has been a visiting professor at the University of Geneva (Switzerland), Pahlavi University (Iran), the University of Sydney, and the University of Auckland (Australia). He serves on numerous professional and editorial boards, and is the author of at least six books and 89 journal articles.

SCI, formed in 1979, is an organization of community and Stanford University Medical School faculty internists. With about 135 members, the group sponsors a number of educational events each year. For further information, call Sally Mixer at 497-5454.

Drachman launches new lectureship

Dr. Daniel Drachman, a renowned researcher in the causes of the neuromuscular disease "myasthenia gravis," will address Stanford community members next week in the first annual lecture on the causes and treatments for the disease.

The lectureship is sponsored by the Department of Neurology, with a grant from the H.S. Kittredge Research Fund.

Open to the public, the presentation will be held in room M104 of the Stanford University Medical School, 5 p.m. Thursday, Nov. 18.

Double vision, weakness that gets worse as the day wears on, and sometimes fatal paralysis are symptoms of the disorder that affects between five and ten thousand persons in the United States each year. The disease seems to stem from malfunctions in an overzealous immune system at neuromuscular junctions, places in the body where nerve and muscle meet.

Drachman, a professor of neurology at Johns Hopkins University in Baltimore, Maryland, has been a leader in understanding the disease for the last 15 years, according to Dr. Lawrence Steinman, assistant professor of neurology at Stanford.

"It was Drachman who really showed how the receptor for acetylcholine (a chemical messenger at the nerve junction) was involved in the development of myasthenia gravis," Steinman said. "He showed that when antibody binds to the receptor, the receptor is shed and you lose the ability of the muscle to respond to the nerve impulse."

Florence and H.S. Kittredge, long-time residents of the Santa Clara Valley, donated "a generous grant" to Stanford University Medical Center in 1972 for studies of the causes, treatments, and potential cures for myasthenia gravis, Steinman said.

A portion of the grant was set aside in 1982 to fund the neurology lectureship which is scheduled to bring to Stanford each year "people of national and international reputations who are making direct contributions to clinical treatments of the disease."

Popular diets newly critiqued

The Weight Watchers Program is the only one recommended in a recent critique of 14 diet plans.

Popular Diets—How They Rate is available through the Department of Dietetics. The 56-page booklet was prepared by the Los Angeles District of the California Dietetic Association and includes a description, rationale, analysis and conclusion for each of the 14 diets covered.

Some of the popular diets reviewed in the book are: The Beverly Hills Diet, The Complete Scarsdale Diet, The Last Chance Diet, Dr. Frank's No Aging Diet, The Pritikin Program for Diet and Exercise, The Save Your Life Diet, and New Hope for the Arthritic, among others.

The booklet sells for $5 per copy. Order forms are available at Dietetics in C108 or by calling 497-6904.

Medical Center Calendar

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservation required. Call 497-6389.

PUBLIC EVENTS

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

WEDNESDAY, NOVEMBER 10

Div. of Hematology Conference: "Studies on the *In Vitro* Micro Environment in Human Long-Term Marrow Cultures"—Dr. Jack Singer. Noon, S102d.

Basic Science Research Colloquium: "Cell to Cell Interactions in Development"—Dr. Dale Kaiser. 5 p.m., Fairchild Auditorium.

THURSDAY, NOVEMBER 11

Dept. of Biochemistry Seminar: "Prediction of Protein Secondary Structure"—Dr. Bob Abarbanell (UCSF). Noon, M316.

Dept. of Medicine Grand Rounds: "Pathophysiology of Multiple Sclerosis"—Dr. Stephen G. Waxman (Palo Alto Veterans Administration Medical Center). 8:30 a.m., Fairchild Auditorium.

FRIDAY, NOVEMBER 12

Child Psychiatry Grand Rounds: "Mothers and Babies—The Origins of Communication"—Dr. Daniel Stern (Cornell). 11 a.m. till 12:15 p.m., Children's Hospital at Stanford, Faber Auditorium.

Dept. of Dermatology Seminar: "Annular Lesions"—Dr. Lobitz. 8 a.m., Dermatology Library, R136.

Dept. of Gynecology and Obstetrics Grand Rounds: "Current Status of Radiosensitizers"—Dr. Norman Coleman. 8 a.m., A336.

Dept. of Neurology Seminar: "Signaling Through Gap Junction"—Dr. Michael Bennett (Albert Einstein School of Medicine). 4 p.m., C364.

Dept. of Pediatrics Grand Rounds: "Pyloric Stenosis"—Drs. Barbara Carroll and Bruce Parker. 8 a.m., M106.

NOVEMBER 13 AND 14

Div. of Child Psychiatry and Children's Hospital at Stanford, and the Extension Division of the San Francisco Psychoanalytic Institute Second Annual Symposium on Advances in Developmental Knowledge: "Infancy: Research Advances and Clinical Implications." For program information, call 563-5815.

MONDAY, NOVEMBER 15

Div. of Otolaryngology/Head and Neck Surgery Resident Lecture Series: "Impedance as a Clinical Tool"—Earl D. Schubert, Ph.D. 7:30 a.m. R117.

TUESDAY, NOVEMBER 16

Dept. of Dermatology Grand Rounds: "Leukotrienes in the Pathogenesis of Psoriasis"—Dr. Dowd. 10 a.m., Dermatology Library, R136.

Dept. of Biochemistry Colloquium: "Specific DNA Binding and Transcriptional Regulation by Glucocorticoid Receptors"—Keith Yamamoto (UCSF). Noon, M114.

Progress in Medicine Lecture Series on Sexually Transmitted Herpesviruses: "Risks for Fetuses and Infants in Contact with Infected Adults"—Dr. Anne S. Yeager. 7:30 p.m., Fairchild Auditorium. The public is welcome.

WEDNESDAY, NOVEMBER 17

Div. of Orthopedic Surgery Grand Rounds: "Monteggia and Galeazzi Fractures"—Dr. Frederick Reckling (Univ. of Kansas). 8:30 a.m., M114.

Calendar items must be received in the Office of Public Events, 800 Welch Road, Suite 221, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. For information call 497-6389.

Medical Alumni Day: E.T.s and kids

Medical staff, faculty, and students are invited to join Medical School alumni Nov. 19, at the Big Game Medical Alumni Meeting featuring E.T.s and kids.

The program consists of a morning scientific session, a 12:30 luncheon, and an afternoon keynote address at 1:45 p.m. entitled "Extraterrestrial Life" by Dr. John Billingham, chief of the Extraterrestrial Research Division, NASA Ames Research Center in Mountain View.

"The Coming of Age, A Pediatric Perspective" is the subject of the morning program to begin at 9 a.m., and is acceptable for continuing medical education credit. A certificate of attendance is available on request.

Speakers include Dr. Merton Bernfield, professor of pediatrics and Joseph Knotts Knowles Professor of Biology, who will discuss "Lessons from Embryos: a New Intercellular Biology."

Dr. David Stevenson, assistant professor of pediatrics and associate director of the intensive care nursery, will speak on "Bigger is not Always Better—a Neonatology Update."

Dr. Paul Pitlick, associate professor of pediatrics (clinical) will speak on "Application of Echocardiography in Congenital Cardiac Defects," and Dr. Iris Litt, associate professor of pediatrics and director of adolescent medicine will give a lecture entitled "It was the Best of Times. . .the Worst of Times, Adolescent Health and Well-Being."

Sessions will be held at Tresidder Union on the University campus.

...News Notes...

The Auxiliary has updated its Visitor Information *guide for the Hospital, announced Auxiliary president Dee Gaynor. It was revised by Joyce Vincenti, an Auxiliary Board member, chair of surgery reception, and patient services volunteer.*

The guides contain general information about the Hospital, visiting rules, miscellaneous services, area transportation, accommodations, agencies, restaurants, churches and synagogues, local businesses, recreation, and more.

They are kept at all reception desks in the Hospital, patient information, Clinics information, the Chaplaincy, the oncology/radiation therapy clinics, Social Services, Community Relations, Administration, Hoover information, and the Emergency Department.

* * * *

Emblazoned shirts for Stanford medical students and faculty are still available through the Medical Student Association and the Office of Student Affairs. A variety of styles are being displayed on the wall of the medical student lounge, opposite room M105, where order forms are available.

An Oct. 8 ordering deadline was extended at least through the first few weeks of November to allow persons to place holiday orders, said Diane Winkle, director of the Student Affairs Office.

Six styles are being offered, ranging in price from $4.30 for a child's tan standard T-shirt with brown logo to $7.80 for golf/tennis shirts.

* * * *

A streamlined Press Code for the Medical Center is being distributed by the News Bureau as a guide for all personnel who have contact with the news media.

Copies of the code will soon be available at all nursing stations in the Hospital. Physicians or other personnel who wish copies of the guidelines or have questions should call Mike Goodkind at the News Bureau, 497-6911.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Wanted: Research Volunteers

About 30 active, healthy, male volunteers over 60 are needed to participate in a study at Stanford University Medical School on the relationship between metabolism and physical conditioning.

Dr. Mark Rosenthal of the Division of Gerontology has been researching glucose metabolism in the elderly. His findings, published in last month's issue of the *Journal of the American Geriatric Society*, indicate that the so-called "glucose intolerance of the elderly" happens only in certain individuals.

"While other researchers claim that poorer handling of glucose is inevitable in aging, I found that some 80-year-old subjects had perfectly normal glucose tolerance and were better than normal in their sensitivity to insulin," he stated.

Rosenthal has theorized that physical fitness is one factor that might explain his observations, that perhaps "staying in good shape" prevents any deterioration of glucose metabolism, or promotes normal handling of glucose.

Rosenthal recently observed a correlation between insulin sensitivity and physical fitness as measured by maximal exercise testing in subjects up to age 50. Now he wants to extend the study to a group of older men.

Athletes currently in training are preferred for the study, which requires spending two nights and two mornings in the clinical research center (CRC) at Stanford. Rosenthal will compare well conditioned elderly athletes—mostly runners and swimmers—with more sedentary men of the same age group.

Participants will undergo, at no cost to themselves, glucose tolerance testing, testing for insulin sensitivity, and basic lab tests. Medical histories will be taken and complete physicals including EKG performed.

As outpatients, volunteers will go through exercise testing on a bicycle ergometer at the Stanford Heart Disease Prevention Program. Also, percentage of body fat will be measured by underwater weighing.

Rosenthal has already tested eight subjects, and expects the study to last until spring. For further information, contact him from 9-5 weekdays at 858-3933.

Editor's note: The Medical Center Memo *is happy to help publicize the need for volunteers in research efforts throughout the Medical Center, when appropriate. Contact Lisa Ames, at 7-6911, or send materials to Medical News Bureau, TC-135.*

Thief with good taste filled his house with art objects stolen from others

continued from page 1

Tuesday. "We have reason to believe he had another gold mine," he said.

On Monday Niemeyer estimated property believed stolen by O'Connor in the past two years could be worth $3 million.

According to Stanford Police Sgt. Nick Bruno, children near the O'Connor home in La Honda reported seeing a cat similar to one reported stolen in Palo Alto. San Mateo County Deputy Michael Preston developed information indicating the cat and O'Connor were at the Burt residence.

San Mateo County Sgt. Dave Bennett coordinated the three raids.

Niemeyer said O'Connor may have been involved in at least 30 Stanford residential burglaries, plus 50 in Los Altos, 30 in Palo Alto, 20 in Menlo Park, and more in Atherton and other parts of San Mateo County. All involved similar methods of operation.

Most occurred during the fall months, often between 5 and 10 p.m. Thursdays and Fridays. The burglar parked his car in the neighborhood, then jogged around to spot likely households. He usually entered through the rear of the house, trying to get in easily but not hesitating to break a window if necessary. He apparently wore gloves.

A real professional

"He's the most prolific and professional house burglar I've ever seen," Niemeyer said. "Apparently, he was working independently," although he may have a few accomplices.

"He appears to be a very intelligent individual," Niemeyer added. He may have been involved in several recent "cat burglaries" on campus, striking late at night while residents were in their homes.

Identified as a suspect in an Oct. 27, 1981, Menlo Park burglary, O'Connor was traced through materials he consigned to an art dealer in Renton, Washington. After noticing a name and address with some valuable dinner plates, the dealer contacted detectives in Los Altos, who confirmed that they had been stolen.

Since the property had crossed state lines, the FBI became involved. Niemeyer was able to match photos they took of a Kashan rug O'Connor also left on consignment with the dealer with pictures taken by its Stanford owner before it was stolen.

The dealer identified O'Connor from a photograph and said O'Connor had left Maureen's name and address as a contact when the goods were sold.

A Volkswagen camper stolen from another Stanford campus home was found and identified by officers at O'Connor's home Thursday. His wife, Maureen, was arrested at the scene after a man believed to be O'Connor fled on foot "like a gazelle," Niemeyer said.

At 10 a.m. Thursday, Niemeyer went to the La Honda residence with Stanford Sgt. Nick Bruno, FBI Agent Mike Keeley of Palo Alto, and Detective Elizabeth Martin of the Palo Alto Police Department. She wanted to discuss some allegedly stolen property which had been left at a pawn shop by Maureen O'Connor.

"When we knocked on the front door, we saw the man move to the rear, then bolt out of the house like a hornet," past Martin, Niemeyer said. When Maureen O'Connor arrived at the scene, she was told to go to her house. The man believed to be Robert was spotted again, "but took off across a field into the forest. . .there was no way I could catch him," Niemeyer said.

Maureen O'Connor would not consent to a search of the house, so Niemeyer and Keeley left Bruno and Martin at the scene, then ran checks on vehicles observed there. One proved to have been stolen from a Stanford resident.

They also had observed a great deal of property under the house and had seen valuable rugs and other items through the windows. With this information, they obtained a search warrant, returned to the house with an 18-foot U-Haul truck and several other officers and spent 12 hours—from 7:15 p.m. Thursday to 7:15 a.m. Friday—filling it with property believed to have been stolen. The truck is "stuffed like Fibber McGee's closet," Niemeyer said.

The 24-karat pigsty

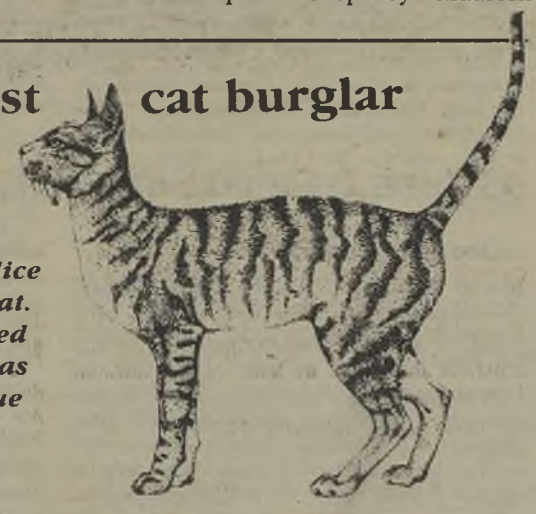
While the house itself was "a pigsty," he added, the couple apparently ate off of 24-karat gold plates and used exquisite silver settings. "He didn't take any junk," Niemeyer said. The house was filled with African, Asian, Middle Eastern and other art objects; expensive photographic equipment; all kinds of sports gear, including tennis rackets, scuba, bows and arrows; firearms; rugs, furs, and jewelry.

O'Connor is believed to have been a jewelry maker, and may have studied Asian and native American art. Neighbors said he may have been a part-time track coach at a Bay Area high school, but could not identify it.

Police found no drugs and very little TV or stereo equipment. "He was a professional in it for the money," Niemeyer said. "He knew this area was affluent. People travel around the world collecting, and he'd collect from them."

A passport belonging to the Kashan rug's owner was found under the bed at the O'Connor residence. "There were lots of boxes and suitcases there with other owner's names," Niemeyer added.

A little more than a year ago, Officer Simpson of the Menlo Park police found a white Saab registered to O'Connor with its rear hatchback open, loaded with jewelry and other property near the scene of an interrupted burglary. O'Connor's wallet was in the car. A man clad in a jogging suit jumped out of nearby bushes and ran away. When police arrested O'Connor as a possible suspect, the visual identification was insufficient.



Later, he avoided a continuous three-week stakeout by police.

Niemeyer praised Los Altos Detective Lee Lera for his cooperation and work in tracing the thefts.

Any of it yours?

Police now face a mammoth task in organizing and identifying the physical evidence. Midpeninsula victims burglarized since early 1981 have been asked to obtain copies of their police reports and then call (415) 497-9639 if they believe their property may have been recovered.

Feline provides solid evidence against cat burglar

Ninety-nine out of 100 police would have ignored the cat. Because these people cared about something as real as an animal, they got a clue that led to the burglar.

Because they cared about the loss of a cat, Midpeninsula police Tuesday, Nov. 9 got what they called a "major clue" in arresting Robert Lee O'Connor, a prime suspect in 130 burglaries with a total loss of $3 million in the past two years.

"It's really incredible," said Peter Carpenter, a former Stanford executive, who owned the Abyssinian cat, called "Two" (because she was second in a litter of three).

"Ninety-nine out of 100 police would have ignored the cat. Because these people cared about something as real as an animal, they got a clue that led to the burglar."

Carpenter said Palo Alto Officer Trudy Eitel, who investigated a burglary at his home in October, 1981, promised to keep track of the cat's loss, after he assured her the pet would never have left home voluntarily.

On Thursday, her colleague, Palo Alto Detective Elizabeth Martin, went to the O'Connor residence in La Honda to question his wife, Maureen, about some alleged stolen property. She remembered to ask neighborhood children about the cat. They said Robert O'Connor had given the cat to a friend in Montara, where O'Connor was arrested in a predawn raid Tuesday. The cat was there.

"Two" has been placed in protective custody at the Palo Alto Pound, for use as evidence.

Stanford Police Chief Marvin Herrington reported late Tuesday that another truckload of alleged stolen property was recovered at Montara. Officers had two additional search warrants in San Mateo County. "The stuff just keeps rolling in," Herrington said.

Carpenter, who now lives in Atherton, is a vice-president for corporate strategy at Alza Corporation. During 1973-76 he was executive director of the Stanford Medical Center and assistant vice-president for medical affairs at the University.

Nuclear power is the answer: Bertram Wolfe

The U.S. government's current moratorium on nuclear power plant construction could cause a severe national energy shortage by 1990, a vice-president from General Electric Co. said Monday, Nov. 8, at Stanford.

Speaking to about 50 engineering students, Bertram Wolfe, vice-president of nuclear and special systems at General Electric Co., said that dependence on oil and coal energy will not solve the nation's long-term energy demand.

"The oil crisis is far from over," said Wolfe, "and coal energy brings with it some serious health and safety problems like 'acid rain' and carbon dioxide poisoning of the environment."

Wolfe blames the present moratorium on three factors:

* a "licensing mess in Washington" which, he claimed, President Reagan is intent on correcting.

* an "unhealthy financial situation" among public utility companies.

* public outcry against the potential safety and health hazards of nuclear power plants.

"What we need today is a meaningful reaffirmation of the 1954 Atomic Energy Act that would make nuclear power the long-term energy goal of the U.S.," said Wolfe.

Since nuclear power plant construction began at Oak Ridge, Tennessee in November 1943, $200 billion has been invested. Today, nuclear power supplies approximately 100 gigawatts (one billion watts) of electricity, or 11.9 percent of the nation's total energy need in 1981, according to statistics from the U.S. Department of Energy in Washington, D.C.

In the past 10 years, however, no nuclear reactors have been commissioned to be built, said Wolfe. "The realities of the decline in nuclear energy might lead us to an erosion of current fission reactor design and capabilities," he added.

Wolfe said that he believes that spending money to redesign existing power plants does not "get to the root of the problem. . . . By fixing various technical aspects in plant design, you still can't reduce the risk to zero. Nuclear power has a perfect safety record anyway."

Three Mile Island could have been cleaned up by now for one-half the cost it lost from being out of operation, said Wolfe, who also said that he believes the issue of nuclear waste is "not a serious technical problem."

Claiming that the lack of government support for licensing approval is the most important hinderance to nuclear energy development, Wolfe also said that there exists a "hostile attitude in Washington" that will, in the long run, endanger the United States' energy situation.

Wolfe predicted that France and Japan will be the most "energy-independent" countries by the early 1990s because of their government's support of nuclear power plant construction.—**Craig La Grow**

Some of the Governor's Corner residences opened this quarter.

Governor's Corner houses named after Stanford people

A number of the new buildings in Governor's Corner have been named, Dean of Student Affairs James W. Lyons has announced.

The buildings were named after people who made significant contributions to their fields of scholarship, were widely known on campus for many years, improved the quality of life for Stanford students, and were dedicated teachers or were in other ways known to and respected by undergraduates.

Those honored at Governor's Corner are as follows:

Ephraim Douglass Adams came to Stanford in 1902 as an associate professor of history. He was a productive scholar in the field of diplomatic history and a recognized authority on the Civil War and British-American relations.

To Adams is credited the idea, the planning, and the early leadership of the Hoover War Library; he was a member of the Library's directing board and its first chairman.

He was an enthusiastic and popular teacher for 28 years, serving from 1908-1922 as executive head of the History Department.

Adams died at his campus home Sept. 1, 1930.

Melville Best Anderson, first head of the English Department, was one of the original band of scholars called to Stanford by Dr. Jordan in October, 1891. In his 25 years of service, 19 of them as department head, he became widely known as a scholar and translator, and as a teacher who inspired in many students an appreciation and love of literature.

Retired from active service in 1916, Anderson died in La Jolla on June 8, 1933.

Orrin Leslie Elliott arrived at Stanford even before the academic opening of the University in 1891. Invited by Dr. Jordan to be the registrar of the new University, he served continuously in that post until retirement in 1925.

Elliott's scholarly background, his contributions to academic organization, and his keen observations of Stanford's early growth found expression in 1937 in his published history, *Stanford University, the First Twenty-Five Years*. Elliott died on Aug. 28, 1940.

James Owen Griffin was called to Stanford in 1891, one of the group invited by Dr. Jordan to form the first faculty of the University. From 1891 until his retirement in 1917, he served Stanford as professor of German and, for much of that time, as head of the German Department.

Griffin died on Feb. 11, 1939.

Oliver Peebles Jenkins studied at Indiana University under David Starr Jordan, professor of natural history and then president of that university. Subsequently invited to Stanford to join the pioneer faculty in 1891, he became the first professor of physiology and served in that capacity until his retirement in 1916.

With another Stanford colleague, Jenkins identified Pacific Grove as the best location for the establishment of the Hopkins Seaside Laboratory (now Hopkins Marine Station) for the study of marine biology.

Jenkins died in 1935.

Charles David Marx was one of a group of early Cornell students whom Jordan brought to Stanford in 1891 as members of the first faculty. Marx's initial task was to head the Department of Civil Engineering; from 1917 until his retirement in 1923, he also served as vice-president of the University under President Ray Lyman Wilbur.

Upon Marx's death in 1939, former President Herbert Hoover said: "His services to education and to the American people represent the finest citizenship of our country."

Augustus Taber Murray—classicist, Quaker, athlete, and descendant of New England whalers—came to Stanford in 1892. He remained in active service at the University for 40 years, retiring in 1932.

On the duty of a scholar: "It is his privilege not merely to teach, but to exert upon the lives of the young men and women an influence which may be past measuring." Murray's life and work are impressive testimonials of his own adherence to this intellectual creed. He died Mar. 8, 1940.

David Morris Potter, Stanford historian, author, teacher, and nationally-known expert on the Southern secession, came to Stanford from Yale University in 1961. Potter was immensely popular as an undergraduate teacher; students crowded his celebrated courses in constitutional history, the South, the Civil War, and the American character; in 1968, he received the Dinkelspiel award for excellence in teaching.

At the time of his death, Potter held the distinction of serving as president of both the American Historical Association and the Organization of American Historians. Four of his books have been published posthumously, including *The Impending Crisis*, which was awarded the Pulitzer Prize in history in 1976. Stanford historian Don Fehrenbacher was personally requested by Potter to complete the several works in progress at the time of his death; Fehrenbacher and another noted Stanford historian, Prof. Carl Degler, collaborated on these tasks for several years.

Potter, who held the endowed Coe professorship of history at Stanford, died Feb. 18, 1971.

Edgar Eugene Robinson came to Stanford from Carleton College in 1911 to accept an assistant professorship in the History Department. He subsequently served as executive head of the department for 23 years, received one of the first endowed professorships at Stanford, and was the honored person of Stanford's third endowed professorship—the Edgar E. Robinson Professorship in United States History.

He chaired the Committee on the Independent Study Plan from 1928 to 1944, overseeing an innovative plan of individually tailored programs of study, the precursor of departmental honors programs.

A mainstay of the University for over 40 years, Robinson died at his Palo Alto home Sept. 7, 1977.

Leonard Isaac Schiff, professor of physics, served Stanford in many capacities during his 24 years at the University.

Executive head of the Department of Physics from 1948 to 1966, Schiff is credited with building and sustaining a nationally distinguished department. In 1968, his faculty colleagues elected him first chairman of the Faculty Senate, a position he held concurrently with chairing the Advisory Board, an elected group of faculty concerned with major academic appointment. From 1966 to 1968, Schiff was a member of the Steering Committee of the Study of Education at Stanford, an ambitious self-study that resulted in many improvements in education programs and student services.

His contributions to teaching and to undergraduate education were recognized in 1966 by the Dinkelspiel award, Stanford's highest faculty honor. In addition to more than 140 research papers in theoretical physics, Schiff was internationally known for his textbook *Quantum Mechanics*, first published in 1949.

Known throughout the University for his integrity, selfless devotion, strength and gentleness, Schiff died unexpectedly on Jan. 19, 1971.

Payson Jackson Treat received Stanford's first Ph.D. in history in 1910, five years after his appointment as an instructor in the History Department. Traveling in 1906 to East Asia, India, and Australia launched his career as a pioneer American scholar in Far Eastern history. His subsequent travels, research, writing, and teaching in the field of East Asian history were complemented by his active involvement in the Institute of Pacific Relations after World War I and his untiring efforts to promote better Japanese-American relations prior to World War II. In 1935, the Emperor of Japan decorated Treat with the third class Order of the Sacred Treasure.

When Treat retired from Stanford in 1945, he had served for seven years as executive head of the History Department and had, by his estimation, taught more than 7,000 Stanford students.

Payson Jackson and Jessie McGilvray Treat, Stanford class of 1906, made their campus home for many years on Dolores Street, where Treat died June 15, 1972.

Mary Yost came to Stanford at the invitation of Ray Lyman Wilbur in 1921 as dean of women and associate professor of English. After 25 years of distinguished service, she retired in 1946.

Nationally known for her concerns about the education needs of women students, her work at Stanford coincided with the University's second 25 years of life—a period of transition from a small and intimate college to the larger and more crowded institution of today. Miss Yost's example of faith in young people and in student self-government, combined with adherence to high standards of conduct and academic performance, helped countless students—and the University—through difficult times of growth and change.

Mary Yost died Mar. 4, 1954.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

HOLIDAY COMING!

Due to the upcoming Thanksgiving holiday, all requisitions for newly opened positions must be in the Personnel Office, Old Pavilion, by 9 a.m. Tuesday, Nov. 23, in order for the positions to be listed in *Campus Report* the following week (Dec. 1).

Exempt

44521-AW (JCC:4076) PROGR/ANALYST GEN II Posses programming & sys analysis skills to independently analyze one or more Univ functions, & design interfaces w/ other sys & programs; must have the ability to understand user procedures, program requirements & documentation need functions as jr. member of a team & assts higher level programmers; QUALIFICATIONS: exp in SPIRES programming; ability to define & conceptualize complex logical problems; familiarity w/ modern offc informa sys, batch sys approaches, sys environments & capabilities & structured analysis techniques.; C06; $1854-2312. 1

36545-FM (JCC:2128) ACCOUNTANT II Respon for endowment income allocation, under direction of Supr of Endowment Acctg; analytical posting & maintaining manual ledger that controls endowment funds & their investment pools & determine cash flow available for investment for each of the pools; posting an analysis ledger to determine income & expenses of the specifically invested funds; maintaining share worksheets & computerized shares file; supporting develop't of new sys in endowment area; asst in yr-end closing; prep financial statements, etc; QUALIFICATIONS: BA/BS in acctg or equiv exp, plus 3 yrs of professional acctg exp; requires broad genl knowl of acctg; exp In fund actg and/or acctg for securities & security income helpful; knowl of WYLBUR/SPIRES/VISICALC helpful; effective oral & written commu skills.; C06; $1854-2312.

31428-VW (JCC:2262) FIN/MGMT ANALYST II The analyst respon for maintaining data bases of patient demographic informa; prep analyses of availability & demand for physician serv in the region; as a corollary, the analyst will be respon for preparing gross revenue, net revenue & cash collections budgets exceeding $50 million & spanning 75 operating cost ctrs; require statistical tech as well as financial analysis & extensive interaction w/ physicians, dept business mgrs, & FPP sr. mgmt; QUALIFICATIONS: bachelor's degree in business or economics w/ several yrs of exp in finance or marketing; excel verbal & written commu skills; knowl of statistical analysis; knowl of data processing concepts preferably w/ some programming familiarity; flexibility open to change & willing to learn new skills.; C07; $2113-2724.

31348-LL (JCC:5588) LIFE SCI RES ASST I Fixed term 11/15/82-5/14/83; 50% or 100%; prep of renal membranes by centrifugation; performing transport studies in membrane vesicles; performing column chromatography & gel electrophoresis; handling radioactive isotopes incl 3H, 14C & 125I; the sacrificing of animals will be regularly required; developm't of experimental protocols & writing tech papers; ability to make theoretical & practical judgments in order to change experiments w/out immediate consultation w/ principal investigator; QUALIFICATIONS: bachelor's degree in biology or chemistry or equiv exp; some knowl of protein chemistry, centrifugation, separating columns, gel electrophoresis & immunological tech helpful.; C05; $835-1043.

23592-AW (JCC:7534) FACIL ENGINEER/COORD II Responsible to Dir, Computer Sci Computer Facilities; effect smooth operation of computer sys by working w/ programmers, sys mgrs, & users to meet user requirements; handle inquiries/requests; supv & implement operational details of facilities; develop & propose operating & admin policies & procedures; schedule telecomm & datacomm serv required fr Stanfords; perform or supv installation of dataomm, telecomm, sys interconnections, networks, terminal devices; QUALIFICATIONS: prior exp in computer sys operations is mandatory; 1 exp/knowl in several of the following is highly desirable: Hardware: DEC-10, DEC-20; PDP-11; VAX 11/780; VAX 11/750; M68000; Networks/DataComm/Protocol s: Arpanet; Ethernet (3MHz & 10 MHz); dial & lease telecomm; Pup, NCP, TCP/IP, RS232; Software: TOPS-10, TOPS-20; Unix;C; SAIL; Pascal; Macro-20; good commu & writing skills; knowl of & ability to apply sound supvry practices.; C07; $2113-2724.

32503-AW (JCC:8880) MISC PROFESSIONAL Software Licensing Assoc respon for admin of Software Distribution Ctr; corresp & telephone interaction w/ potential customers; creating license agreements; performing market res; processing royalty checks authorizing tape shipments; preparing royalty-sharing agreements for faculty; preparing & filing trademark applications; also respon for seeking out & negotiating commercial license agreements w/ private software companies who wish to develop & market a commercial version of the particular software; QUALIFICATIONS: BS in computer sci or engrg; MBA or marketing exp; negotiating exp; exp in Stanford or other univ admin; excel interpersonal & commu skills.; C07; $2113-2724.

26774-JB (JCC:7650) CUSTODIAN WKG SUPVR 7:30-4pm; supv cleaning, training & other duties of the custodians assigned to you; create & maintain clean, safe, 'home-like' atmosphere for residents; check daily arrival & departure time of each custodian; submit a monthly bldg maintenance & housekeeping report; order supplies; maintain inventory control over mat'ls & keys; attend approp classes; work & commu effectively w/ students, Residential Edu, Resident Fellows & co-workers; when short of custodial help peform needed work; QUALIFICATIONS: be flexible performing job; can accept organizaitonal changes fr outside depts; have good supvry skills; demonstrated admin skills; report writing, attendance records & memos; ability to acquire exp & knowl regarding employee relations & USW contract; 3 yrs housekeeping supvry exp; excel commu skills a must.; S09; $1632.

29757-JB (JCC:7650) CUSTODIAN WKG SUPVR 8-5pm; supv cleaning, training & other duties of the custodians assigned to you; create & maintain clean, safe, 'home-like' atmosphere for residents; check daily arrival & departure time of each custodian; submit a monthly bldg maintenance & housekeeping report; order supplies; maintain inventory control over mat'ls & keys; attend approp classes; work & commu effectively w/ students, Residential Edu, Resident Fellows & co-workers; when short of 1 custodial help peform needed work; QUALIFICATIONS: be flexible performing job; can accept organizaitonal changes fr outside depts; have good supvry skills; demonstrated admin skills; report writing, attendance records & memos; ability to acquire exp & knowl regarding employee relations & USW contract; 3 yrs housekeeping supvry exp; excel commu skills a must.; S09; $1632.

Bargaining Unit

17838-LL (JCC:5638) LIFE SCI TECH I TMS Unit; generation & maintenance of murine T cell clones reactive w/ soluble antigens & analysis of these cells using T cell proliferation assays; production & maintenance of hybridomas; extensive mouse work involving antibody production, immunizations, collection of serum & minor surgery; generates antisera & monoclonal antibodies reactive w/ T cell surface antigens & soluble products of T cell clones; analysis of cell surface antigens of T cell clones by fluorescence activated cell sorting using reagents prepared in lab as well as commercially available; QUALIFICATIONS: training or exp in above techniques; prior lab exp using biochemical or molecular biology tech is important; exp w/ cell culture tech helpful.; A18; $7.5.

42877-LL (JCC:5644) LIFE SCI TECH II TMS Unit; identify, clone, map & seq the related genes of VSG 117 gene family of Trypanosoma brucei to determine the region of Gene critical for transposition; involves growth of T. brucei in rodents, purification of T. brucei fr rodent blood, prep of DNA fr T. Brucei, restriction mapping by Southern blotting of '117' cousins, cloning of genomic DNA fragments in bacteriophage, cosmlds & plasmids, nick translation using 32p of probes, etc; QUALIFICATIONS: molecular biologist w/ exp of all DNA sequencing & gene 1 cloning tech plus some exp of chromatography, analytical biochemistry, cell culturing, animal handling & microbiological techniques.; A24; $8.65.

12683-PB (JCC:7300) FOOD SERVICE WORKER I Thur thru Mon; relieve kitchen & dining room porters & pot washer; sweep & mop floors; clean walls, wash windows in assigned areas; remove, empty & wash garbage cans; remove cans & boxes fr working areas; wash & put away pots & pans & equip't; bus trays & asst in dishroom during student lunch hr; QUALIFICATIONS: must meet health & safety requirements for food serv workers; good physical condition; ability to stand for prolonged periods & to lift, move, & manipulate moderately heavy objs; able to follow instructions & to work w/ others.; A08; $5.95.

22826-PB (JCC:7308) FOOD SERVICE WORKER II TMS Unit; 50%; prep requested sack meals; clean & store all fresh vegetables; make salad dressing as needed; asst pantry worker prepare fruit salads; help cook when nec for lunch production; work extra hrs upon request fr supvr; help keep all areas clean; QUALIFICATIONS: must meet health & safety requirements for food serv workers; ability to stand for prolonged periods; must be able to follow instructions & to work w/ others.; A10; $6.23.

Nonexempt

32115-PM (JCC:2596) SECY II-SPEC Prov sec'l support to 3 diagnostic Radiology faculty, & coord Div Clerkship; respon for phones & typing of corresp, manuscripts, grants; scheduling appts; travel arrangements, prep expense reports & other Univ forms; maintain faculty files as required, etc; QUALIFICATIONS: typ 65; 2-3 yrs sec'l exp; use of dictaphone & accurate typing; medical terminology desireable; ability to interact w/ med students & med staff; contact: Sally Healey, S078 Med Ctr, 497-7863.; B12; $1310-1373.

LAB HELPER 2 half-days/wk approx; prep, dispensing & sterilization of culture media; minor lab housekeeping duties--prep of dirty glassware; routine inoculation of culture tubes in a lab devoted to the biology & genetics of Microorganisms; QUALIFICATIONS: requires good mech aptitude; ability ti be concise & accurate in weighing & measuring; familiarity w/ metric system; extensive lab exp or degree not required; prefer mature person located permanently in the area, & who does not have expectations for expansion into a full-time job; submit resume to Dr. David Perkins, Stanford Univ, Dept. of Biological Sciences; $6.39/hr.

30412-BP (JCC:2454) OFFICE ASST II 50%; hrs can be arranged; genl filing; misc typing; posting on student records; genl offc support; may not smoke in offc; QUALIFICATIONS: typ 55; accuracy; attento detail; ability to work speedily & flexibly; send appl/resume to Mary L. Scott, Bldg 590, Room 209.; B09; $565-595.

32999-BP (JCC:2454/2462) Offc Asst II/III Answer phones (about 12 lines); handle reception, & files at Order Entry Desk; take clear messages; answer routine questions fr customers; operate cash register; will train to process routine job orders & hand out completed jobs to customers; in addition to the above OAIII discuss jobs w/ customers & determine the best methods to achieve desired results; discuss prep of copy & finishing possibilities w/ customers; QUALIFICATIONS: genuine interest in printing & graphic work; good interpersonal skills; well organized; able to handle several tasks at once; good atten to detail & accuracy; some math ability required; light typing; for OAIII: knowl of printing, binding & photo tech; send appl/resume to Darla Wilson, 560 Panama Street.; B09/B11; $1130-1189/1246-1310.

29431-PM (JCC:2454) OFFICE ASST II 50%, Fixed term 11/22/82-5/23/83; 8-12 noon; prov genl clerical assistance to Asst Dir for Admin of Doctoral Program; frequent contact w/ students & faculty; evaluate & combine mat'ls & documents for admissions files such as GMAT/GRE 1 scores, recommendations, financial aid requests, & transcripts; work w/ confidential mat'ls, receive visitors; screen phone calls; typing & filing; QUALIFICATIONS: typ 45-50 accurately; legible handwriting; prof'l telephone man-

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

Library Associates to hear Halsband

Associates of the Stanford University Libraries will be provided with an intimate look into the life of an early feminist when they meet on Sunday, Nov. 21.

Robert Halsband, a current Guggenheim fellow and professor emeritus at the University of Illinois, will discuss "Lady Mary Rides Again: The Significance of Lady Mary Wortley Montagu Then and Now," at 3 p.m. in Annenberg Auditorium.

Halsband, who is also a reader at the Henry E. Huntington Library in San Marino, notes that Lady Mary was significant in 18th century England for her advocacy of women exercising their personal liberty, participating in politics and public affairs and asserting their ambitions professionally.

Halsband, who had edited several volumes of Lady Mary's letters, remarks on her reputation as one of the great English letter writers. He is author of *Lord Hervey: Eighteenth Century Courtier* and *The Rape of the Lock and its Illustrations 1714-1896*.

A reception will follow the program in the Louis R. Lurie Rotunda of the Cecil H. Green Library. The public is invited. There is no charge.

Sir Michael Palliser to lecture on detente

Sir Michael Palliser, recently retired as Permanent Undersecretary of the British Foreign Office, will talk about "The Future of Detente in British Perspective" at a public lecture at 4:15 p.m. Thursday, November 18, in Room 205, History Corner.

Sir Michael, who has been the top civil servant of the Foreign Office for a number of years, most recently headed the British cabinet's task force dealing with the Falkland conflict. His lecture is sponsored by the Western European Studies Committee and is open to the public.

Book Month observed

In honor of Jewish Book Month, the first in a series of monthly Jewish Book Club meetings will be held from 10 a.m. to noon on Sunday, Nov. 21, 1982, in the Stanford Hillel Library (basement, Old Union Clubhouse).

Rabbi Ari Cartun will dedicate the new library facilities.

The meeting, open to the public, is sponsored by the Stanford Hillel Committee and the Palo Alto B'nai B'rith Men's Lodge.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, Nov. 16, in Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Gregory Wait (above) will conduct the Stanford Chorale in music of Britten, Purcell, and Vaughn-Williams at 8 p.m. Tuesday, Nov. 16, in Memorial Church.

Alan Gampel (left) is soloist in the Rachmanioff Piano Concerto No. 2 when Andor Toth conducts the Stanford Symphony at 8 p.m. Saturday, Nov. 13, in Dinkelspiel Auditorium. Also on the program: Haydn and Stravinsky.

Modern Japanese architecture topic of Watanabe talk

"Transformation of the Western Model?: A Perspective on Modern Japanese Architecture" will be the subject of a slide talk by Hiroshi Watanabe at 7:30 p.m. Tuesday, Nov. 16, in Room 2 of History Corner at Stanford.

His free public talk is cosponsored by the Center for East Asian Studies at Stanford and the Japan Society of Northern California.

Watanabe has worked in Tokyo as an architect and architectural critic since 1971. After studying at Princeton and the University of Tokyo and receiving a master of architecture degree from Yale, Watanabe began his career with the firm of Maki and Associates.

He subsequently served as visiting lecturer at Columbia and Kanto Gakuin University, and as Japan correspondent for *Architecture Plus* and *Progressive Architecture*. His talk will focus on Western influences in Japanese architecture.

For further information, please call the Center for East Asian Studies at Stanford University at 497-3362.

Margaret Fabrizio

Fabrizio presents Italy, Bach, and her own music

"Italy and Bach—Past and Present" is the theme of harpsichordist Margaret Fabrizio's recital at 8 p.m. Friday, Nov. 19, in Annenberg Auditorium at Stanford.

Presented by the Music Department, her concert will be in two sections. The first half will feature Italian music from 1637 to 1970, opening with a recently discovered *Sonata per Cembalo* by Azzolino Bernardino della Ciaja, composed in 1738.

Representing contemporary Italy will be *Domino* by Marcello Panni—composer-in-residence at Mills College and a native of Rome. In this piece Panni leaves much room for improvisation by the performer.

Rounding out the Italian portion of the program will be *Toccata Seconda* by Frescobaldi and four sonatas by Scarlatti.

The second half of Fabrizio's program will include preludes and fugues from Bach's *Well-Tempered Clavier*, which Fabrizio recently performed in its entirety at San Francisco's Palace of the Legion of Honor.

Concluding the concert will be Fabrizio's own composition: *Hands Across the Sea*, which is based on the chord progression and figuration of Bach's first prelude in C Major from the *Well-Tempered Clavier*.

Written this year, it is scored for two tracks of pre-recorded tape, one in meantone tuning and the other in well-tempered tuning; amplified harpsichord in both tunings; and Innermedia projection by Fabrizio—images from three slide projectors superimposed upon each other, giving the effect of a movie.

Tickets are $4 general, $2 for students and senior citizens, available from Tresidder Ticket Office (497-4317) and the door.

Shanghai Conservatory students to perform on Chinese instruments

Five young artists from the Shanghai Conservatory of Music will perform traditional Chinese music at Stanford University at 8 p.m., Friday, Nov. 19, in Room 281 on the second floor of Tresidder Union.

The young women, ranging from age 17 to 22, are touring the U.S. from the People's Republic of China for the first time.

Their performance will include solos and ensembles of Chinese stringed instruments; the guzheng, pipa, erhu, yangqin, and liuqin.

The Shanghai Conservatory of Music, established in 1927, is China's oldest music institute. It trains the best of China's young musicians in both Chinese and Western instruments and was featured in the recent film, "From Mao to Mozart," with Isaac Stern. The conservatory's 400 students include boarders in elementary and high school as well as professional school students.

The musicians to perform at Stanford are Qiu Li-rong, 19, freshman in the Folk Music Department majoring in pipa; Wu Qiang, 17, a middle school junior majoring in liuqin; Yuan Li, 20, a senior in the Folk Music Department majoring in yangqin; Fan Yan-yan, 19, a junior in the Folk Music Department majoring in erhu; and Yao An, 22, a junior in the Folk Music Institute majoring in guzheng.

Their program emphasizes traditional folk tunes, such as the pipa solo, "Spring Snow," the yangqin solo, "Call to War," and the quintet, "Parting at Yangguan."

The November 19 concert, sponsored by the Center for East Asian Studies, is open to the public, free of charge.

Tresidder offers chance to think up art programs

In celebration of its twentieth anniversary, Tresidder Union is offering Stanford community members an opportunity to present art programs in sponsorship with the Union.

The arts have been a major focus of Tresidder programs over the years. In recognition, the union offers financial, technical and promotional support for art programs organized by groups or individuals especially worthy.

Proposals will be judged on suitability to the anniversary theme, uniqueness, creativity, diversity and the ability to complement other planned programs.

They should also support the Tresidder goal of "enhancing the living, learning, and working environment of Stanford by providing a social center for informal interaction as well as programming, and experiences of cultural, recreational, and educational nature."

Interested applicants may pick up forms at the Tresidder information desk. The deadline is Dec. 1; announcements will be made by mid-December. For further questions, call Twentieth Anniversary Coordinator Nanci Howe at 497-4311.

Ng-Quinn to perform in solo recital

David Ng-Quinn, pianist and D.M.A. candidate, will perform at 8 p.m. Saturday, Nov. 20, in Tresidder Lounge at Stanford.

Presented by the Music Department, Ng-Quinn's program will include a Bach toccata, a Beethoven sonata, two Romanian dances by Bartok, three preludes by Debussy, and *Variations on a Theme by Paganini* by Brahms.

Last year Ng-Quinn performed the Brahms *Piano Concerto No. 2* with the Stanford Symphony Orchestra to impressive reviews. "He carried the whole. . .with the aplomb of a veteran seasoned by years of touring," said the *Stanford Daily*. "The final chords sent the audience into cheers of recognition, of thanks, and of praise for this young pianist who shared this wonderful performance with them."

A native of Hong Kong, Ng-Quinn received his B.A. from Cornell and his M.M. from the University of Wisconsin-Madison. At Stanford he studies with Adolph Baller,

Gibbs to speak on jazz to Staffers

Prof. James Gibbs, anthropology, will present an informal lecture-demonstration on the African roots of jazz to the Stanford Staffers at their regular monthly meeting at noon Wednesday, Nov. 10, in the Anthropolgy Museum, Building 110.

Gibbs will use audio tapes to trace African musical forms to the forms of the Caribbean, Brazil, and the Afro-American music which gave birth to jazz.

The meeting is open to the Stanford community.

Thorne to speak on black holes, etc.

The fourth annual Bunyan lecture on cosmology will be presented by Prof. Kip Thorne at 8 p.m. Tuesday, Nov. 16, in Room 100 of Physics Lecture Hall at Stanford.

His topic will be "Black holes, White Holes, Wormholes, and Tunnels through Hyperspace."

Thorne is the William R. Kenan Jr. professor of theoretical physics at the California Institute of Technology and a member of the National Academy of Science. His research has had a profound impact on many areas of theoretical astrophysics and gravitation, including relativistic stars, gravitational radiation, and black holes. He is one of the authors of the now classic tome, *Gravitation*.

The Bunyan lecture will be at a level appropriate to a general audience.

Thorne will present a more technical lecture at the Applied Physics and Physics Colloquium at 4:15 p.m. Wednesday, Nov. 17, in Room 101, Physics Lecture Hall. His topic will be "Paradigm Changes in Black Hole Physics."

The Guarneri's here again—concerts Sunday, Wednesday

The world masters of chamber music, the Guarneri String Quartet will be presented by the Lively Arts at Stanford at 2:30 p.m. Sunday, Nov. 14 and at 8 p.m. Wednesday, Nov. 17. Both concerts are in Dinkelspiel Auditorium.

The program for the Sunday concert will include: Haydn's "Quartet in G minor, Op. 74, No. 3"; ("The Rider"); Brahms' "Quartet in B-flat Major, Op. 67, No. 3; and Debussy's "Quartet in G minor, Op. 10."

The Wednesday evening concert will include: Mozart's "Quartet in D Major, K. 499"; Barber's "Quartet, Op. 11"; and Dvorak's "Quartet in A flat Major, Op. 105."

The Guarneri String quartet is considered to be among the preeminent string quartets in the world today. Arnold Steinhardt and John Dalley, violins; Michael Tree, viola; and David Soyer, cello, are the original members of the Guarneri which was founded in 1964 at Vermont's Marlboro Music Festival.

The Quartet tours to cities and colleges throughout the United States and Canada, and to Europe, New Zealand, Australia, Japan, as well as to major international music festivals. They have been featured on television and radio specials, documentaries and educational presentations both in the United States and abroad. They are also the subject of a book by Helen Ruttencutter entitled *Quartet*.

Last season Mayor Koch presented them with the New York City Seal of Recognition, an honor awarded for the first time.

Three of the four players are presently faculty members of the Curtis Institute of Music in Philadelphia and all members of the Quartet have been appointed as Professors of Music for the 1982-83 academic year at the University of Maryland.

The Guarneri's recordings, several of which have won international awards, are exclusively on RCA Red Seal. Among their recordings are collaborations with such artists as Arthur Rubinstein, Pinchas Zukerman, and Boris Kroyt and Mischa Schneider of the Budapest Quartet.

For ticket information call Tresidder Ticket Office, (415) 497-4317, BASS and other Bay Area agencies.

Falcon to speak at I-Center Tuesday

Prof. Walter Falcon, director of Stanford's Food Research Institute, will speak at the next Tuesday Luncheon-Lecture sponsored by the International Center beginning at noon, November 16, at the I-Center.

Falcon, who came to Stanford in 1972 as director for the Food Research Institute, will speak on the issue of "World Hunger" and its ramifications for world peace.

Previously, Falcon served as a member of the President's Commission on World Hunger from 1978 to 1980. He currently sits on the board of trustees for CIMMYT (International Maize and Wheat Research Center in Mexico) and the Agricultural Development Council.

Falcon has written numerous articles on the role of the United States in solving world problems. He also coauthored two forthcoming books, *Casavah in Java* and *Food Policy Analysis*.

Falcon's lecture is part of the I-Center's continuing luncheon series. This quarter lecture topics deal with the origins of problems which plague international relations. Tickets for lunch cost $2.50, but brown baggers are invited at no charge. For more information, phone the I-Center at 497-1831.

Quantum gravity topic of lectures

Prof. John Archibald Wheeler of the University of Texas-Austin will present three lectures on the ramifications of quantum gravity. They are as follows:

4:15 p.m. Monday, Nov. 15: "This Incredible Quantum Business" in the SLAC auditorium;

1 p.m. Wednesday, Nov. 17: "Beyond the End of Time" in the SLAC auditorium;

4:15 p.m. Monday, Nov. 22: "The Boundary of a Boundary as the Foundation of Physical Law" in Room 101, Physics Lecture Hall.

The lectures are open to all interested people.

Rebecca Northern speaks on orchids

Rebecca T. Northen, will give an illustrated lecture on orchids and their Illustrators at 3 p.m. Sunday, Nov. 14, in Annenberg Auditorium at Stanford.

A reception will follow in the Lurie Rotunda of Green Library, marking the opening of an exhibit of books from the collections of William K. Glikbarg and the Stanford University Libraries entitled, *The Orchid Observed: Five Centuries of Botanical Illustration*.

An exhibit catalogue and poster will be available for purchase. The exhibit will continue through January 11.

Films scheduled on Rome, Stockholm

The International Center will present another Cities of the World segment of its Other Cultures film series at 7:30 p.m. Thursday, Nov. 18 at the Center.

The first film, "Anthony Burgess' Rome" explores the dual nature of Rome, where Catholicism and Roman paganism blend to create a unique harmony. International literary figure Anthony Burgess introduces the viewer to Rome and its many famous pieces of art.

Swedish actress-writer-director Mai Zetterling narrates the second film. "Mai Zetterling's Stockholm" explores the capital of one of the most affluent countries in the world and features conversations with such personalities as Queen Christiana and August Strindberg.

The Other Cultures film series is a weekly program, sponsored by the I-Center, designed to inform as well as to entertain. Admission is free, however a 75 cent donation is requested at the door. For further information, phone 497-1831.

What terrible fortune does Buttercup see in the palm of Captain Corcoran? She foretells a great change in his life, and Buttercup herself holds the secret that will bring happiness to the lovers on the H.M.S. Pinafore.

Savoyard's new staging of *Pinafore* starts Friday for six performances

The Stanford Savoyards will present Gilbert and Sullivan's *H.M.S. Pinafore or the Lass that Loved a Sailor* Friday through Sunday, Nov. 12-14 and 19-21, in Dinkelspiel Auditorium. All performances are at 8 p.m. except the 2 p.m. matinee on Sunday, Nov. 13.

Pinafore, probably the best known and most loved of all the G&S operettas, is set in England on the deck of the Pinafore. It concerns the love affair of Josephine, daughter of Captain Corcoran, and Ralph, a common sailor aboard the ship. Their happiness appears doomed, however, due to the difference in their social class and the fact that Josephine has been promised to Sir Joseph Porter, K.C.B., the patronizing and stuffy First Lord of the Admiralty.

Ralph and Josephine plot an elopement but their plans are revealed to the Captain by the evil Dick Deadeye. Ralph is soon in irons and everyone despairs. It is up to Little Buttercup (who loves the Captain, by the way) to save the day. She does so by revealing a secret she has kept for many years.

Their differences swept away, Ralph and Josephine are reunited and the operetta ends happily in true G&S fashion.

Stage director for *Pinafore* is Tony Orazem, who has directed two other Savoyard shows and productions of the Menlo Players. Music director is David Friburg; assistant director and chorus master is Chris Dant; and choreographer is Pat Terman.

Tickets at $5 general admission or $3 for students are available at Tresidder Ticket Office or at the door.

Harvard professor speaks on racism

Harvard Prof. Martin L. Kilson will speak on "The Crisis of the Black Intellectuals: Dilemmas of Racism and Racist Society" at 4 p.m. Tuesday, Nov. 16, in the History Corner, Room 307 at Stanford.

Kilson is one of the most distinguished Americans writing on Afro-America and Africa. He is known for his provocative style, and his willingness to tackle difficult, controversial issues.

He has written extensively on African politics and on Afro-American politics, black intellectuals, black education in America, and notions of ethnicity among America's minority groups.

Each year, the Afro-American studies program at Stanford organizes its efforts around a particular theme. Last year, it was black popular culture. This year, the program will sponsor films, speakers, and panels about Afro-Americans who advanced ideas about the nature of Afro-American and American society—political thinkers, artists, writers, intellectuals.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Nov. 10, to cover the week of Mon., Nov. 22, through Sun., Nov. 28.

LATE ANNOUNCEMENTS

Wed., Nov. 10. Art Dept. Lecture Series: "Artist-Lithographer Bolton Brown" by Clinton Adams, director of the Tamarind Institute at the Univ. of New Mexico. (Bolton Brown was head of the Stanford Art Dept. in the 1890s) 8:15 p.m. Annenberg Aud. Public cordially invited.

Sun., Nov. 14. Stanford Libraries Associates Lecture: "Orchids and Their Illustrators" by author Rebecca T. Northen. 3 p.m. Annenberg Aud. Public cordially invited.

MONDAY, NOVEMBER 15

Biological Sciences Dept. Seminar: "Genomic Reorganization During Macronuclear Development in Coliates" with Dr. Elizabeth Blackburn, UC-Berkeley. 4 p.m. Room T175, Herrin Labs. Open to the public.

Energy Policy Seminar: "Business Planning in an Uncertain Oil Market" with Thomas Neville, vice president, corporate development, Natomas Company. 4:15 p.m. Skilling Aud.

Numerical Analysis Seminar: "Tracking a Few Exterior Eigenvalues of a Growing Tridiagonal Matrix" with Beresford Parlett, UC-Berkeley. 4:15 p.m. Math 380C.

Stanford Film Society: "Yojimbo." 7 p.m. Kresge Aud. $1.50.

Speakers Bureau/Committee for Justice in the Middle East: Hisham Milhem, Lebanese journalist, will speak about the invasion of Lebanon. 7:30 p.m. CERAS, Room 112. Public cordially invited.

TUESDAY, NOVEMBER 16

Stanford Museum Art Tours: "Provenance of Art: Part II." A lunch tour beginning at 12:15 p.m. Stanford Museum. Open to all. (Tour repeated tomorrow, same details.)

Fluid Mechanics Seminar: "An Exact Theory of Gravity Waves in Two Dimensions and its Implications for Ship Waves" with Dr. Marshall Tulin, UC-Santa Barbara. 4:15 p.m. Skilling Aud.

Communications Design Seminar: "An Advanced Digital Telephone Switch" with Amr Badawi, S.U. 4:15 p.m. McCullough Bldg., Room 128.

CEAS Slide-Talk: "Transformation of the Western Model?: A Perspective on Modern Japanese Architecture" by Hiroshi Watanabe, architectural critic. 7:30 p.m. History Corner, Room 2 (lower level). Public invited.

1982 Bunyon Lecture in Physics: "Black Holes, White Holes, Wormholes and Tunnels Through Space" by Prof. Kip Thorne, Caltech. 8 p.m. Physics Lecture Hall, Room 100. Public cordially invited.

Music Dept. Concert: Stanford Chorale, Gregory Wait, conductor. Britten—Cantata Misericordium; Purcell—Funeral Sentences; Vaughan Williams—In Windsor Forest. 8 p.m. Memorial Church. $4/$2.

WEDNESDAY, NOVEMBER 17

Ecumenical Ministries Wednesday Lunch Discussion: "The Reality of Local" by Nevida Butler. Noon. Casa Zapata (Stern Hall) dining room. Bring bag lunch or arrange to eat at Zapata.

Electrical Engineering/Center for Materials Research Solid State Seminar: "Defects in Amorphous Silicon" with Prof. Dr. Josef Stuke, Univ. of Marburg, West Germany. 3:15 p.m. Peterson 550A.

Physics Colloquium: "Paradigm Changes in Black Hole Physics" with Prof. Kip Thorne, Caltech. 4:15 p.m. Physics Lecture Hall, Room 101.

Electronics in Medicine Seminar: "Medical Ultrasound Imaging: An Overview and Prospects for the Future" with Dr. James Havlice, Diasonics, Inc. 4:15 p.m. McCullough 134.

EE380 Computer Systems Laboratory Seminar: "Network Architecture for Personal Computers" with Skip Stritter, Nestar Inc. 4:15 p.m. Terman Aud.

Stanford Hillel Service: Celebrating Kiddish L'vanah (the Sanctification of the New Moon) and Rosh Chodesh Kislev (the new month of Kislev), the service followed by a panel discussion on "The Changing Role of Jewish Women." 7:30 p.m. Call Hillel, 497-1602, for location.

Speakers Bureau Event: NASA representatives and Columbia Space Shuttle's Dick Truly will speak on their experiences with the shuttle and NASA's long term program to inhabit space. 8 p.m. Kresge Aud. Public invited.

The Lively Arts at Stanford: The Guarneri String Quartet. Mozart: Quartet in D Major, K. 499; Barber: Quartet, Op. 11; Dvorak: Quartet in A-flat Major, Op. 105. 8 p.m. Dinkelspiel Aud. $11.50, $10.50; students $3 off these prices.

Casa Italiana Lecture: "American Literature in Italy: A Retrospective" by Prof. Sergio Perosa, chairman, English Dept., Univ. of Venice. 5 p.m. Casa Italiana, 562 Mayfield Avenue.

Art Dept. Lecture Series: "In This Mirror: A New Form of 'Momento Mori' in 15th Century Netherlandish Art" by Prof. James Marrow, UC-Berkeley. 8:15 p.m. Annenberg Aud.

Lively Arts at Stanford Open Rehearsal: By the Guarneri String Quartet. 4:30-6 p.m. Dinkelspiel Aud. Free and open to the public.

THURSDAY, NOVEMBER 18

Stanford Geothermal Program Seminar: "Heat Extraction Modeling" with Stephen T. Lam, S.U. 1:15-2:30 p.m. Room B67, Mitchell Bldg.

CEAS Colloquium: "The United Front in Communist Base Area Construction" with Dr. David Paulson, post-doctoral fellow from Harvard Univ. 4:15 p.m. L. H. Hoover Bldg., Room 238.

Western European Studies Lecture: "The Future of Detente from a British Perspective" by Sir Michael Palliser, former permanent secretary of the British Foreign Office. 4:15 p.m. History Corner, Room 205. Public cordially invited.

Japan Society/Committee for Art Film Series: "Seven Samurai" dir. by Akira Kurosawa. A village hires a band of samurai to save them from marauding bandits. 7:30 p.m. Annenberg Aud. $4 general, $3 students.

Condensed Matter Physics Seminar: "Why Are Actinides Interesting?" with G. R. Stewart, Los Alamos National Laboratory. 4:15 p.m. Applied Physics 200.

I-Center Other Cultures Film Series: "Anthony Burgess' Rome" introduced by the international literary figure; and "Mai Zetterling's Stockholm"—the actress-writer-director presents the capital of Sweden. 7:30 p.m. I-Center. 75 cent admission requested at the door.

Music Dept. Concert: Scott Whitaker, tenor, with Dina Klemm, piano. Love and Other Things. A recital of 20th Century Art Songs. 8 p.m. Tresidder Lounge. Free.

STARTS Open Mike: Sign up in STARTS Office. 9 p.m. Coffee House. Free.

FRIDAY, NOVEMBER 19

CEAS Chinese Archaeology Slide-Talk: "Dating of the Early Dunhuang Caves" by Prof. Su Bai, Beijing Univ. 3 p.m. Cummings Art Bldg., Room 2. Public invited.

Materials Science and Engineering Colloquium: "Materials Performance in Nuclear PWR Steam Generators" with J. P. N. Paine, EPRI. 3:30 p.m. Peterson Laboratory, Room 550A.

CEAS Concert: Chinese Folk Music by advanced students from the Shanghai Music Conservatory. 8 p.m. Tresidder Union, Room 281. Free and open to the public.

STARTS Great Directors Film Series: "Moses and Aaron" dir. by Jean Marie Straub. The resonant confrontation of Moses and his brother. 8 p.m. Geology Corner, Room 320. $3.75 general, $2.75 students.

Stanford Savoyards Production: Gilbert & Sullivan's "H.M.S. Pinafore, or the Lass that Loved a Sailor." 8 p.m. Dinkelspiel Aud. $5 general, $3 students. (Performance repeated tomorrow and Sunday, same details.)

Music Dept. Concert: Margaret Fabrizio, harpsichord. 8 p.m. Annenberg Aud. $4/$2.

Archaeological Institute of America Lecture: "Minturnae" by Brother S. Dominic Ruegg, F.S.C. 8:15 p.m. Room 370 (opp. the Physics Tank). Public invited.

STARTS Live Entertainment: Items to be announced. 9 p.m. Coffee House. Free.

SATURDAY, NOVEMBER 20

Perspectives on the Israeli/Palestinian Conflict: A presentation by an Israeli and a Palestinian. Edward Said, Columbia Univ., will speak on "The Question of Palestine Now" and David Amit, Hebrew Univ. of Jerusalem, speaks on "Lessons of Horror and Perspectives of Hope." 2 p.m. Annenberg Aud. Public cordially invited.

The Stanford Savoyards Production: See details for Fri., Nov. 19.

Music Dept. Concert: David Ng-Quinn, piano. Works by Bach, Beethoven, Debussy, Bartok, Brahms. 8 p.m. Tresidder Lounge. Free.

STARTS Live Entertainment: Program to be announced. 9 p.m. Coffee House. Free.

SUNDAY, NOVEMBER 21

University Public Worship: Student Worship Service, 8:30 a.m.; Wendy Smith, assoc. dean of the chapel, 11 a.m.; Catholic Mass, 4:30 p.m.; Evening Communion in the Memorial Church Round Room, 6 p.m.

Libraries Associates Lecture: "Lady Mary Rides Again: The Significance of Lady Mary Wortley Montagu Then and Now" by Dr. Robert Halsband, prof. emeritus at the Univ. of Illinois. 3 p.m. Annenberg Aud. Public cordially invited.

ASSU Sunday Flicks: "Everything You Always Wanted to Know About Sex." But were afraid to ask. 7 & 9:30 p.m. Memorial Aud. $1.50.

Stanford Savoyards Production: Final performance of "H.M.S. Pinafore." See details for Fri., Nov. 19.

EXHIBITS

Paul Harris—Still Life. Stanford Museum. Through January 2.

Venice in the 18th Century. Paintings, drawings, prints and decorative arts. Stanford Art Gallery. Through December 19.

Before Darwin and After. Books and other materials dealing with Charles Darwin, his theory and its impact. Second floor, West Wing, Green Library. Through November.

Wood Construction and Process Sculpture by E. David Camardo. For library environment. The Jonsson Library of Government Documents, Green Library. Through December.

Ansel Adams. Books, letters, photographs. Exhibit coordinated by the Stanford Museum and the Dept. of Special Collections. Green Library, Special Collections Gallery, second floor, West Wing. Through November 24.

The Orchid Observed. Five centuries of botanical illustration and exhibit of books from the collections of William K. Glikbarg and the university libraries. Lurie Rotunda, Dept. of Special Collections, second floor, West Wing, Green Library. November 15-January 11.

Maps Are For Use. An assortment of maps and related cartographic reference works available from the Central Map Collection. Meyer Library Lobby. Through November 19.

Acrylic on Canvas Paintings by Win Belton. Bechtel International Center. Through November.

Views Through a Natural Lens and **California Vignettes.** Color photographs by Damien Kuffler. Tresidder Coffee House and second floor gallery. Month of November.

Photographs by Marianne Skogh. Gold Lounge, both entries, and other locations. Stanford Faculty Club.

VISITORS FROM OTHER COUNTRIES

Nov. 15. Mr. Fernando Lopez Imizcoz, producer for the government TV station. Argentina.
Study group in biotechnology. City of London Polytechnic, England.
Dr. Joseph V. Mtangsi, chairman of food research, Yaounde University, the Cameroons.
Prof. Per Schiolddorg, psychologist, Univ. of Oslo.

Nov. 18. Group of 12 vocational educationists, Thailand.

For further information, please call Maria Bun, International Visitors Office, 497-1984.

Calendar to go on-line; but don't forget the forms

The Calendar of Events, like so many other things on campus, will soon be on-line and available to anyone who has a computer terminal.

Events for the calendar have always been submitted in writing, but now they must be submitted on forms which present the information in the proper order for feeding into the computer.

Forms will be sent to major presenters as soon as they are delivered from the printer. Others who want copies in order to list events in the Calendar should call Events and Services, ext. 7-2551. When the Calendar finally is on-line, *Campus Report* will provide directions on calling it up.

CAMPUS REPORT

Volume XV, Number 9 | A publication for Stanford University faculty & staff | November 17, 1982

Hastorf sees $10 million, three-year crunch

Stanford faces a three-year $10 million belt-tightening effort, University officers told the Faculty Senate Thursday, Nov. 11.

Caused mainly by slower than expected growth in research volume, the crunch may require operating budget cuts totaling about five percent in this period, Provost Albert Hastorf said.

The University still hopes to achieve a balanced budget this year through voluntary holdbacks and cuts in facilities reserves, he added. But it could sustain a $1 million operating budget deficit in 1983-84.

The outlook for research funding is particularly uncertain. Cutbacks in energy and social science research, changes in indirect cost recovery rates, and questions about continued commitment to the principle of full recovery for research costs make present estimates "very tentative," Hastorf emphasized.

Besides the "vagaries" of research, changes in federal and state student aid programs, inflation, and "our own initiatives" to improve education add to the budget crunch, Hastorf said.

Provosts at other universities report similar problems "last year for some, this year for others," Hastorf said. "Ours will continue."

Last year, Northwestern froze faculty and staff salaries, "a bold move, and one I'm desperately anxious to avoid," Hastorf said.

MIT has announced plans for three-year cuts amounting to $10 million in its operating budget. Indications are these

Humanities Center big benefit to resident fellows, Corn says

The most valuable facet of the new Stanford Humanities Center, according to Wanda Corn, associate professor of art, is the relationship of the Center's resident fellows.

"Our collegiality makes time mean something," she says.

For the 14 humanities fellows—six Stanford faculty members, five Stanford graduate students, and three faculty from other universities—their year here offers that great intangible benefit, time to do research and, in many cases, work toward completion of a book.

But the fellowship is a firm two-way street: each fellow must offer something specific to Stanford. Some teach a course, others direct a seminar, still others will take leadership roles in conferences.

The entire program, now in its first year, has just received a strong vote of confidence from the Mellon Foundation. It has made a $250,000 grant, available over five years, to bring to the Stanford Humanities Center two or three non-tenured faculty from universities not offering substantial doctoral work in their fields.

This grant, according to Prof. Ian Watt, the Center's Director, must be matched by other gifts. Efforts toward this goal are now in progress. To date, Watt says, the Center's support totals well over one million dollars. It includes a large gift from Mrs. Marta Sutton Weeks, part of which goes into endowment and part to support faculty Fellows; $500,000 from the Pew Foundation, spread over three years; some other donations; and a small amount of start-up funds from Stanford.

"The majority of our support comes

Kick the two culture habit, Adams urges

Americans should try to kick the "two culture" habit spawned by C.P. Snow, Prof. James Adams, director of the Stanford values, technologiy and society program told engineering alumni Saturday, Nov. 13.

Among students today, he observed, "the stereotyping is much as it was when you went to school." Students in the physical sciences, engineering, and preprofessional programs are often regarded as "techs," while those in the humanities and social sciences are considered "fuzzies."

"The 'techs' are considered by the 'fuzzies' to be nerds, undoubtedly compulsive in everything except dress and social comportment, incapable of interesting thoughts, and probably preferring to talk with each other about problem sets," Adams said.

"The 'techs," in turn, consider the 'fuzzies' as being only marginal at reaching logical conclusions, probably unable to keep their bicycles in operation, and completely unable to support themselves after graduation."

While picking one of these two cultures enables people to specialize and enjoy the comforts of their own "tribe," the personal and social costs are "staggering," Adams said.

"My very soul is scarred by my undergraduate days at Caltech, because at that time most women belonged to the other culture. It's no fun to be 18 years old and forced to prove that you are *human* before you can even get around to proving you are *desirable*. . . .

"Even more critically, we pay a personal cost in our intellectual life and our problem solving ability. The highest forms of intellectual stimulation require the ability to generalize over concepts that range across both cultures.

"Effective communication requires elements from both cultures, as does successful education. Creativity and the ability to respond to change require the ability to be cross-cultural, to deviate from the usual problem solving patterns."

Happily, both in his own experience and that of engineers in his audience, he

Renowned Mexican writer Juan Rulfo spent the first week of November at Stanford, participating in seminars, holding office hours for faculty and students, and giving noon and evening talks. Above, Prof. Fernando Alegria (left), who appeared with Rulfo in a videotaped conversation for the Stanford archives, escorts him on a campus walk. Rulfo, whose *Pedro Paramo* is considered by many to be the most significant Mexican novel ever written, also spoke at the University of Santa Clara and attended an autograph party at Bookworks in San Francisco.

Ingle receives Earth Sciences teaching award

Prof. James C. Ingle, Jr., new chairman of the Geology Department, has been honored by Dean Allan Cox as the outstanding teacher of 1982 in the Stanford School of Earth Sciences. This teaching criterion, which included a $2,000 award, is the first ever presented by the School.

Cox praised Ingle as "a teacher whose enthusiasm for oceanography and micropaleontology is infectious.

"We run a serious risk every year that the 280 students who take his introductory courses will all become micropaleontologists and saturate the world job market. Jim's lectures are full of substance, wit, and style. I never pass up an opportunity to hear him speak and the students rarely do either—which is the ultimate accolade of a lecturer."

Prof. George Thompson, who chaired both the Geophysics and Geology Departments last year, cited Ingle as "a standout candidate" in a department known for excellent teaching.

Thompson, now chairman of geophysics, also called attention to favorable comments from the senior survey. One student said he had enrolled in the Oceans course as "a painless way to fulfill my math/science requirement" but became engrossed in the subject because of Ingle's enthusiastic presentation. This student added that Ingle "is the standard by which I measure the teaching ability of other professors."

James Ingle

All of the 139 students who responded to the course evaluations regarding the Oceans class for 1981 credited Ingle with above-average knowledge of subject matter, and 121 of them gave him the highest possible rating on this criterion.

As a researcher, Ingle studies micropaleontology, emphasizing application to the history of Cenozoic and Mesozoic marine sequences around the North Pacific margin, the paleoceanography of the Pacific, marine correlations, and biostratigraphy. His courses include Introduction to Micropaleontology, Advanced Micropaleontology, and Microfossils in Exploration Geology.

Even before he received his Ph.D. from University of Southern California in 1966, Ingle was singled out for awards in his field. He received the W. A. Tarr Award of Sigma Gamma Epsilon honorary fraternity in 1958 and was one of five nominees for the Newcomb Cleveland Prize of the American Association for the Advancement of Science in 1962. He was a fellow of the Geological Society of America in 1973 and of the California Academy of Sciences in 1975.

Ingle came to Stanford as an associate professor of geology in 1968 after spending the previous year as visiting research scholar at Tohoku University in Japan. He became professor of geology and associate chairman of the department in 1981 and chairman of the department in 1982. In 1981 Ingle was invited to speak at the NATO Advanced Study Institute on the Geological Record of Coastal Upwelling, Portugal.

Last year he chaired the U.S. Working Group, International Geological Correlation Project 114 meeting of the Pacific Neogene Correlations in Osaka, Japan, and was coorganizer and leader of an international field conference on the Neogene/Quarternary boundary in the southwestern U.S.

Peter Coutts Hill condominiums

Stanford University is accepting applications now for rental of the new Peter Coutts Hill Condominiums.

Rental units will be available in December, 1982. Rental agreements, are month-to-month.

Preference in rentals will be given to members of the Stanford community (faculty, staff, students, etc.) and its affiliates. Families with children are welcome.

Floor plans of the various unit types and rental applications are available from the Peter Coutts Hills rental office, 138 Peter Coutts Circle, Stanford, Calif. 94305; (415) 493-1471.

The unfurnished average rents for the various types are as follows:

A-1	(2br/2ba)	$930
A-2	(2br/2ba/study)	$1,010
A-3	(2br/2ba/study)	$930 (handicapped unit)
B	(2br/2ba/study)	$985
C-1	(3br/3ba)	$1,095
C-2	(3br/3ba/study)	$1,200
D	(3br/3½ba/study)	$1,260

These are average monthly rents. The actual rent on any particular unit may vary slightly according to unit location. Additional rent of $50 per month will be charged for each unrelated adult in excess of one per unit.

People

Sidney Hook, senior research fellow at Stanford's Hoover Institution, has received a letter from President Reagan calling him "an intellectual mainspring of our country."

Professor emeritus of philosophy at New York University, Hook was described by the President as America's "global philosopher of freedom through more than half a century's continuous struggle against the totalitarian ideologies of left and right.

"You were right in identifying the danger of Soviet totalitarianism immediately after [World War II]. And you have fought throughout your career for the right of reasoned discussion in the university setting on all issues," Reagan said.

Hook, a fervent democrat and anti-communist, is well known for his conservative views on defense and foreign policy. He has published more than 1,000 articles, reviews, essays, and books, including *From Hegel to Marx*, and *Reason, Social Myths and Democracy*.

Reagan congratulated Hook on his upcoming 80th birthday.

Sigma Chi award supports Stanford

The Stanford chapter of Sigma Chi has been selected by the national Sigma Chi Foundation as a winner of the Peterson Significant Chapter Award, the highest award given to an undergraduate chapter.

This award is presented annually to chapters which achieve distinction in 10 major fields of fraternity operation.

Having received a large plaque and check, the Stanford Sigs will present the check to Stanford President Donald Kennedy for either scholarship counseling or the purchase of one bollard.

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.

Published by the Stanford University News Service, Patricia J. Black, editor; Karen Marman, design assistant; Charles Painter and Ed Souza, photographers; Medicals news editor, Lisa Ames, ext. 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

The Van Dykes marry science and art in a remarkable book

BY DONALD STOKES

Milton Van Dyke and his wife, Sylvia, had their world turned upside down within the space of 12 minutes.

On Nov. 15, 1967, they became, to their complete astonishment, the parents of identical male triplets.

Today, 15 years later, they have produced another remarkable creation.

Prof. Van Dyke, one of the pioneers of space missile technology, and his wife have published a book that may rank as a landmark in the marriage of science and art.

The book is *An Album of Fluid Motion* (Parabolic Press, P.O. Box 3032, Stanford, Calif. 94305; 176 pp., $20). It captures, in photos of remarkable beauty, the wonders of fluid flow—the study of the motions of liquids and gases past bodies.

The Parabolic Press is actually the Van Dyke's dining table. It was here that the book was laid out and assembled. "We even gave up that table during the Christmas season and used other odd tables, but our friends understood," says Sylvia Van Dyke.

Van Dyke, a striking figure with his grizzled crew cut and goatee beard, told a campus interviewer the story of how the idea for the book began. "It came to me 24 years ago, when I was teaching at the University of Paris," he said. "While browsing through the books on the Left Bank I came across the beautiful *Atlas de Phenomenes Optiques*.

"As an engineer absorbed in fluid mechanics I said to myself, "Why don't we have something like this for fluid motion?"

Van Dyke often thought about the idea as time went by, and early in 1980 he began to work seriously on the project. He set out to gather photographs from all over the world, and from a long way back in time, in order to form a collection of visual representations of fluid mechanics.

By corresponding with colleagues and looking through journals he located outstanding photographs taken by scientists throughout the world during the last century. He wrote to each one or to his estate, explaining the project and inviting cooperation.

The response was gratifying; as months went by he slowly accumulated hundreds of photos that were both eye-catching and useful to the study of fluid motion.

The tedious work of securing and assembling the photographs took Van Dyke and his wife more than two years. When they had collated most of the material, their inquiries revealed that if the album were to be published commercially the retail price of each volume would be prohibitively high for students, whom the Van Dykes visualized as finding the work most useful.

"Sylvia and I decided to publish it ourselves," said Van Dyke.

They badly underestimated the time and labor required to prepare final copy for the printer. Evening after evening they painstakingly considered which photos to use, how to display them, how to caption them vividly and accurately.

Each of the nearly five hundred photos chosen, with draft text to accompany it, was mailed back to the contributor for approval. This meant correspondence all over the world.

In May 1982 came the day that Van Dyke had first dreamed of 24 years before.

The Van Dykes had in their hands first copies of the 176-page book, with its glossy photos and carefully researched text.

The response from the professional world was enthusiastic. *Scientific American*, in its issue of October, 1982, devoted a whole page of unstinted praise to the book and ended by saying "This collection. . . will enduringly reward many owners. What technical library can be without it?"

The frontispiece adds the dimension of history. It is a photograph made by Ernst Mach (whose name is used as a measurement of high-speed flight) in Prague in 1888. It shows close up a brass bullet in supersonic flight. It was among the first of such pictures ever made, and shows the bow shock-wave.

The scientific purpose of the album is marked by the various sections, each of which illustrates a particular branch of fluid mechanics, from "creeping" to "supersonic" flow with other types such as "laminar," "natural convection" and "vortices" on the way.

A layperson, however, relishes the book for the sheer beauty of its images. Many of the photos capture esoteric echoes of ballet or music or abstract art. The final photo, which shows the flow effect of a disturbed rocket engine, could command a place in any exhibition of modern art.

Each photo combines beauty with a scientific truth, frozen in a millisecond of time. Sometimes the truth is one that can be revealed only in a photo. One example is the shot of a smoke-ring, which proves that the vortex ring is not a single closed "doughnut" as smokers may suppose; rather within it there is what Van Dyke would call a toroidal spiral, the outer sheath curling in on itself countless times.

The story of how that photo was obtained typifies the efforts that went into the creation of the book. "A student of mine had seen it in a paper published 20 years ago in a Canadian journal," said Van Dyke. "It turned out that the senior author was dead. But the student who was his coauthor, and now holds his chair, had one yellowed print that he was willing to lend us. And as you see, it is a masterpiece."

Van Dyke hopes to publish an augmented second edition of the book and once again he is inviting colleagues all over the world to send in suitable photographs.

Van Dyke was asked if he could put into layman's language what form of research he was engaged in.

"In this branch of engineering we are concerned with approximations," he said. "We assume that something is small, that the speed is slow, or the thickness of the plane's wing is not very great, and we usually take the first approximation.

"In my Ph.D. thesis I tried to improve on that by doing a second approximation. If one has a number of approximations one can turn them over to the computer to solve the routine arithmetic, which in a few minutes gives as many as twenty to a hundred or more approximations.

"A student of mine who made quite a name for himself in water waves did the 117th approximation.

continued on page 6

Sybil and I decided to publish (the album) ourselves. We badly underestimated the time and labor required to prepare final copy for the printer.

—Milton Van Dyke

To a fluid motion engineer, this is a Karman vortex street. To a layman, it is one of nature's beauties.

Lori Williams links bacteria fossils to hidden oil fields

A postdoctoral geologist at Stanford has been finding a "surprising correlation" between the fossil remains of a certain type of bacteria and the location of hidden oil fields.

Lori Williams is currently involved in one of three research teams exploring the terrain of California's Central Valley. Collectively called the San Joaquin Basin Project, the graduate field study program is headed by Steve Graham, associate professor of petroleum geology and is sponsored by 13 major American oil companies.

Williams has been examining rock types of Central Valley oil reservoirs in the Monterey Formation, a geological name first coined for a group of white-colored rocks which outcrop on the coast near Monterey. She has isolated the fossil remnants of a type of bacteria that appears to have contributed to the source of much of the oil that is being pumped out of oil wells in California every day.

Oil is generated deep beneath the earth's surface by the heating and breaking down of organic material (the remains of dead plants and animals) which has become trapped in certain layers of the earth's crust over many millions of years.

"Geologists might one day be able to use Lori's analysis of this bacteria and its distribution to better predict where companies should be drilling for oil," said Graham, who works closely with Williams as her adviser.

Bacterium associated with oil fields.

Bacteria as fossils

The bacteria she has found as fossils in the Central Valley rocks live in modern deep-sea sediments made up of the skeletons of billions of microscopic diatoms, a one-celled species of green algae.

"It's basically a recycling process," said Graham. These bacteria colonize and live off the remains of the diatoms and then, with time, decay into crude oil. Only the oil and the nonorganic diatom skeletons remain.

Displaying an array of beautiful geometric patterns, these silicate skeletons reveal the architectural complexity of nature. Intertwined throughout these fossil structures are remains of the bacteria that Williams believes to be a fundamental substance from which much of the oil in California is created.

Once the bacteria has been slowly transformed into oil over time, said Williams, it is hard to get the oil pumped out through the pores of these skeletal diatoms.

In answer to this problem, Graham and Williams have been involved in studies with Bill Brigham, Roz Fussihi, and Sidgi Abu-Khassim of the Petroleum Engineering Department, in which the rock reservoirs containing the thick tarry oil were heated to higher temperatures so that the oil became less viscous and flowed more easily through the rock pores. In petroleum geology, such a technique is called a "secondary recovery method."

"By chemical analysis, we're trying to 'fingerprint' this bacteria," said Graham, who indicated that some living specimen of the same bacteria have recently been dredged from deep waters off the coast of Santa Barbara.

When bacteria die and are buried in an aquatic environment that has a low concentration of oxygen (like the ocean bottom off the Santa Barbara coast), they become an excellent medium for the slow process of conversion into oil to take place. In such an environment, the water is usually so deficient in dissolved oxygen that few living things besides bacteria can survive in it.

Between five and ten million years ago, much of the San Joaquin Valley was covered by 2,000 feet of sea water. "The possibility of greater quantities of this type of bacteria occurring throughout the Central Valley area is very good, said Graham. Currently, several billion barrels of oil are known to exist in the San Joaquin basin.

"There's bound to be more," said Graham, "but probably not a startling amount because it's not a virgin territory; oil companies have been out there for a long time."

Graham asserts that this project does not attempt to be a consulting service to his oil company sponsors, but "we may be helping them out indirectly by providing some scientific data on why the oil is there."

Company sponsors

The 13 oil companies which are sponsoring Graham's project are: Chevron, Getty Oil, Occidental Petroleum, Superior Oil, Tenneco, Texaco, Gulf Oil, Marathon, Amoco, Union, Shell, Conoco, and Atlantic-Richfield.

Exxon removed its financial support this year, but its space was filled by Conoco. A few other companies may join the list soon because of their interest in a field trip Graham and his students led for the pacific section of the Society of Economic Paleontologists and Mineralogists this past summer.

Fellowship support

The money from firms goes to fellowships for graduate students, and also supports such research costs as equipment purchases, collection of a variety of analytical data, and field trips.

Williams coordinates the Monterey Formation study with the aid of three graduate students: Michael Kruge, Linda Weber, and Joyce Clark. In addition, Graham also oversees two other lines of research within the San Joaquin Basin Project.

Five masters students are currently involved in a geological study of a group of sedimentary rocks in the basin called the Temblor Formation. Scott Cooley, Matt Bate, John Kuespert, Phil Estes, and Happy Harun are studying the history of deposition of sandstones which crop out in the mountain areas on the western side of the San Joaquin valley.

Over many millions of years, the San Andreas fault has dramatically altered the topography of the mountainous areas that these students are studying.

Specifically, Bate works on rock outcrops in the vicinity of the city of Coalinga. Kuespert works on the marine deposits and nonmarine river channel deposits that underlie the nearby Kettleman Hills, just west of Interstate 5.

The third aspect of research in Graham's project is developed by Jim Ingle, chairman of the Department of Geology, and his Ph.D. student Bob Milam.

Their project focuses on an earlier period in the San Joaquin basin's history, prior to the time when continental plate collisions caused the birth of San Andreas fault system. Their study may shed some light on the processes that led to the widespread extinction of many groups of organisms at certain times in the past as, for example, the curious disappearance of the dinosaurs at the end of the Cretaceous time period 65 million years ago.

—Craig LaGrow

Willow Road extension plan includes El Camino barrier

A large "island" in the middle of El Camino Real in Palo Alto to prevent traffic from crossing the highway onto Alma Street is a major feature in a plan for a Willow Road extension submitted by Stanford to the City this week.

Frank Morrow, Stanford director of real estate, said that the intersection design is part of an application to build a two-lane extension of Willow Road from its present terminus at Arboretum Drive to a new terminus at El Camino.

The road is to be built through a vacant lot between the Stanford Shopping Center and San Francisquito Creek, Morrow said. The proposal calls for right and left turns only at the highway.

"We are well aware of the desire on the part of the City to prevent traffic from crossing onto Alma Street, so our consultant engineers have tried to devise an intersection arrangement that will make any crossing extremely difficult, as well as illegal," Morrow said.

The extension follows the outermost "barrel" of a four-lane road to El Camino that was approved by Palo Alto in 1978. The project was shelved, however, when it lacked enough votes to form an assessment district to finance the work.

The Palo Alto Architectural Review Board is expected to take up the application in December, after the city staff makes an environmental assessment. If required, a supplemental Environmental Impact Report will be prepared and heard over the next several months, as well. That process will culminate with two Planning Commission and two City Council hearings next spring.

Morrow said that the extension is needed to divert traffic now using the Shopping Center parking lot and private Stanford roads as routes to El Camino Real and to serve coming construction traffic in that area.

Stanford will build the road at a cost of $1 million, Morrow said. The proposal comes after completion of an $867,000 extension of Campus Drive to Junipero Serra Boulevard, and before the start of a $250,000 link of Welch Road across Pasteur Drive.

Oil prospecting technique used to study earth's crust

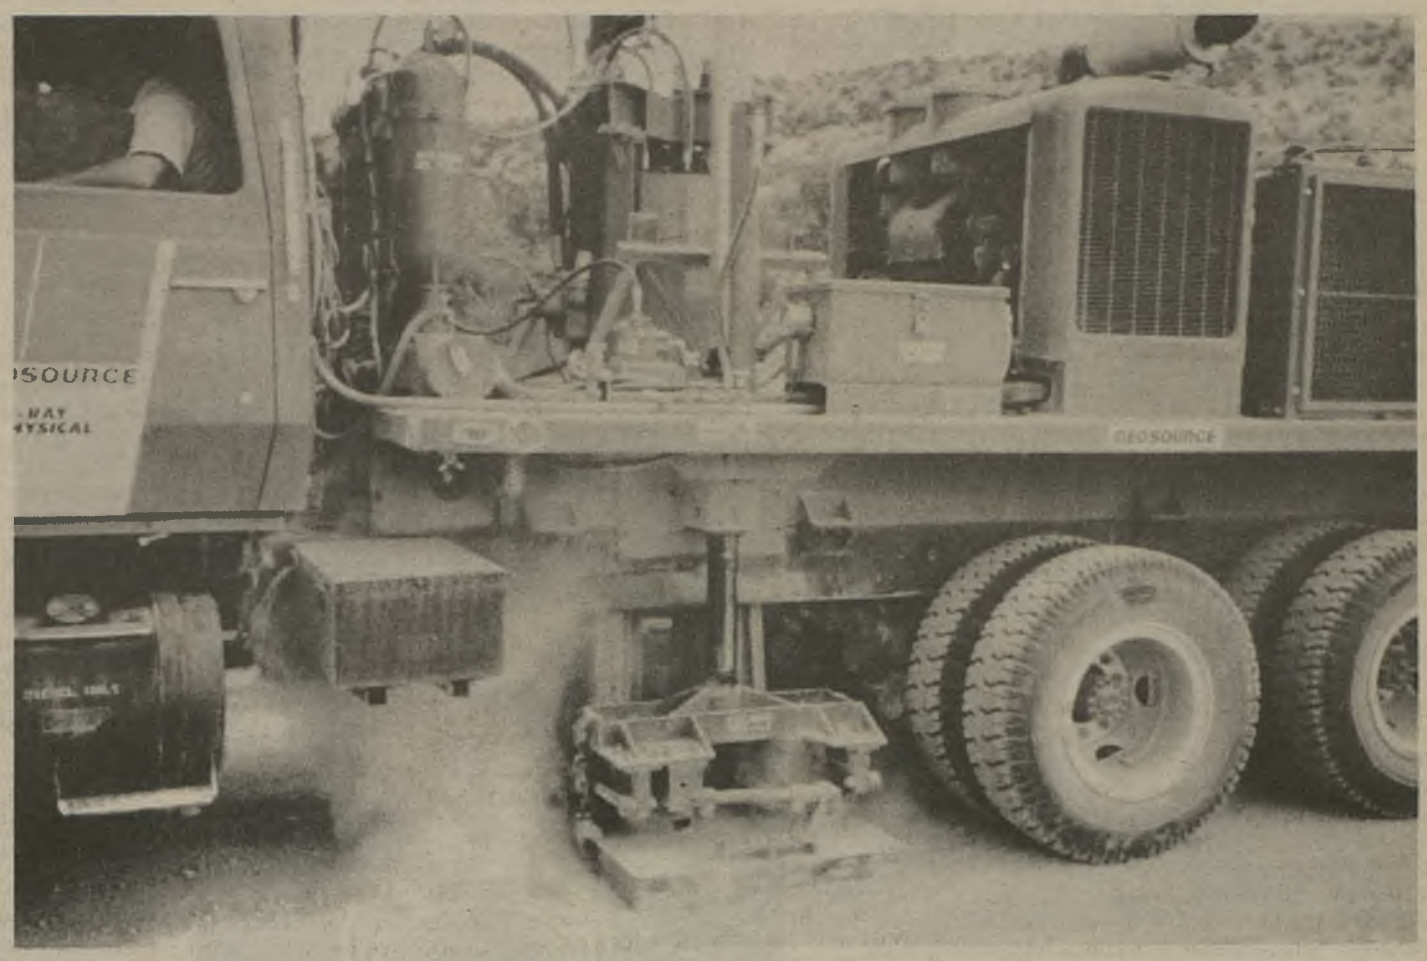
Researchers in Stanford University's Department of Geophysics are studying the earth's dynamic structure through the extension of a technique originally designed to discover oil.

The seismic reflection method, used by oil companies for several years, involves the projection of sound waves into the earth. Stanford geophysicists process and interpret deep seismic reflection data—the echos which are sent back from many miles under the earth's surface.

Deep seismic reflection profiling, according to Prof. George Thompson, chairman of the Departments of Geophysics and Geology, "is the extension of a standard but developing technique that's used in prospecting for oil, mainly.

"It's an extension of this beyond the depths where oil can occur, into the deep crust. . . so we have now basic scientific purposes rather than prospecting."

The crust is the outermost layer of the earth and ranges from three to 42 miles (5 to 68 kilometers) in thickness.



While Thompson described deep seismic reflecting as "basically the most revealing way to investigate the earth," he said the processing and interpretation of data presents a challenge to geophysicists because the sound waves get distorted underground.

Thompson likened the interference between the sound waves and the rock layers in the earth to a hall of mirrors, "where you get everything coming back in a highly distorted fashion."

Before Thompson begins his work on reflection data, the information is collected and processed. Most of the data collection is currently being conducted through Gornell University which contracts geophysical services companies to do the field work, according to Thompson. Stanford purchases magnetic tapes which store the data in digital form, he said.

The processing—which involves complex mathematical steps carried out on a computer and ends up with a cross section of the earth on paper—is carried out in cooperation with professor of Geophysics Jon Claerbout and members of the Stanford Exploration Project which he heads. According to Thompson, Claerbout has made great advances in the imaging of seismic data by computer.

When Thompson and a team of students receives the processed data, they interpret the information. Interpretation, according to Thompson, is determining "what (the data) means in terms of geologic structure."

Pad on truck sends seismic waves into the ground

Thompson's work concentrates on plate tectonics. This term refers to the idea that the earth is divided into about a half dozen major plates which move in relation to each other. The movements are responsible for the formation of the continents and the production of earthquakes, volcanos, and mountains.

"The best known, popularized occurence of this kind is in the middle of the Atlantic where you notice that South American and North America fit together with Africa and Europe," Thompson said. "The Mid-Atlantic Ridge is where the continents are still drifting apart. . . about five centimeters (2 inches) a year."

The occurrence that Thompson describes provides proof for the highly publicized theory of continental drift, developed by Alfred Wegener in 1915.

"The whole structured fabric of the earth we live on is a consequence of these plate movements, so part of our interest is to really understand the physical processes that are going on," Thompson said. He added that he and his co-researchers are not trying to predict earthquakes or the eruption of volcanos, but are "looking at the history of this over millions to hundreds of millions of years."

Typically, five trucks each weighing 18 tons (16,300 kilos) are sent to the research site. Hydraulic devices attached to the trucks' undersides are lowered until pads at the ends of the devices rest on the ground. Hydraulic power vibrates the pads, causing vibrations to be sent underground.

Thompson said the process is exactly like that used in the ultrasound imaging of fetuses, except that waves of lower frequencies must be used in seismic reflection work because the earth would absorb higher ones.

"Although we'd like to use those higher frequencies because they give you a better resolution, you can see smaller things, we're restricted to using waves that are generally in the range of about 5 to 50 Hz. (cycles per sound)," he said.

National Science Foundation grants support the field work, through Cornell, and students in the Department of Geophysics, through Thompson. Claerbout's Stanford Exploration Project is funded by a consortium from industry.—**Kristen Christopher**

Boskin, Shoven think election outcome bodes ill for Social Security reform

Prospects for sensible, long-term Social Security reform have worsened considerably since the elections, according to Stanford Economics Prof. Michael Boskin.

He and fellow economics Prof. John Shoven spoke at an informal seminar at the Center for Economic Policy Research at Stanford.

Boskin noted two "largely unreported" results of the election: 1) the fraction of the total voters who were elderly—over 65—among all those casting ballots rose six percent, and 2) the Republicans got only 50 per cent of the elderly vote, down considerably from 1978 and 1980.

Protected against inflation by the indexing of social security benefits, the elderly will grow "more and more vocal about no benefit cuts of any sort," he said. The present system "lumps together retired millionaires. . .with those at the bottom who probably aren't getting enough," providing benefits five times as great as their total contributions and interest earnings.

The indexing of social security benefits by prior Republican administrations "removed the political incentives for giving credit to those who reduce inflation," Boskin said.

Overall, the government faces "horrific" budget pressures in the next few years, Boskin said. Ultimately, this may result in a move toward value-added taxes, which are common in Europe.

Shoven said the fiscal problems make any major tax reform unlikely in the next few years.

If a value-added tax is imposed, it would probably be supplemental to existing income taxes, he said. "The outlook is for more taxes, not necessarily simplified taxes."

Shoven said it was politically "naive" to think that "the present tax system was screwed up by a bunch of bunglers in Washington." Political pressures for each of the preferences built into the present system would not likely be overcome by simply attacking all of them simultaneously through a flat tax.

One of the principal changes of a flat tax would be to shift the tax burden from the wealthy—who now pay about 30 to 33 percent effective rates—toward middle income families.

Proposals for a flat tax around 19 percent, developed by Stanford economists Robert Hall and Alvin Rabushka, would result in higher rates for most taxpayers. "As we get close to it, the flat tax will disappear," Shoven said.

Both he and Boskin indicated that the nation might move toward a consumption tax by liberalizing the present provisions for Individual Retirement Accounts (IRAs) and Keogh plans. These permit tax sheltering of savings until they are used for consumption, at which time they are taxed.

But Shoven noted that people may borrow funds for investment in IRAs, thereby obtaining tax deductions for the interest paid on the loans while sheltering income. This "raid on the Treasury" should be stopped, he said.

Prof. James Rosse, CEPR director, noted that one danger of the value-added tax is that it is "so hidden that no one is aware" of its impact on prices.

Boskin predicted an acceleration of previously scheduled social security tax increases over the next two years.

The outlook for the next 10 to 15 years is "much rosier," with progressive liberalization of IRAs and a gradual move toward first year "expensing" of all investment expenditures.

Van Dyke/ continued from page 5

People sometimes ask the point of this sort of thing. But George Gabriel Stokes, who really started water wave theory a hundred years ago, worked out the fifth approximation by hand; and it turns out that many more approximations are necessary to capture the highest wave."

Asked whether his research was directed to specific problems, Van Dyke replied that he was concerned more with techniques. "My latest paper concerned shock waves, and could have been of interest to scientists working on the fusion process, but the work was not done with that in mind."

Van Dyke recalled that a student had recently said to him, in mild astonishment: "You are still working in the same line of research that you did for your Ph.D.?"

"It's true," said Van Dyke. "I am still pursuing the same vein of research. I am a little obsessed with the computer these days, but apart from that there is still so much to learn, and to teach, about fluid mechanics.

"The flow of air over planes or missiles, for example, is something that can be visually understandable if one uses appropriate techniques. Occasionally people can see the process for themselves without any aids—such as by watching contrails from highflying planes, or the progress of clouds.

"Scientists use all sorts of means to make fluid mechanics visible. In the wind-tunnels we use a wide variety of methods to trace the flow, sometimes aluminum dust, or fluorescent dyes. My colleague Steve Kline (professor of mechanical engineering) has an interesting method of using hydrogen bubbles."

Van Dyke met his wife Sylvia when she traveled from her native England to visit a long-time pen pal in Modesto, California. They were married in Memorial Chapel, Stanford, in 1962. Their daughter, Nina, is today a sophomore at Stanford, living in Toyon Hall. Their triplet sons are sophomores at Gunn High School.

"The boys probably owe their lives to the fact that they were born at the Stanford University Hospital," he said. "Triplets had not been expected, and when they were born two months prematurely, they weighed only about three pounds each. Very intensive care was necessary, which fortunately Stanford is well equipped to give.

"Parents of twin children sometimes say to us, 'We know what you have been through.' But they don't. That third one is not just a third more, but an exponential increase.

"We didn't have any hired help; but my mother and father who were then in their seventies, came up from Campbell three nights a week so that I could prepare my lectures. Later my mother-in-law came from England for a year."

Are your sons very much alike today? he was asked.

"No, they never have been. Each has his own personality and style. They rarely dress alike or think alike."

Stanford—and particularly the School of Engineering—seems an oasis of academic tranquility to Van Dyke. Although he was raised in an academic family, he had no intention of going into teaching, for he experienced as a boy what he calls "the seamy side of academe."

His father was a professor of mechanical engineering who served on the faculties of a number of colleges in the Middle West. During the Depression he changed his posts frequently, and young Milton went to one elementary school after another, in various states.

"Everywhere it was the same," recalls Van Dyke. "Those were difficult economic times and, perhaps for that reason, every faculty seemed to have its intrigues and feuds. In growing up I heard all about the worst side of academic life—presidents who were fired and deans who were bastards; all the bickering and jealousies. . . ."

He broke off, smiling. "It was the same everywhere, until I came to Stanford. I came here 22 years ago at the invitation of Nicholas Hoff and Fred Terman. I came here expecting it to be as bad as all the other educational centers I had known, and I was never more surprised in my life.

"At Stanford I have never known anything but friendliness and a family atmosphere."

He mentioned his experiences at another leading institution in California and commented, "It was so bad that when you gave a party you had to do research to make sure that you didn't invite the wrong people to meet each other.

"I still marvel at the pleasantness here. So far as I know, in the School of Engineering at Stanford, there is not one person who is not speaking to some other person.

"I have served under three deans, all good men, and I have received nothing but kindness and helpfulness here."

This view of a smoke ring shows it is not a true ring, but a 'tightly wound toroidal spiral.'

In spite of his daunting experiences in the Mid-west, and temperatures there which sometimes reached 47 degrees below zero, he has fond memories of such places as Nebraska and North Dakota. "I wish I could bring my kids up there."

For what reasons?

"The son of the governor of the state and the son of the town drunkard were in one of my classes. I met such a wonderful cross section of types. Sometimes I fear that in spite of the magic of Stanford, and the wonderful life that is possible here, it is a very closed world for a child to grow up in."

Van Dyke received a full scholarship to Harvard, and went there with the idea of following his father into some form of engineering. He was not drawn at that stage to academe, partly because of memories of his father's experiences.

He studied engineering sciences, and because World War II was on, he obtained his bachelor's degree in three years by taking summer courses.

He joined the predecessor of NASA (then called NACA) at Ames and joined a research group that was building wind-tunnels to study how airplanes could fly at the speed of sound. The chief of that group, Prof. Walter Vincenti, is today his colleague in the next office at Stanford.

Others from that group who are also at Stanford include Dean Chapman, adjunct professor of aero/astronautics, and Prof. John Spreiter, mechanical engineering.

The Ames group was incorporated into the Navy, and Van Dyke recalls having to do "shore patrol" in Palo Alto, which at that time was a sleepy little town, without any bars.

He went to CalTech for his Ph.D. as soon as he got out of uniform. By this time he knew that he wanted to continue in fluid mechanics, and he concentrated on that line of research. On returning to NACA in 1950 he turned from wind-tunnel experiments to theoretical research.

In 1953 he was awarded a Fulbright grant and Guggenheim fellowship and went to Cambridge, England, where he spent a rewarding year before returning to NACA. In 1958 he was invited to teach at the University of Paris. Between spring and fall of that year he learned French well enough to lecture.

While he was in Paris he had one of the happiest surprises of his life. He received an invitation from Fred Terman, legendary founder of the Stanford School of Engineering, inviting him to join the faculty. "It never occurred to me to say 'No,' and I arrived on campus in 1959. I've been happily here ever since."

As early as 1958 Van Dyke discovered a new mathematical technique to aid the design of ballistic missiles. This discovery aided the description by mathematical means of the way air is shoved aside as the nose cone of the ballistic missile plunges through the atmosphere at thousands of miles an hour. As the new method could be adapted to computers it opened up new possibilities for improving the design of missile nose cones.

Van Dyke is a modest man and he is reluctant to talk about his successes in research, which have earned him membership in the American Academy of Arts and Sciences and the National Academy of Engineering. He conceded that engineers all over the world were—and still are—anxious to find better ways to calculate fluid flow at super-speeds, and that the Americans and Russians have poured large resources into finding the answers.

"No, it's not easy," he agreed. "All sorts of methods were being tried, and mine was to try to do it purely analytically without any numbers. In the end, in desperation, I did it by a numerical method." He waved his hands in dismissal of the subject: "What was written about my methods was somewhat exaggerated. The Russians have their methods, we have ours.

"When I came to Stanford I started working with some new techniques I had learned from my professor at CalTech, Paco Lagerstrom. A layman would probably find them hard to understand and not of much interest. They were so-called perturbation problems, and I got some of my Ph.D. students working on some of the associated research."

Van Dyke wrote a book on the subject in 1964. He agreed to the interviewer's suggestion that the book had been "quite a success." He republished it himself, in 1975, in order to keep the cost down. The book was translated in the Soviet Union, and Van Dyke is one of the few authors who ever received and was able to make use of royalties from the Russians.

"I received 300 rubles," he said. "While my family and I were touring the Soviet Union in a Volkswagen bus I was involved in an auto accident, and the 300 rubles just about covered by liability."

For the last 10 years Van Dyke has been trying to find in his research "some sort of compromise between the purely analytical on the one hand and number-crunching on the other.

"I think there is room for some judicious combination of analysis and computing," he said. "We are surrounded by number-crunchers these days. People put their equations through the computer, and in a few hours a solution comes out."

A few hours? an interviewer asked. Did the computer take that long?

"Yes, when billions of figures are involved." Van Dyke recounted an experiment which had been conducted by a colleague at another university; it had taken the computer a year of continuous operation, day and night, to come up with the required solution.

At this point in the interview one of Van Dyke's sons, Brooke, entered the office and asked if he could examine the computer, or part of one, which was being built by a colleague down the hall. Van Dyke escorted the boy to the other office and came back beaming.

"You see!" he smiled. "The computer is taking over—no, I don't really believe that. The computer will never do as much as the human mind."

New program links Stanford, community-based job training

Ann Williams no longer has to listen to the sound of traffic passing by during commute hours while she sits at home hoping to receive a phone call from a prospective employer.

Thanks to a unique employment program at Stanford, she is now a part of the commute.

Williams' clerical training at Opportunities Industrialization Center West (OICW) in Menlo Park had provided her with specific skills but, until her recent appointment at Stanford, employers were more interested in her practical experience than her job potential and desire to learn.

The Stanford Employment Experience Program (SEE) has been instrumental in bridging the gap between community-based employment training programs and the University.

SEE is designed to assist the University in meeting staffing needs while making a positive impact on affirmative action goals. The program is targeted for, but not limited to, the economically disadvantaged, handicapped, and minority populations.

Program participants are classified as trainees for six months while receiving on-the-job and other training to develop the full range of skills required for the position. Supplemental training, evaluation, and counseling services are provided by the SEE program staff.

"Every job requires a period of training or adjustment," according to program coordinator Michael Britt.

"Employment professionals and placement specialists have put several excellent candidates behind the experience eight ball. This program is for people who have taken the time to acquire marketable work skills and need a chance to demonstrate their employability."

A key component in the success of the program has been the careful selection of supervisors to work with candidates placed by SEE. "Supervisors work with our candidates, from the prospective of 'I'm responsible for. . . ' as opposed to, 'I'm in charge of. . . ,' " says Britt.

Roberta Bernstein, a program supervisor in the Pathology Department, thinks the program is a success.

"All in all I am very pleased with the SEE program and I would use it again," she says. "We agreed to take a trainee for the position, and the staff agreed to help with the training."

The program affords a supervisor the opportunity to work with a candidate who, for the most part, has no rigid, preconceived notion about his or her job. Supervisors can mold their ideal coworkers as a result of the on-the-job training format used by SEE.

"We're not working in an environment where the primary goal is to secure a monetary profit, but the services provided by SEE are very cost effective," said Britt.

This is a program with worthy goals. . . . Here in Business and Finance we have had six SEE people. Four of them have successfully completed their training programs and have achieved nontrainee status, and the other two are still in the training program.

—Bill Massy

Supervisor Roberta Bernstein (standing) and trainee Ann Williams of the Pathology Department think the SEE program is a success

"Private industry has invested several hundred thousand dollars in professional training staffs and consultants, in addition to taking advantage of government-sponsored training programs to supplement the salaries of trainees. Stanford's monetary investment, for obvious reasons, does not come close to that of private industry, but the commitment is solid." The following is a list of the cost-effective features of the program:

* Staffing officers save a tremendous amount of time during the screening and placement process;
* Supervisors are aware of the performance proficiency of each candidate *before* he or she is interviewed or placed;
* Supervisors are provided with assistance form the SEE staff for job-related training.

"They sent me a person first who was their top applicant," says Bernstein. "I thought it was a nice idea that they were screened, because these people were trainees and would not otherwise have had a chance to compete in the marketplace with other trained applicants."

Williams, who works under Bernstein's supervision, agrees.

"I would probably still be looking for a job if it weren't for the program," she says. "I suppose I'd be looking through temporary services, or doing things I wouldn't really enjoy."

Networking has been a major obstacle for the program.

"One of our greatest challenges has been to get staffing officers and supervisors to make use of the services provided by SEE," states Britt. "We have constantly encountered a major bottleneck when we attempt to implement the program at a few staffing officer and supervisorial levels. We can't be effective if departments refuse or cannot make jobs available for the program."

SEE was successful in securing a specific number of job commitments during the proposal stage for the program from each University vice-presidential group. However, the tremendous drop in the job attrition rate has reduced the availability of jobs for the program. Requisitions for new jobs have declined. Many departments are attempting to exercise fiscal restraint by not filling vacancies or consolidating and reorganizing the duties of their staff.

. . . we considered the program experimental in this area last year, and we concentrated the efforts on a few select departments. Based on the qualitative success of that experiment, we have now expanded it to the entire vice-presidential area.

—Albert Hastorf

The SEE staff has focused on the qualitative aspect of the program. "Employees placed by SEE are some of the best-informed staff members on campus," boasts Britt.

Program participants attend SEE-sponsored workshops on financial management, sexual harrassment, career development, survival skills, and telephone techniques. Regular individualized training activities are offered by the SEE staff at the job site.

"The training has helped me immensely," says Williams. "When I first came to the program there were some things that I had forgotten, or that I never knew how to do."

Workshops are held during the noon hour to minimize the amount of time program participants spend away from their worksites and to afford supervisors an opportunity to attend.

Britt, who earned his doctorate in education at Stanford, is convinced that applicants hired through SEE will have long and successful careers at Stanford.

"They're good workers with a strong sense of loyalty and dedication," he says. "Very few people were willing to give them a chance to succeed in the past."

The program has a 94 percent success rate in placing candidates in positions on campus (four candidates were promoted to nontrainee status before their six-month training periods were over).

"We'd like to bring the program closer to staffing officers and supervisors," states Britt. "We always extend them invitations to visit the community training centers working with the program. We're always interested in talking to anyone considering taking advantage of the excellent services provided by SEE."

The agencies working with SEE are as follows: San Jose Indian Center, Goodwill Rehabilitation Center, Mayfield Training Center, Center for Employment Training (San Jose), Mid-Peninsula Youth and Community Services, Veterans Outreach, Sensory Aids Foundation, American Council for Nationalities, International Rescue Committee, Foothill/De Anza Community College District, MAEP-Indochinese Refugee Center, Opportunity Industrialization Center-West, and the State Department of Rehabilitation.

They were carefully selected according to a set of criteria developed by Britt. They include: 1) target population served; 2) applicant participation in the community program; 3) quality of training programs; 4) job retention and placement record; 5) funding sources; 6) proximity of agency to Stanford; 7) possible impact of agency referral on Stanford's affirmative action goals; and 8) the agency's follow-up programs.

Cronbach, Shapiro write book on the intricacies of evaluating programs

Program evaluation is an art, Emeritus Prof. Lee J. Cronbach declares in a new book, *Designing Evaluations of Educational and Social Programs* (374 pp. cloth, Jossey-Bass).

"There is no single best plan for an evaluation, not even for an inquiry into a particular program, at a particular time, with a particular budget," he declares.

But professionals are now close to agreement on issues hotly debated in the past: "For example, some writers urge the evaluator to apply his own best judgment to the facts and recommend a social action. Others want the evaluator to act as the eyes and ears for a pluralistic community, keeping his social values out of what he says. Everyone, however, seems to agree that the community is pluralistic and that the evaluator should acquaint himself with what subcommunities believe and care about."

Developing an evaluation is an exercise of the dramatic imagination," Cronbach declares.

"No one learns to plan and conduct evaluations from a book. The way to learn is to try and try again, part of the time under circumstances where a more experienced practitioner can comment on plans and suggestions.

"Not many would-be evaluators have that opportunity. Some learn the business from the bottom up by signing on with a contract research organization; in a large firm, however, junior members are not likely to participate in much of the planning or to gain experience with a variety of styles.

"The evaluator is in many cases the only person free to roam nearly everywhere and talk to nearly everyone, and so he can form a picture of the situation available to no one else. Using that opportunity tactfully requires maturity rather than expertise. Experience and specialized knowledge are bound to help—not in eliminating difficulties but in supplying more and more tactics for getting around them."

Cronbach holds the Vida Jacks professorship, emeritus, in the Stanford School of Education. His book was written with the assistance of Karen Shapiro.

Help Center use rises steadily

The Stanford Help Center, which celebrated its fifth anniversary Sept. 30, has seen use of its services rise from 137 in 1977 to 1,419 this past year, according to a newly released annual report *(see below)*.

Besides its personal counseling services, the Help Center has added to its offerings: lectures, seminars, and workshops on subjects like health maintenance, money management, improving work and family relationships, and home protection.

Groups for single parents, older people living alone, and wives of medical residents provide support networks for those whose families don't fill that role.

Most of the Help Center's activity has centered on personal or family problems that adversely affect health and work productivity. However, staff members, managers, and supervisors may make appointments to consult on work-connected problems, providing they are not more properly the business of Employee Relations—e.g., grievances and individual job evaluations.

The Center marked its fifth anniversary with a reception which honored retiring David Kaplan, who is still a part-time consultant.

Help Center has aided nearly 3,400 faculty, staff, and family members

Following is the annual report of the Stanford University Help Center for the period Sept. 1981, to Aug. 1982. It was written by David M. Kaplan, Ph.D., who retired as director Sept. 1 but continues as a Help Center consultant.

This fifth annual report consists of a review of the first five years of Help Center operations rather than of the past year, which has been our custom. During this five-year period a variety of services for faculty and staff have been instituted and the Center staff has expanded modestly (four FTEs, including an office assistant position) to achieve our objective of serving 10 percent of the Stanford work force each year.

CENTER PHILOSOPHY

Although university and industrial employee assistance programs are organized primarily to provide clinical services for a minority of "troubled" employees, Stanford's program is unique in its concern for the *total work force* and for organizing a program that seeks to protect and enhance the health and productivity of all members of the university work community. As a direct consequence of this emphasis, prevention, wellness and self-care are the watchwords of our program.

HEALTH EDUCATION

Our educational activity, which is broadly concerned with enhancing the individual's ability to care for his own needs and to cope with normal problems of living, is a central Center activity. Through lectures, seminars and workshops, which are offered regularly throughout the year, information is provided to Stanford personnel on a wide variety of topics—e.g., health maintenance, money management, ways of improving work and family relationships, methods of protecting the home and family from criminal intrusion and assault, etc. In addition to those classes that Center staff provide, we have the ability to offer workshops on a wide variety of subjects that are requested by faculty and staff. Individuals on campus, with diverse talents and expertise, enthusiastically lead many of our educational offerings.

COUNSELING SERVICES

Since each of us, in the course of living, faces normal stress situations that may be overwhelming temporarily, the Center offers a readily available program of counseling on a voluntary basis, to individuals, couples, and to other family members.

The counseling program is a critical Center activity. The objective of the counseling program is to provide prompt professional assistance to faculty and staff for current stress problems, many of which are in early stages and amenable to brief interventions. For those clients whose problems require extensive clinical treatment, referral to appropriate clinical resources is arranged. At the Center approximately one client out of eight requires referral for long-term treatment elsewhere.

In addition to individual counseling we offer experience in peer support groups for those members of the work community who do not have available to them active family support networks. Single parents, older persons living alone, and wives of medical residents are examples of groups which often do not have available family support in times of stress.

Our counseling activities are confidential; records are kept only for statistical reporting. We depend heavily on self-referrals; all of our clients arrange their own appointments.

Managers, supervisors and staff members can also receive individual consultation for problems with colleagues, supervisors and coworkers, provided individual identities are not revealed to Center staff, and the concerns are not more properly the business of Employee Relations—e.g., grievances, individual job evaluations.

COMMUNITY ACTIVITY

The Center is responsible to the university community which it serves through 1) an Advisory Board representing every segment of the community, including minorities, labor unions, faculty, and staff; and 2) an evaluation system which encourages all of our clients to rate the service and to suggest new activities that are appropriate for us to consider—e.g., subjects for workshops, new peer support groups, etc.

In addition to the services that we offer, the Center has been instrumental 1) in working with other Stanford groups to establish new services for University personnel—e.g., the Health Improvement Classes offered by the Heart Disease Prevention Program and 2) in coordinating jointly the efforts of diverse groups on campus concerned with alcohol and drug abuse, including Student Health, Alcohol Clinic and Help Center. We anticipate that the coordination of other university and community programs will continue as an important function of the Center.

STATISTICS

Since its inception in 1977, 2,939 faculty and staff members and 452 family members have utilized Help Center services for a total of 3,400 users.

The utilization of services by faculty and staff has increased from 137 in 1977 to 1,419 this past year (this latter figure includes participants in workshops). The counseling services has grown from 137 in 1977 to 729 clients in 1982. Faculty use of counseling increased tenfold (from 7 to 70); minority use increased fivefold (from 24 to 124); family members increased sevenfold (from 22 to 163).

Our educational program was initiated in 1978 with three workshops which were attended by 60 persons. In 1982 our workshops expanded to 27 in number and were attended by 690 faculty and staff.

In the past year the Help Center sponsored three support groups: for single parents, for mid-life women, and for learning techniques of stress reduction.

THE NEXT FIVE YEARS

What new developments in Center Activity can be anticipated for the future?

The basic mission of the Center is to enhance the health and productivity of the Stanford work force; this objective has been met thus far through a program of education and counseling that has been outlined above. But active consideration is now being given to several additional methods of improving individual productivity.

RESEARCH AND TRAINING

While the Center has relied on an informal method of evaluating Center activities (through a client evaluation questionnaire), a more sophisticated analysis of our activities is needed to properly evaluate all aspects of Center services.

What are the cost benefits in providing faculty and staff with Center services? What objective ways are there to evaluate program effectiveness beyond client ratings? What new trends are emerging in client needs that require changes in the program? These and other questions bearing on program evaluation strongly suggest the need for instituting a research component.

The Center provides an opportunity for studying health problems on individual family and community levels. It is a potential research and training laboratory for selected graduate students who, in return for access to Center data and clients, could meet the Center's need for program evaluation. A number of academic departments have expressed interest in both research and training opportunities that the Center might provide.

A committee of the Advisory Board is currently reviewing the feasibility of limited Center research and training activities, it being clearly understood that such activities must be conducted in ways that do not reduce service activities or obligations and do not impair the confidential relationship with clients or the confidence clients have in Center services.

ON-THE-JOB PROBLEMS

The Center program was begun five years ago with a clear focus on client problems that were external to the work place and the job situation. The emphasis was on personal and family problems that were impeding work productivity and health.

The bulk of our activity to date has centered on "outside" personal difficulties. However, there have been a growing number of requests from individuals and from established campus groups for the Center to address interpersonal problems that either stem from the workplace or are played in that context including conflicts between colleagues, coworkers, supervisors and supervisees.

It is clear from the history of industrial health programs that whether the initial program focus is on internal or external personnel problems, the program must be concerned eventually with both kinds of problems to realize its full potential. But it is equally clear that before the Center diverts its resources to job-related problems, a good deal of thought and dialogue is needed to avoid jurisdictional and territorial disputes.

There are several groups already involved in the area of work problems—e.g. Employee Relations, Ombudsmen, Unions. Why should the Help Center also get involved when there are others available?

Apparently, despite the existence of the offices described above, the sheer number of work problems and the preference of individuals for one consultation group or another may justify Center involvement. However, it is important before venturing into new responsibilities to be sure of protecting the enviable reputation the Center has earned for impartiality, and competent assistance to members of all segments of the university community.

The next five years should see the Center expand its program into several new areas, some of which can be anticipated. The full potential of the Center to enhance the productivity and health of faculty and staff members has yet to be reached.

Ellie Oppenheim

Oppenheim boosts student role at TMU

Ellie Oppenheim came to Stanford in September 1977 as assistant director of Tresidder Union under Dan Williams. She was appointed director in March 1980 after Williams left Stanford to return to Oregon. In the two years since she took over, Tresidder has seen a number of changes, some labor disputes, and a survey to find out what Union users really want. News Service intern Amy Bernhard recently talked to Oppenheim about what she wants for Tresidder; the story is below.

For the 20th anniversary of Tresidder Union, students published a commemorative brochure.

That's not unusual; students now participate in nearly every facet of Union operations, from staffing and managing food service enterprises to organizing on-campus programs and events.

What is unusual is that five years ago, fewer than half the number of students who currently work at the Union were employed there.

The reason for the change is Director Ellie Oppenheim, who has energetically pursued a policy of student involvement in the Union. Unabashedly proud of increasing student use and participation, Oppenheim is quick to mention that there's still a lot to be done.

Says she: "I won't say that we're perfect, because I don't think that we are; but no organization is. I'm probably my harshest critic."

She may be her harshest critic, but Ellie Oppenheim is Tresidder Union's biggest advocate.

Since coming to Stanford in 1977, one of Oppenheim's first priorities has been making the Union a place that is more responsive to the needs and desires of the Stanford community.

"We have been building and developing in ways that are making us more responsible to Stanford University faculty, staff and students," says Oppenheim. "Our goal is to promote interaction. That's the image I'd like to foster, of Tresidder Union as a central gathering place."

Offering what Oppenheim calls "high quality, affordable services" like the Crossroads food service, the Sequoia Travel Center, and the hairstyling salon provides one vehicle to draw people together.

Another is Tresidder Union programming. The Union has an obligation to provide social, recreational, cultural and educational programs for the community, says Oppenheim. Activities like the recent Harvest Festival, ballroom dancing, and wine tasting, among many others, expose students "to new ideas, concepts and skills in an atmosphere in which they can relax and have fun."

Student involvement is a primary reason why Oppenheim wanted to pursue college union management.

While an undergraduate psychology major at the University of Wisconsin, Oppenheim began planning ski club trips as a natural extension of a lifelong hobby. First planning shorter trips, then organizing a more ambitious 10-day European tour, Oppenheim was hooked on planning student activities.

She advanced from the ski club to the Union Program Board, planning and producing art exhibits, entertainment, and lectures, as well as making recommendations to the University Chancellor about Union policies.

Realizing that she enjoyed this volunteer work, Oppenheim stayed at Wisconsin to pursue her M.B.A. to "gain both skills and credentials to go on as a director of a University student union."

After spending three years there as assistant manager of the student union, she came to Stanford, where she has since been using her management skills, experience and enthusiasm to improve Tresidder.

Under her direction, students now help interview prospective employees and screen resumes—an opportunity for first-hand experience in job interviewing and resume-writing.

Oppenheim has also encouraged student involvement in entrepreneurial ventures. The Corner Pocket, the Patio Grill and Encina Station are all food services run by students. Tresidder staff give support and advice, but management is the students' responsibility.

Says Oppenheim proudly, "I don't know of any other union running that kind of entrepreneurial agreement."

Planning to continue most of the work started when she first arrived, maintenance and repair of current facilities rate high on her list of priorities. Cleanliness and appearance are weak points in the Union—largely, she says, because of budget deficits in the 1970s.

Another problem Oppenheim would like to correct is a lack of space. Currently, many services provided are so popular that they are almost *too* successful for the space they have. For example, the Store is the most heavily used Tresidder facility, yet as any lunchtime shopper knows, it is often cramped and overcrowded. The Coffee House faces a similar problem, in that it is not designed for the volume the Coffee House management would like to handle.

However, Oppenheim doesn't have any immediate plans for expansion. Her first goal is to identify the separate users of the Union, and their respective needs.

"We're starting simply by learning who our users are. We would like to serve all segments of Stanford. We're reaching our limitations of space, but we're not anywhere near reaching our limitations of needs."

Life insurance deductions set

Jeannie Thomas, manager of Benefits and Records, wants to thank all faculty and staff for their positive response to the new life insurance plan. The Office of Benefits and Records is currently processing all the forms received over the past 60 days.

The life insurance deduction for those who chose Option II should appear on the Nov. 22 paycheck. If no deduction appears, or if the deduction seems to be incorrect, please contact the Life Insurance Center at 7-0757 immediately. Those faculty and staff who chose the $5,000 free coverage (Option I) will not have a deduction.

Life insurance certificates will be distributed after December to all faculty and staff who enrolled in the new plan. Attached to these certificates will be a copy of the completed enrollment form.

Audio-visual guide available

Stanford faculty and staff may have an easier time locating the audio-visual equipment they need for their classes if they use the new *Guide to Audio-Visual and Instructional Resources at Stanford*.

The free pamphlet lists the location of the audio-visual equipment on campus, including computer equipment, film and videotape facilities, and graphic art and photography services.

The guide is a joint project of the Center for Teaching and Learning, the Stanford Instructional Television Network, University Events and Services, and the Communication Skills Program of the Graduate School of Business.

The guide is being mailed to Stanford faculty members. Others who would like a copy can call the Center for Teaching and Learning at 497-1326.

This little girl, forced to evacuate her home during the heavy rains last January, was one of more than 10,000 Bay Area residents who received emergency shelter, food, or clothing from the local chapters of the American Red Cross. The Red Cross is one of the agencies supported by the United Way campaign, just starting on the campus. All faculty and staff will soon receive an appeal from this year's United Way chairperson, Lois Fariello—please remember how many local programs depend on it. *(Photo reprinted with permission from the Peninsula Times Tribune.)*

Soviet studies in U.S. have eroded sharply in past two decades

The death of Brezhnev with its attendant speculation has dramatized the extent to which Americans are not ready to answer serious questions about the Soviet Union, according to two Stanford Soviet experts.

A lack of support in the last 15 years by the government and private foundations for research in Soviet policy has been accompanied by a serious erosion of programs of Soviet studies within universities nationwide.

"Since the late 1960s many aspects of Soviet and East European studies have been deteriorating and are approaching a state of crisis," says history Prof. Alexander Dallin, chairman of the international relations program.

"There has been a major decline in support on the part of the foundations (notably Ford, Rockefeller, and Carnegie) which had previously contributed generously to the development of the field, and in some instances also on the part of the private universities and state legislatures supporting public universities."

As a consequence, adds Dallin, we probably now have fewer experts in the field than at any time since 1945. Further, of the top specialists in this field, more than one half will retire within the next five to ten years and there will not be highly experienced people to replace them.

Dorothy Atkinson Alexander

Alexander Dallin

The most exact indicator of the decline in Soviet studies is the decrease in language enrollments in Russian and East European languages, says Dorothy Atkinson, executive director of the American Association for the Advancement of Slavic Studies, currently based at Stanford.

Enrollments in Russian peaked in 1968 and have steadily declined since that time. By the fall of 1980 Russian enrollments in over 2,000 institutions of higher learning surveyed by the Modern Language Association had dropped 40 percent as compared to 1968. Enrollments in secondary schools declined by over 70 percent in the same period, according to Atkinson.

The report of the Presidential Commission on Foreign Language and International Studies in 1979 stated that the situation was critical. "Since that time, over 50 institutions of higher education in the U.S. have completely shut down their Russian programs of instruction in the Russian language," says Atkinson.

She notes that there are currently more teachers of English in the Soviet Union than students of Russian in the U.S.

A bill is currently before Congress, which attempts in part to remedy the situation. Introduced by Senators Richard Lugar (R-Ind.) and Joseph Biden (D-Del.), the bill asks for a government endowment to aid certain institutions in need of support of their programs in Russian and Soviet studies.

If approved, the bill would allocate $50 million to be invested in government bonds, the interest from which would be dedicated to enhancing programs at centers such as the Kennan Institute for Advanced Russian Studies.

The recent Harriman grant to the Soviet Studies program at Columbia University may also indicate a turnaround in private support, says Atkinson.

Both scholars admit, however, that serious damage has already taken place, which will take years to remedy. As an example of our current unpreparedness in this field, Dallin noted that two years ago a Soviet soldier defected from the Russian troops in Kabul and sought asylum in the American embassy. "There was no one there who could talk to him," because no one knew Russian. —**Millicent Dillon**

How four scholars at Stanford view Brezhnev succession

Prof. Robert Wesson, a senior research fellow for five years at Stanford's Hoover Institution, who is affiliated with the University of California (Santa Barbara), said:

"Few people realize that whoever becomes president of the Soviet Union will need quite a few years to consolidate his power. It took Stalin four years to get real control, it took Khruschev two years, and Brezhnev shared power with Kosygin and Podgorny for a long time before he was able to emerge as the man in control.

"To get control the leader has to remove from office, or shunt aside, all those who are not recognizably his own men.

"For the next few years, therefore, we shall be dealing with a new president who is not the absolute leader, but first among equals.

"The armed forces of the U.S.S.R. may very well have a stronger influence on the selection than they have in the past. There are indications that the military is fed up with what it regards as the inability of Russia to become dominant in arms.

"The generals are also dissatisfied with the quality of life in Russia and the state of morale. They don't like the fact that since 1977 the death rate has been going up in the Soviets, that alcoholism is becoming a severe problem. The food lines are back in Russia for the first time since the Stalin regime.

"The general belief that Andropov will win the struggle is probably accurate, and the fact that he is head of the funeral commission is another strong clue to that.

"Russia is rather like America politically in one respect. If a candidate is in the lead, as Andropov is, he has to run a little faster. He is more vulnerable, he has nowhere to go but down, he is more exposed to criticism. I am not predicting that Andropov will win, but the indications on balance do seem to favor him.

"The fact that Andropov has been head of the KGB could mean that he would be able to consolidate his power more quickly."

Mikhail Bernstam, a Russian dissident who is a visiting scholar at Hoover Institution, and has been in this country for five years since his Russian citizenship was revoked for his 'anti-Soviet' activities inside the U.S.S.R., described what is going on in the Kremlin as a result of Brezhnev's death.

"The authorities waited for 26 hours before announcing the death because three important steps had to be taken first. Number one was to alert the military in every area of the country. This was not for purposes of national defense, but for internal security. There is often a tendency when important events occur in Russia for the people to seize the excuse for indulgence both in alcohol and food.

"It is highly probable that the second step taken was to limit distribution of alcohol.

"The third step was probably to increase food supplies, so as to lower the likelihood of outbreaks of protest at the long-continued shortages. It is a rare occasion when the mass of the people can have a ready excuse to demonstrate, even grief for a leader, and the authorities want to keep everything calm.

Thursday is the day of the weekly meeting of the Politburo, the 15-man controlling body of the U.S.S.R., and undoubtedly they are making arrangements for the regular meeting of the plenum committee of the Communist Party, which takes place in two weeks time. It is this joint legislative assembly that will vote on the new leadership.

"Between now and then the various major groups inside Russia will be lobbying and maneuvering to try to ensure that the choice will be a person amenable to their particular interests. Among these groups the important ones include the military, the secret police, the heavy industry delegates, and perhaps most important of all, the entrenched bureaucracy."

Robert Conquest, senior research fellow at Stanford's Hoover Institution, and curator of its East European collection, recently attended a meeting of leading experts on Soviet affairs.

"Our consensus at that time was that the most likely person to become president was Konstantin Chernenko. However I am hedging my bets somewhat now, in view of Brezhnev's death, and the fact that his influence will not be there at the Communist Party meeting which votes for the leader. I think it will be Andropov by a narrow margin, but Chernenko is by no means out of the running.

"I'm sure that Brezhnev's death came at an awkward time for the Politburo. When you think that three out of the five top men in Russia have died or retired since January it is clear that the Politburo has been caught on one foot.

"I am often asked if one of the younger men may not get the job. The fact is that the youngest likely person is Gorbachev who is 51, and has held for the last 20 years posts that give him little support from the factions that count in the voting. The other is Romanov, who is 59, (and) may still be in disfavor because of the party which he gave for his daughter a year or so ago, when priceless crockery of historic value was smashed during the festivities.

"It will not be last-minute lobbying that will occur from now till the full selecting committee in two weeks time. The struggle for influence and votes has undoubtedly been going on for a long time. Perhaps it has gone on for years. Most of them are probably trying to figure out who is going to win and if and when to switch their support and perhaps rat on the other person they had promised to support. They lobby each other and waste a great deal of time in four-hour speeches to the Politburo in which they try to establish influence.

"Among my reasons for picking Andropov is that he is undoubtedly the one who has been most closely identified with the Party line, whereas those who were still in what might be called the Brezhnev camp at least talked about reform.

"At the meeting which I attended recently of experts on Russia there was general agreement that the struggle and internal dissension in the Politburo will probably go on for a couple of years.

"The scene inside the Kremlin will continue to be what it has been for years, that of something akin to Machiaevelli's *Prince.*"

Stanford History **Prof. Terence Emmons,** who has for 41 years edited the *Russian Review*, the oldest journal of Russian affairs in the nation, said:

"Yuri Andropov, who until recently was head of the KGB (the secret police) and then retired, has been widely supposed to be a leading candidate for the top position. However, others, such as the novelist Zinoviev, think it may prove to be an unknown such as Grischin.

"External evidence seems to point to the fact that a power struggle has been going on for a long time between the factions who want their point of view to rest with the man at the top. This was shown fairly clearly in 1978, when a leading member of the Politburo died and the authorities went to extraordinary lengths to publicize the medical report on the causes of his death. It gave long details of the cirrhosis of the liver, the cancer and heart condition which were all said to have led to the death. Clearly the authorities were worried about public reaction to the death and the need to allay suspicions that the dead man was a victim of the power struggle.

"Brezhnev has been seriously-ill for at least four years, so there is little doubt that the power struggle has been going on for at least that time. After Stalin died the power struggle led to the deaths of several high-ranking people."

Asked whether the Soviet armed forces were a dominant factor in the selection of the new leader, as evidenced by the huge arms budget in the U.S.S.R., Emmons replied that he thought the U.S.S.R. was unique among totalitarian societies in not being politically maneuvered by the armed forces.

New Baroque organ for Memorial Church a labor of love

For Herbert Nanney, professor of music at Stanford, it is a joyous event more than 30 years in the making.

For Charles Fisk, who once planned to be a nuclear physicist and instead became a student of Nanney's, it is an opportunity to give something unique to the sources of his inspiration.

And for thousands of students, faculty, staff and local residents who gather and worship in Stanford's Memorial Church, it will be a chance to enjoy an even broader, more beautiful and more authentic program of music.

All are anxiously awaiting the arrival, a year from now, of a new Baroque-style organ—a type of Baroque organ never before built. Charles Fisk, a former Stanford organ student, is the organ's designer and builder.

Nanney, a master organist who has taught music at Stanford since 1947, says talk began in the 1950s about the need for a new organ in the church to expand the range of music which might be played. Because the church is non-denominational, the best of church music from all periods and faiths has always been performed there.

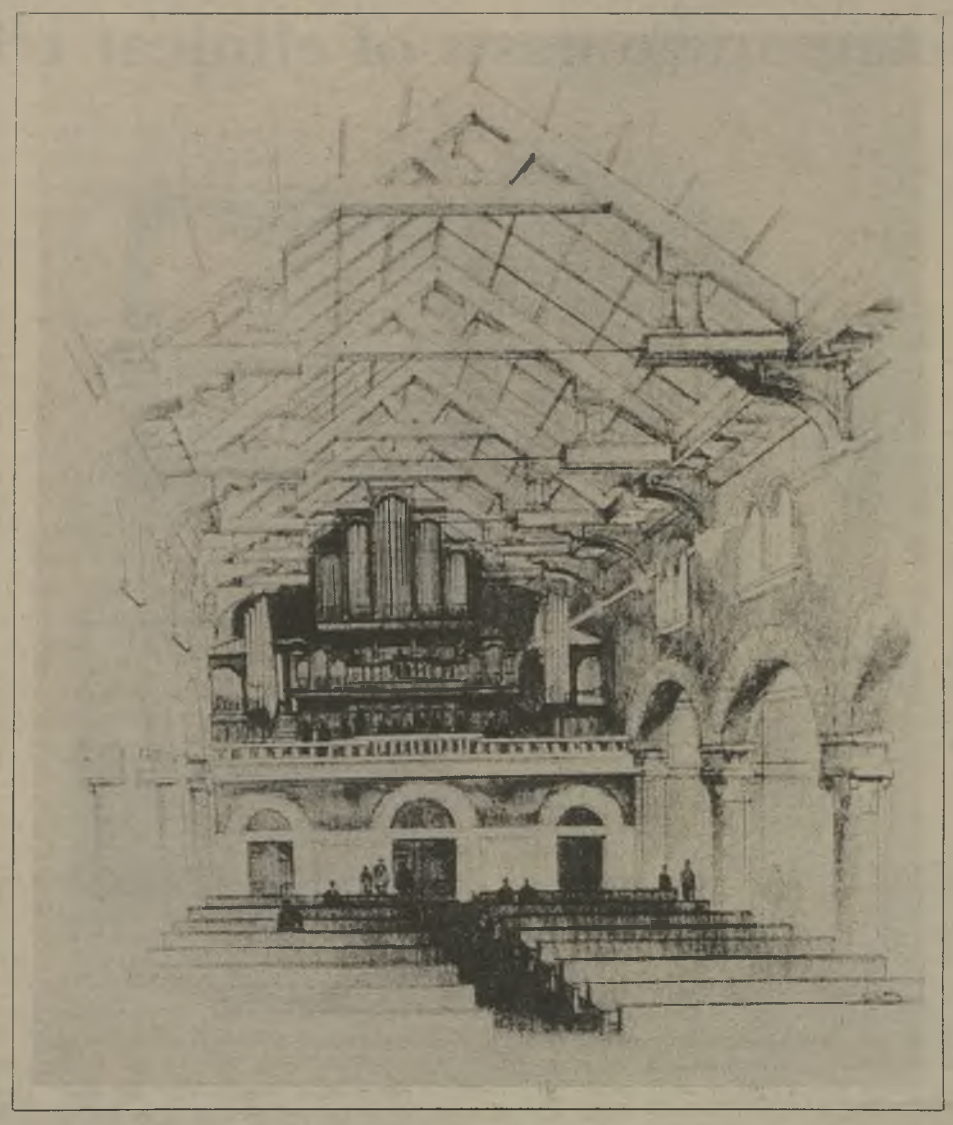
Sunday services featuring the Memorial Church Choir, 75 strong, have long been accompanied by Nanney on the romantic organ built by Murray H. Harris in 1901. However, its sound is just not suitable for some of the music which Nanney would like to see performed, particularly music from the French and German Baroque.

Fortunately for both Nanney and the community, Evelyn Almack Turrentine, loyal worshipper, joined Nanney's dreams to expand the musical range of the church.

"She was our next-door neighbor on Alvarado Row, and she used to say, 'Some day I'm going to leave some money in my will for a new organ,' " Nanney recalls.

"Of course, then she married Lowell Turrentine and moved to another home and I had forgotten about it. Then, in 1973, I was on sabbatical in England and I learned that she had died and left $400,000—half her estate—to fund the new organ. I had had no idea she would leave that much money. I was very excited."

Nanney soon learned that far more money would be needed because of the necessity of strengthening, against possible earthquake damage, the church's north wall, where the new organ would join the old one.



Fortunately for Nanney and the community, Virginia Morell, widow of George Morell, provided in 1979 that proceeds from a sale of property be used for renovation of the church, thus financing an additional $510,000 of the project's $1.9 million cost.

In September, the Board of Trustees upped the budget to $1.9 million from $1.6 million, in order to expand the capabilities of the new organ, making possible performance of both Baroque and Renaissance music. To accomplish this, the organ will have 17 keys per octave instead of the usual 12.

Family-like dedication

Much of the project's charm comes from the almost family-like dedication it has inspired among those involved.

Nowhere is this more apparent than with Fisk. His 20-member workshop in Gloucester, Mass., is currently hard at work on the organ—casting the tin and alloyed metals which make up the pipes, joining and molding the fine wood which forms the organ's chests and casework, and preparing for the extensive tonal testing which will be conducted before it is shipped to Stanford.

Drawing shows what the new organ will look like

After Fisk earned his A.B. at Harvard, he came to Stanford in 1950 to begin work on a Ph.D. in nuclear physics. But one day he walked into Memorial Church, heard Nanney playing the organ, and his entire world began to change.

"I realized I was deceiving myself," he says. "I didn't want to be a nuclear physicist. I wanted to do something in music."

Fisk's musical background, up to then, consisted of singing in a boys' choir under organist E. Power Biggs, singing in Harvard's Memorial Church choir, and playing a little piano and trumpet.

Robert Keine, Nanney's assistant, suggested that Fisk meet with John Swinford, who took care of the Stanford Memorial Church organ. Swinford assured Fisk that one way to be a musician was to be an instrument maker. "There's no money in it, but great satisfaction," Swinford said.

Fisk immediately changed his major to music and stayed at Stanford for six quarters, taking all the music courses an undergraduate major would take.

"Herb Nanney despaired of my ever learning to play the organ," says Fisk, "but one thing I did learn was that American organs were totally unsuited to playing the music of J. S. Bach. I wondered if there was some way to make an organ so that Bach and other early music would sound truly authentic."

Fisk became part of a growing group of people at Stanford interested in early music, among them Nanney, Putnam Aldrich and George Houle.

Fisk didn't stay around long enough to earn a degree. But now, says Nanney, he "is considered by most organists to be the top American builder of the Baroque type of organ."

Trend toward authenticity

"There is a trend today," Nanney continues, "toward using the correct instruments for the pieces for which they were originally written. (With the Murray Harris organ) we can simulate to some extent a Baroque piece, but it just doesn't sound the same. It's like playing harpsichord music on the piano."

The church's present 3,355-pipe romantic organ survived the 1906 earthquake virtually unscathed, even though the wall behind it did not. The recent reconstruction of the north wall is the first since 1912 when the quake damage was repaired.

These renovations included concealing steel frames behind the wall and behind the arch columns facing the quadrangle. The stonework on the wall's face was replaced with concrete designed to replicate the former appearance.

After the Fisk organ arrives in mid-1983, it will be "voiced"—a three- to four-month process during which the instrument will be acoustically adapted to its new surroundings.

"They'll adjust the pipes so that they fit the room with the right brightness, right blend and right volume," according to Nanney.

Representatives from the Fisk Company visited Memorial Church and took extensive measurements in order to design and build the new organ with both acoustic and aesthetic considerations in mind.

Acoustical improvements

Unfortunately, the ornate nature of the church's interior made it impossible for the new Fisk organ to be installed without some concessions; one of the beautiful stained-glass windows is now obstructed from the congregation's view from the inside of the church. However, plans have been made for lights to be installed to make the window still visible from outside.

In addition to structural changes, alterations to improve the church's acoustics were made, and burlap cloth, plus two inches of felt which had been placed on the ceiling of the church many years ago was removed.

When Fisk finishes his job, he notes, he will have built new organs "in the two universities where I've studied." He provided a new organ for Harvard's Memorial Church, and now it's Stanford's turn.

"I wanted to build an organ that not only will serve as the Memorial Church organ at Stanford, but one that would bring full circle the process that began there for me, a quest for a truly old organ. I wanted old music to spring to life in the way it was written, in a way it hadn't been heard before.

"This all seems to be a working out of my destiny, to bring me back to Stanford."

—Joan O'Connell

Ph.D. oral exams

FRIDAY, NOVEMBER 19

David I. Brubaker, electrical engineering, "Theory of Acoustic Speckle," 2:30 p.m., AEL 109. **Frederic B. Jennings**, economics, "Interdependence, Incentives, and Institutional Bias: An Organizational Perspective on the British Canals," 2:15 p.m., Room 414, Encina Hall.

MONDAY, NOVEMBER 22

Max Henrique Machado Costa, electrical engineering, "Interference Channels," 3:15 p.m., Durand Bldg., Room 260. **Jennifer Freyd**, psychology, "The Internalization of Physical Laws of Motion," 2:15 p.m., 358 Jordan Hall. **Kenneth Olson**, philosophy, 1 p.m., 91B.

WEDNESDAY, NOVEMBER 24

Jonathan Bregstone Green, applied physics, 2:15 p.m., Applied Physics 200. **Helen Fay Nissenbaum**, philosophy, "Emotion and Focus," 1:15 p.m., 91B.

Medical Center MEMO

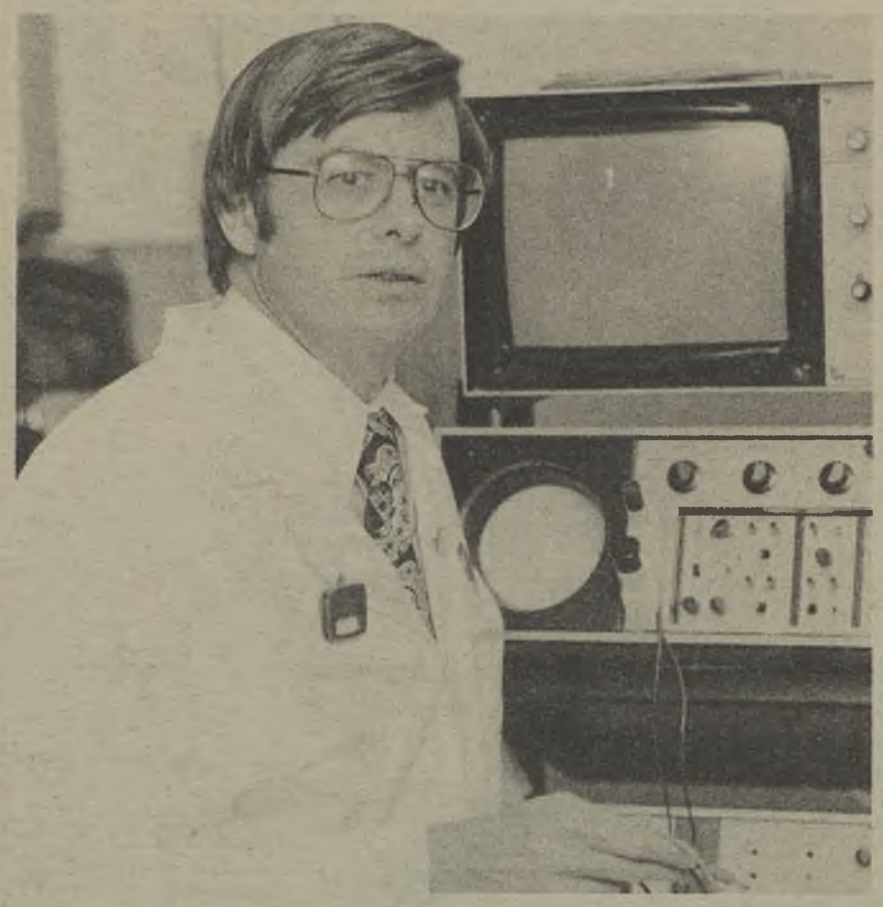
Computers to bring down costs of clinical trials

Because of advanced technologies, such as computerized image processing, doctors can now study heart disease in new types of less costly clinical trials, according to the president of the American Heart Association.

"Such studies could utilize a few hundreds of volunteers instead of the many thousands demanded by most of today's large scale clinical trials," said Dr. Donald Harrison, Irwin Professor of Medicine and chief of the division of cardiology at the Stanford University School of Medicine.

"The duration of such studies would only be a few years, the costs would be acceptable and therapeutic interventions would be rigorous," he said.

The new type of clinical trial would evolve a new strategy to study the factors which result in progression and hopefully regression of atherosclerosis, or hardening of the arteries, Harrison said. Physicians would visualize the development of atherosclerosis by computer-based techniques, so that treatment may begin at earlier stages of the disease.



"Such techniques have been already developed for studies of femoral and coronary arteries," he said.

Harrison addressed the annual meeting of the American Heart Association in Dallas, Texas, Monday, Nov. 15.

Clinical trials that compare prospectively the effects and value of a given treatment against a control in human patients have long been regarded as the cornerstone of modern clinical medicine.

They include the so-called "therapeutic trial" in which doctors document statistically one treatment as being superior to another, and the "intervention trial" which determines the probable effect of a treatment on the biological processes of man.

Clinical studies have been utilized with an increasing scientific basis and sophistication, and more of them have been performed in the past 20 years than in all of recorded medical history, Harrison said. Yet there's more controversy about them than in any previous time.

Donald Harrison, president of the American Heart Association

Harrison cited these reasons:

- Clinical trials require long-term commitments for study and are expensive.
- They compete for research dollars for basic and clinical research of many institutions.
- They fail to provide answers, and they become self-perpetuating in that one trial uncovers multiple other questions requiring more clinical trials.

"This results in massive costs," Harrison said.

He cited a recently federally-funded study on the value of trying to diminish the major risks associated with heart disease that cost $115 million. The study found no significant difference in deaths between a group that received special medical treatment and one that received more ordinary care.

"Results may be influenced by multiple uncontrollable factors, especially in field trials in free-ranging populations," Harrison said. "Control populations modify their behaviors with societal changes and thus confuse the results. This clearly occurred in the multiple risk factor study."

In addition, Harrison said, not everyone agrees with trial design. Some are timed poorly after the questions they seek have already been answered by ordinary clinical practice. And there are moral and ethical limits to clinical trials.

"These controversies," Harrison said, "suggest that we need to examine ways to improve clinical trials in the future."

Harrison described an example of a model computer analysis system that he developed with his colleagues, Dr. Edwin Alderman and William Sanders, for studying coronary arteries.

The system provides direct visualization of the extent of atherosclerosis in arteries so that treatments may be applied at earlier stages of the disease.

The computer is programmed to provide volumes, diameters, areas and degree of narrowing of multiple segments of the vessel. These variability limits are used to set boundaries and quantify vessel changes in atherosclerosis.

"The value of this technology is that it provides a continuous variable measure, from small lesions to large ones," Harrison said. "Every participant in the study contributes a value rather than a small percent of patients having death or infarction (heart attack) as occurs in regular clinical trials."

Numerous technologies now available will permit new horizons for clinical trials in the next two decades, he predicted, and "we should use them."

—Spyros Andreopoulos

Asia-America exchange in the works

A program promoting the exchange of medical education and research between Asia and America has been established by Stanford University School of Medicine's department of medicine, according to Dr. Thomas Raffin, assistant chief of the department.

Stanford University-Asia Medical Fund (SAMFUND) will sponsor the exchange of research fellows, and eventually faculty and educational and research programs between universities in Asia and Stanford, he said. The first group of up to four fellows is expected to arrive at Stanford for the 1983-84 school year for up to a three-year stay.

"The purpose of this funding is to improve health care and increase communication and understanding," Raffin said. "By bringing together people from the Pacific Basin and America to compare and exchange ideas, a framework will be established for learning, understanding, and growth."

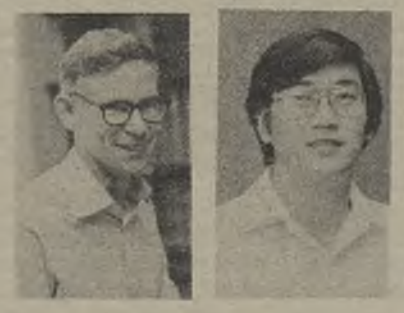
Specifically, Raffin said, the fellows will "work in some of Stanford's top investigative laboratories. They can then take their newfound knowledge and expertise back to their own universities and continue developing their own careers."

In turn, he continued, "there is exciting opportunity for Stanford fellows and faculty to spend time at Asian universities investigating specific diseases—bilary tract disease, hepatitis-B, and certain cancers indigenous to those areas.

"Stanford researchers have a unique opportunity to collaborate with some sophisticated programs of investigative groups at these universities," Raffin said.

From idea to reality

The program was spearheaded by Raffin, who first traveled to Japan and Hong Kong in 1978 to explore the possibilities of setting up such an arrangement. In 1981, the Ishiyama Foundation of San Francisco contributed $500,000 to the Department of Medicine to establish SAMFUND.



The same year, Dr. Anthony Felsovanyi, clinical professor of medicine, traveled to Hong Kong with Raffin to establish an advisory board of civic and corporate leaders, who contributed another $500,000 to SAMFUND.

The organization's board of directors was formed in 1982. In addition to Raffin and Felsovanyi, the board includes Drs. Kenneth Melmon, chairman of the Department of Medicine and of the board; Richard Popp, vice-chairman of the Deparment of Medicine; and Ferid Murad, chief of medicine at the Palo Alto Veteran's Administration Medical Center.

The advisory board in Hong Kong is responsible for helping to support the Hong Kong-Stanford program. Similar boards will be established in other Pacific Basin areas including Japan and possibly mainland China.

Raffin said he hopes SAMFUND will attract sufficient funding to support these academic exchanges. Said Melmon of the program, "This is an important academic program with great potential for strengthening medical investigation in Asia and at Stanford."

—Shirley Kraus

Robert Baldwin Peter Kim

Professor & student will SMASH Friday

This Friday's S*M*A*S*H lecture will be delivered by Dr. Robert Baldwin, professor of biochemistry, and Peter Kim, a fourth-year student in the Medical Scientist Training Program.

They will discuss "Experimental tests of the Prediction of Protein Folding," 4:30 p.m. Nov. 19 in the Fairchild Auditorium, with a TGIF gathering afterwards in the lobby.

Herpes simplex. . .

Trimming fiction from facts

Despite a "herpes hysteria" arising from increasing media coverage of the sexually transmitted virus, the disease is probably not as infectious as most people believe, said Dr. John Mills, a visiting scholar in infectious diseases from the University of California, San Francisco.

Mills spoke Tuesday night, Nov. 9, in an overview lecture on the clinical problems with herpes simplex viruses in adults, the first of a three-part series of public talks on the viruses.

"Herpes, both in the perception of the physician and the lay public is, at the present time, a fairly serious problem," Mills said. "What is not clear is whether there has been a real increase in the incidence of this disease in recent years."

Though Mills cited one study that showed a nearly ten-fold increase in the reporting of herpes simplex outbreaks between the years 1966 and 1980, he said the jump could be simply a result of the public's increasing awareness of the disease and willingness to report symptoms to physicians.

The two herpes simplex viruses that afflict at least 15 million Americans with recurrent cold sores and genital infections stem from a family of viruses that include those causing chicken pox, shingles, and mononucleosis.

Currently there is no cure for herpes simplex infection. Though outbreaks of the open sores symptomatic of the infection usually last less than a week or two, and may occur only once or as often as several times a year, the virus remains in the body as long as the person lives, and can become active at any time without warning.

Nearly 90 percent of all Americans have antibodies to herpes simplex virus I (HSV-I), indicating that sometime during their lives they were exposed to the infection, according to a recent study. Usually associated with milder, less frequent outbreaks of blisters than HSV-II, HSV-I most often causes sores in and around the mouth (though genital infections are possible), and can be contracted simply through contact with an infected person's saliva, Mills said.

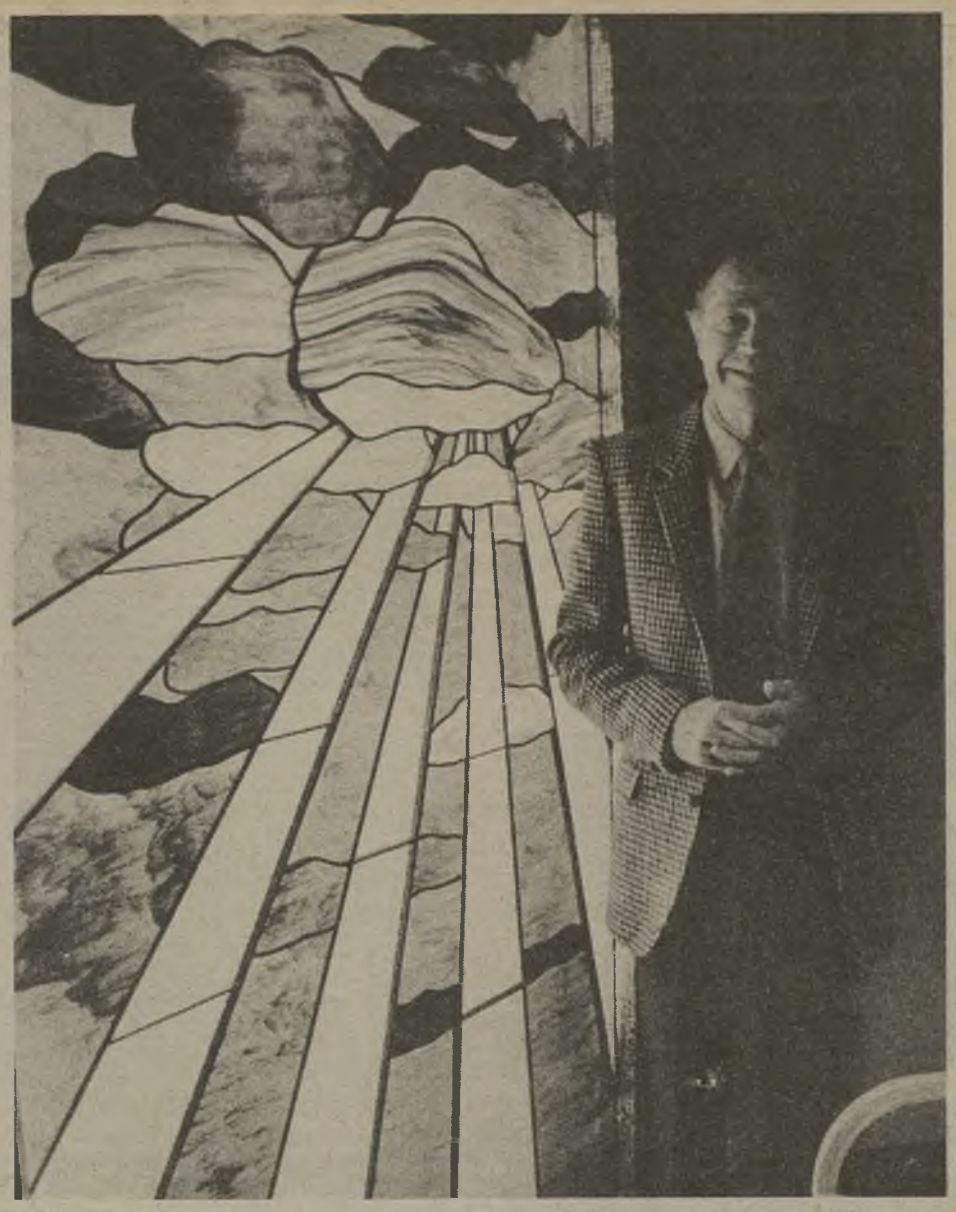
HSV-II, the virus most often associated with genital inflammation, occurs less frequently—in between one and ten percent of all Americans—the same study showed. Current commercially available blood tests don't distinguish between HSV-I and HSV-II, so patients may learn they have contracted herpes, but not know which variety they have.

Immunologic tests and probes using monoclonal antibodies can accurately identify each virus strain, and should be ready to move from the laboratory to the physician's office within three or four years, said Mills, who is chief of infectious diseases at San Francisco General Hospital.

Despite its reputation, HSV-II "is not terribly infectious," Mills told the crowd. "Everybody worries a bit about getting the infection from a toilet seat or towel, but it takes sexual contact or the equivalent for transmission of the virus."

Because herpes has a thin protein coat that dries out easily, the virus can't survive more than 24 hours outside the body and has a tough time infecting healthy, unbroken skin. "Skin-to-skin or mucous-to-mucous contact is required for infection," Mills said.

People with herpes frequently ask whether they can inadvertently transmit the infection to a sexual partner during the disease's dormant periods. The answer is a qualified no, according to Mills. "You probably don't get herpes from people who are completely asymptomatic," the scientist said, "but because symptoms can be mild most individuals don't realize they have the disease."



"Barrier" birth control methods such as condoms, and "open, empathetic communication between sexual partners" can help minimize the risk of infection, Mills said.

Dentists, anesthesiologists, and other health professionals who work in patients' mouths should wear rubber gloves, he said, to avoid contracting the oral form of the virus.

While herpes is bothersome but not life-threatening for the great majority of adult sufferers, the infection can be fatal in newborns. Dr. Anne Yeager, associate professor of pediatrics at Stanford, described the risks for fetuses and infants in contact with infected adults in the second lecture of the series last night, Nov. 16.

Dr. Thomas Merigan, professor of medicine in infectious disease, will profile current and future treatments for the disease in the final lecture Nov. 23. The presentation will be held at 7:30 p.m. in the Medical School's Sherman Fairchild Auditorium.

—Deborah Franklin

Chaplain Ernle Young takes pride in the new chapel's large stained glass window.

Hospital's new chapel opens today after year of being missed by all

The dedication ceremony for Stanford University Hospital's new chapel is scheduled for 4 p.m. today, culminating an open house scheduled to begin at 2 p.m.

Located across from the Hospital gift shop, the new facility is being completed just about a year after the former chapel was eliminated as part of the Patient Admitting Services' renovation.

The chapel features a floor-to-ceiling stained glass window, created by artist Ginny McAfee, and funded by the Medical Center Auxiliary. The window symbolizes "hope in the midst of pain and despair," said Dr. Ernle Young, chaplain. It contains no sectarian elements, he added, to maintain the Hospital's non-denominational policy. The window is bordered by tiles from the University's original Memorial Chapel, which was rebuilt after the 1906 earthquake.

"The chapel has really been missed," Young said. "Staff as well as families and patients need a quiet place available to them."

Young, who organized the chaplaincy at SUH 10 years ago, said he and his colleagues, Reverend Frank Geer and Father John Hester, serve those who seek them out by simply responding to their needs—ranging from finding accommodations at a local hotel or buying an airline ticket, to carrying out religious functions or just listening to people express their feelings.

"The most challenging function for me is to deal with people's existential questions about life and pain, and helping them find satisfactory answers," Young said.

About 65 percent of the patients Young deals with are critically or terminally ill and are concerned with issues such as the right to die and the quality of life. In such cases, Young said he tries to present all options to families and patients, and help them decide what may be the best for all involved.

Young said he encourages local clergy to continue caring for members of their congregations in the Hospital. "Our offices serve as a base for clergy. We don't want to come in between them and their members, but rather we are here to supplement their services."

The chaplains' offices are located in C112A, next door to the new chapel, and they can be reached at 497-5101. The chaplains are there during regular business hours, and are always on call.

CRONA convention: holistic health

The public is invited to attend "The Nurse as Healer: Self and Others," a program planned for the 1982 CRONA (Committee for the Recognition of Nursing Achievement) Convention, to be held Nov. 22 and 23 in the Fairchild Auditorium.

Topics of the first day will center on holistic health, with continuing education credit available. Speakers Joyce Lechuga and Katharine Riordan will address such issues as "Disease, Holistic Health and Personal Responsibility," "Concept of Stress/Message and Benefits of Illness," "Mind/Body Relationship in Creating Illness and Health," "Role of Nutrition in Health Treatment for Healthy, Vital Nurses," and "Experiential Visualization in Healing."

The registration deadline is Nov. 18 for both days' programs and Monday's banquet dinner at Rick's Swiss Chalet in Palo Alto, which will include a discussion by Bonnie Berg of "Women's Health from a Holistic Perspective." Fees will be charged for that day.

Tuesday will consist of the CRONA business meeting, including a talk by President Hedy Dumpel on "CRONA's Art of Collective Bargaining," as well as discussion of bylaws, resolutions, and budget. Attendance at the business meeting is mandatory for area representatives.

For further information call the CRONA office in Palo Alto at 325-2801.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

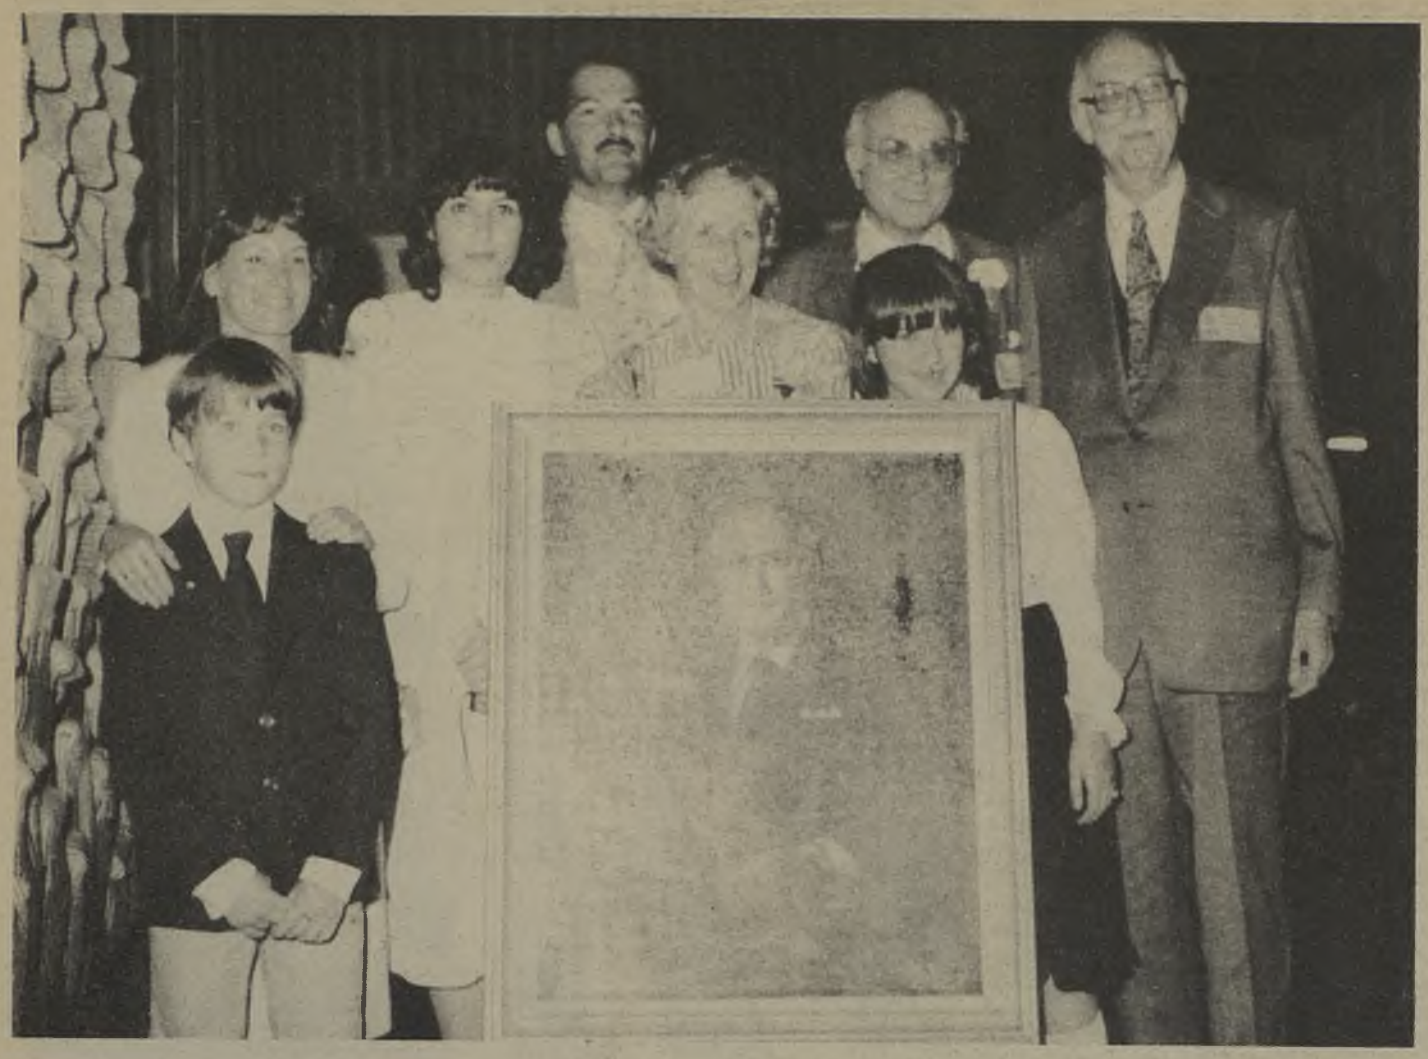


PHOTO BY LEONARD WINOGRAD, DEPARTMENT OF DERMATOLOGY

A FEAST FOR THE FABULOUS FARBERS—More than 350 colleagues, former dermatology residents, and patients gathered last Friday at the Sharon Heights Country Club to pay tribute to Dr. Eugene M. Farber (second from right), professor and chairman of the department of dermatology at Stanford for the past 35 years. They presented him with an oil painting which will hang in the Medical School's hall of fame with portraits of other leaders. Farber's work has been in skin disease, particularly psoriasis. Pictured here with him (from left) are Dr. Farber's grandson Ben, daughters Charlotte and Nancy, son Don, his wife Ruth, granddaughter Elinor, and brother Dr. Jay Farber.

Construction Corner

Item: Construction involving the expansion of offices for the Chaplaincy Service and the relocation of the chapel on the first floor of the Hospital is completed. Besides the chapel, the area will provide additional space for the Hospital chaplains as well as visiting local clergy. (*See related story on the chapel dedication, page 13.*)

The construction was done by George MacDonald Inc.; Gordon MacLachlan was the project manager for SUMC Facilities.

Item: The renovation of the Biochemistry Dishwashing area on the third floor of the Medical School is nearing completion. The 968 square foot area underwent remodeling of three rooms and installation of a new moisture barrier for the floor. The installation of new dishwashers and drying equipment will complete the project.

Norm Berge of the SUMC Facilities Office is project manager, and Michael E. Morgan Construction is the contractor.

Editor's note: *This new regular column is prepared by members of the SUMC Facilities Department.*

...News Notes...News Notes...News Notes...

The Lane Medical Library is holding a booksale Wednesday, Dec. 1, in the Sherman Fairchild Auditorium Lobby.

From 8 a.m. till 12 noon, books will sell for $2 each. From 12:30 till 4 p.m., the price will be $1. Rare books and special items will be individually priced.

Proceeds of the sale go towards new library acquisitions.

Barbara Battino

Barbara Battino has been appointed associate director of Hospital Public Relations effective Nov. 8, announced Spyros Andreopoulos, director of the Office of Communications.

Battino will be a staff member of the Office of Communications, but will report directly to Sheldon King, executive director of SUH. She will be chiefly responsible for organizing and implementing the Hospital's public relations program. Initially her activities will be directed in support of the Hospital Modernization Program.

Battino comes to Stanford from the University of Washington in Seattle, where she served in a similar position with the Health Sciences Center and Hospital. Prior to moving to Seattle in 1978, Battino had served on the public information office staff of Stanford University Medical Center.

She will be temporarily housed in the HMP Office, Room P1095, and can be reached at 497-6645.

* * * *

Dr. Robert Glaser, former vice president for medical affairs and dean of the School of Medicine (1965-70), was elected president of the American Clinical and Climatological Association at the association's annual meeting last month in Tucson, Arizona. He will serve in the post until October 1983.

Glaser has been a trustee of the Henry J. Kaiser Family Foundation since 1970, and has been its president and chief executive officer since 1972. He currently serves as consulting professor of medicine at Stanford. He is a director of the Palo Alto Medical Foundation as well as several companies..

As president of the American Clinical and Climatological Association, Glaser succeeds Dr. George Cahill, professor of medicine at Harvard Medical School.

Ronald Castellino

Dr. Ronald Castellino, professor of radiology, has been elected a member-at-large of the 12-person executive committee of the Faculty Practice Program, announced Don Tower, executive director of the FPP.

Castellino's election was announced this week following mailed balloting of the entire FPP constituency.

Castellino serves as director of the Division of Diagnostic Radiology.

The executive committee schedules weekly meetings to direct the FPP, the organized medical group practice of the faculty in the clinical departments of the Medical School.

Dr. Iris Litt, director of adolescent medicine and associate professor of pediatrics, received the 1982 Adolescent Health Award from the American Academy of Pediatrics (AAP) at the Academy's annual meeting last month in New York City.

Litt was recognized for her leadership in bringing quality health care programs to teenagers in prison. As medical director of the Juvenile Detention Center for the city of New York from 1968-73 and of the Adolescent Reception and Detention Center at Rikers Island Health Services in N.Y.C. from 1974-76, Litt developed a model program which has helped bring about significant changes in prison health care for adolescents.

In her present position at Stanford, Litt has continued to serve as a consultant to detention facilities and prisons on issues of health care.

A week-long exhibit outside the cafeteria area marked Stanford's recognition of National Respiratory Therapy Week, Nov. 7-13. Here, respiratory therapist Margaret Melancy runs a noon hour information booth as interested staff members and visitors inquire and learn about the burgeoning field.

Sokol, 85, dies at home; memorial Thursday

Emeritus Prof. Anthony E. Sokol of the Stanford Department of Political Science, a world authority on the Austrian navy, died Thursday, Nov. 11, at his Palo Alto home following a lengthy illness. He was 85.

A former officer in Franz Joseph's navy, He received Austria's highest civilian honor, the Cross of Honor, First Class, in Science and Art for his 1968 history, *The Imperial and Austro-Hungarian Navy*.

While confined with an oxygen tent 24 hours a day in his bed at home, he continued to write until his death.

Survivors include his wife, Else, and a son from a previous marriage, Otto, a Stanford educated professor of anatomy at the University of Alabama.

Cremation is planned, with ashes scattered at sea. The family prefers contributions to heart and cancer research.

Born March 28, 1897, in Vienna, Sokol received his B.S. degree at Mississippi State Teachers College in Hattiesburg in 1928, and came to Stanford the following year as a teaching assistant. After obtaining his master's and doctorate degrees in German here in 1930 and 1932, he joined the faculty as an assistant professor in 1934.

During World War II, he organized the teaching of Malay languages for the Far Eastern Branch of the Army Specialized Training Program, established at Stanford in 1942.

Anthony Sokol

In 1945, when Stanford organized a new Department of Asiatic and Russian Studies, he was named its executive head, remaining in that capacity until 1957, when the Department of Asian Languages was formed. A research associate at the Hoover Institution, he then joined the political science faculty.

In 1961, his book on *Sea Power in the Nuclear Age* was published. While he reached normal retirement age in 1962, he continued teaching for more than a decade. His 1970 freshman seminar on "The Position of Women in a Historical Society" was one of the first Stanford courses on the subject.

He advised colleagues on establishment of the Stanford study center in Vienna and taught there in 1968 and 1972.

He sent hundreds of books to the Austrian National Library and the Austrian War Archives.

In 1976, he published a book on *The Attempts of the Hapsburg Emperors of the 16th and 17th Centuries to Establish a German Imperial Navy*.

Following retirement, he travelled extensively with his wife and pursued his interests in writing, reading, ships and photography.

Memorial service

A memorial service will be held at 2 p.m. Thursday, Nov. 18, in Memorial Church. Associate Dean of the Chapel Ernle Young will preside.

The eulogy will be given by John W. Dodds, professor emeritus of English and former director of special programs in humanities, a long-time faculty colleague of Sokol.

Med Center Calendar

PUBLIC EVENTS

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, NOVEMBER 17

Basic Science Research Colloquium: "Steroid Regulation of Gene Expression"—Dr. Gordon M. Ringold. 5 p.m., M104.

Dept. of Neurology Grand Rounds: "Some Newer Techniques in Diagnostic Electrophysiology"—Dr. Leslie J. Dorfman. 5 p.m., Palo Alto Veterans Administration Medical Center, Bldg. 7, Room B108.

Clinical Pharmacology Seminar: "Tolerance to Effects of Psychotropic Drugs"—Dr. Stephen Henauer and Edward Gallagher, Ph.D. (of the Palo Alto Veterans Administration Medical Center). 4 p.m., M110.

Div. of Orthopedic Surgery Grand Rounds: "Monteggia and Galeazzi Fractures"—Dr. Frederick Reckling (Univ. of Kansas). 8:30 a.m., M114.

THURSDAY, NOVEMBER 18

Dept. of Dermatology: "Local Facial Flaps"—Dr. Lee Smith. 8 a.m., Dermatology Library, R136.

Dept. of Medicine Grand Rounds: "Pathogenesis and Treatment of Gout"—Dr. Lloyd H. Smith (UCSF). 8:30 a.m., Fairchild Auditorium.

Katherine D. McCormick Lecture: "Obesity: Why the Losing Battle?"—Dr. Judith Rodin. 5 p.m., Fairchild Auditorium.

Dept. of Neurology: First of an annual lecture series on myasthenia gravis—Dr. Daniel Drachman (Johns Hopkins). 5 p.m., M104.

FRIDAY, NOVEMBER 19

Child Psychiatry Grand Rounds: "Children of the Holocaust"—Drs. Jill Armbrust and Peter Oswald (Langley Porter Neuropsychiatric Institute). 11 a.m. till 12:15 p.m., Children's Hospital at Stanford, central conference room.

Dept. of Pathology, Surgical Pathology Conference: "Interesting Infectious Disease Cases"—Dr. Luis Fajardo. 8 a.m., L201.

MONDAY, NOVEMBER 22

Div. of Otolaryngology/Head and Neck Surgery Resident Lecture Series: "Tympanometry"—Ann L. Kuklinski, M.S. and Holly Hosford-Dunn, Ph.D. 7:30 a.m., R117.

TUESDAY, NOVEMBER 23

Dept. of Dermatology: "Differential Diagnosis of Eruption of Diaper Area"—Dr. A. Jacobs. 10 a.m., Dermatology Library, R136.

Progress in Medicine Lecture Series on Sexually Transmitted Herpesviruses: "Present and Future Methods of Prevention and Treatment"—Dr. Thomas C. Merigan. 7:30 p.m., Fairchild Auditorium. The public is welcome.
